STANDING COMMITTEE

ON

EXTERNAL AFFAIRS and
NATIONAL DEFENCE

Chairman: Mr. IAN WAHN

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 26-50

WEDNESDAY, FEBRUARY 12, 1969

Respecting

Policy-defence and external affairs

WITNESS:

(See Minutes of Proceedings)

The Queen's Printer, Ottawa, 1969

STANDING COMMITTEE ON EXTERNAL AFFAIRS

AND NATIONAL DEFENCE

Chairman: Mr. Ian Wahn

Vice-Chairman: Mr. Perry Ryan

and Messrs.

Allmand	Harkness	Macquarrie
³ Anderson	Howard (<i>Okanagan</i>	MacRae
Barrett	<i>Boundary</i>)	Marceau
Brewin	Laniel	Nowlan
Cafik	Laprise	¹ Ouellet
Fairweather	Legault	Penner
Forrestall	Lewis	Prud'homme
Gibson	MacDonald (<i>Egmont</i>)	² Stewart (<i>Cochrane</i>)
Groos	MacLean	Thompson (<i>Red Deer</i>)
Guay (<i>St. Boniface</i>)		Winch—(30)

(Quorum 16)

Hugh R. Stewart,
Clerk of the Committee.

Pursuant to Standing Order 65(4) (b):

¹ Mr. Ouellet replaced Mr. Goyer on February 7, 1969.

² Mr. Stewart (*Cochrane*), replaced Mr. Roberts on February 11, 1969.

³ Mr. Anderson replaced Mr. Hymmen on February 12, 1969.

CORRIGENDUM

Issue No. 24 — Wednesday, February 5, 1969

Evidence:

MINUTES OF PROCEEDINGS

WEDNESDAY, February 12, 1969
(39)

The Standing Committee on External Affairs and National Defence met at 3:35 p.m. this day. The Vice-Chairman, Mr. Ryan, presided.

Members present: Messrs. Allmand, Brewin, Cafik, Fairweather, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Legault, MacDonald (*Egmont*), MacLean, MacRae, Marceau, Macquarrie, Nowlan, Penner, Prud'homme, Ryan, Stewart (*Cochrane*), Thompson (*Red Deer*), Winch (22).

Also present: Mr. Hymmen, M.P.

Witness: Professor Charles Foulkes, Visiting Professor, School of International Affairs, Carleton University, Ottawa.

Mr. Brewin drew attention to an error on page 867 of Issue No. 24 of the Minutes of Proceedings and Evidence. The Committee agreed to the correction.

The Vice-Chairman introduced Professor Charles Foulkes who made a brief opening statement. The Committee agreed to print Professor Foulkes' advance presentation entitled *A Canadian Response To Collective Security* and his biography, as an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix gg*)

Members of the Committee questioned Professor Foulkes on various aspects of Canadian defence policy and in relation to suggestions he had made in his advance presentation.

The division bells rang at approximately 4:50 p.m.

With the division bells ringing and the questioning continuing, the Committee expressed its thanks to Professor Foulkes for his testimony and adjourned at 4:55 p.m. The next meeting will be on Thursday, February 13, 1969 at 11:00 a.m., when the witness will be Professor Michael Brecher.

Hugh R. Stewart,
Clerk of the Committee

EVIDENCE

(Recorded by
Electronic Apparatus)

Wednesday, 12 February, 1969.

The Vice-Chairman: Gentlemen, please come to order.

I regret to inform the Committee that our Chairman, Mr. Wahn, suddenly has been called to Toronto because of serious illness in his immediate family. I have, therefore, been asked to conduct the meeting this afternoon as Chairman, but I find myself in the position of having a previous engagement to be on a panel at 4.00 p.m. Therefore, I ask the indulgence of the Committee, subject to your agreement, to have an Acting Chairman replace me while I am gone for an hour or so. Is it agreed?

Some hon. Members: Agreed.

● 1535

The Vice-Chairman: Thank you. The witness appearing before the Committee today is one of Canada's most distinguished soldiers. As hon. members know, General Charles Foulkes became Chief of the General Staff in 1945 after a long and successful career in the Canadian Army. You already have details of his career.

In 1951 he was appointed as the first Chairman of the joint Chiefs of Staff Committee, a position he held until May, 1960, a period of nine years. His experience in these two positions, covering the period during which Canada's postwar military orientation was formulated and elaborated, has given him a unique perspective from which to comment on Canadian defence policies.

In 1967 General Foulkes was appointed as an Associate Professor of Strategy at Carleton University, and since that time has completed a number of works, including *Canadian Defence Policy in the Nuclear Age*. As a very articulate professional soldier and now a professional academic—a rare but valuable combination—General Foulkes is undoubtedly one of the best qualified persons in Canada to comment specifically on defence policy options open to Canada. He has been asked to address himself today to the question of whether Canadian defence policy should be based on

regional alliances, or whether Canada should seek to follow a policy of neutrality.

General Foulkes—or should I address you as Professor Foulkes?—your written statement has been circulated in advance to all members of the Committee. Perhaps you would like to make a brief oral statement by way of introduction and then answer questions which members of the Committee will want to put to you on the major choice or choices open to Canada in the orientation of its defence policy.

Professor Charles Foulkes (Associate Professor, Carleton University): Mr. Chairman, I was asked why I was appearing before this Committee with a paper headed "Professor Charles Foulkes". I did that purposely because I wanted to appear before the Committee, not as a has-been, but as someone who is continually studying the question of defence and the question of strategy. I find that the students keep you very wide awake in order to answer all their questions on the subject of strategy today.

Mr. Chairman, I have very little to say about the paper. I took the opportunity of reading the evidence given by Professor Yarmolinsky who was before the Committee last week. He described I think very accurately to you the question of flexible response strategy and I do not think it is necessary to elaborate on that subject.

I would remind you that in the third paragraph of the paper I do mention that NATO strategy has gone the full circle from 1950 to 1968. By that I mean that when NATO was first set up in 1949 it was based on the strategy of the Second World War, and that was a strategy of conventional warfare with conventional forces supported by heavy bombardment from the air. However, the plan at that time was for something like 1,000 divisions and 6,000 tactical aircraft. As you know, the European partners could not raise anything like that number of forces. Therefore, it was reviewed and reduced to about 40 divisions, 25 of which were expected to be raised in peacetime and the others raised after the war began.

That was the time—and I want to emphasize this—when Canada took on the present commitments; it was in 1951 when General Eisenhower took over com-

● 1540

mand of the NATO forces. He came to Canada and pointed out at that time that it was absolutely necessary for Canada to make a contribution to the shield forces in Europe to show that North America was really fully behind NATO. He did make the stipulation that as and when the European economy and defence posture had sufficiently increased, the North American forces would come home. That, of course, was only in 1951. I think we should keep in mind that this commitment was made by the St. Laurent government in 1951 in a more or less temporary capacity; that it was prepared to help at that time with forces in Europe and eventually they would come home. But you recall that when the Eisenhower administration came into being there was a reduction or a change in strategy introduced by the United States. At that time the United States introduced the use of nuclear forces, and Foster Dulles introduced the theory of massive retaliation at places of our own choosing. Now, with this type of strategy where you are only required to have a shield or a trip-wire kind of defence, they were able to reduce the number of conventional forces required and place reliance on massive retaliation.

This pleased the Europeans because this took the pressure off raising conventional forces, and it also reduced the kind of stockpiling that was necessary for a 90-day war. However, when tactical nuclear weapons became possible, Foster Dulles changed these ideas on massive retaliation and put more emphasis on the use of tactical nuclear weapons.

However, a few years after that, when the scientists began to examine what could be done with a tactical nuclear weapon, they began to have second thoughts as to whether these were really the kind of things to use in Europe. As a result of this the United Nations set up a committee to look into this whole question of the use of tactical nuclear weapons. The committee issued a report, for which a distinguished Canadian did some of the investigations, Dr. Lewis from Chalk River. They did find, after examining some of the exercises which had been carried out in Europe using mock tactical nuclear weapons, that if about a hundred of those weapons were used—and mind you there are 7,000 of them in Europe today—it would lay waste an area 150 miles long and 50 miles wide. So with that in mind, the United States began to look again at the strategy of using tactical nuclear weapons in the beginning, and this is what really brought them to consider this question of flexible response.

As I mentioned in the paper, the introduction of flexible response forces a close examination of the Canadian commitments, because flexible response real-

ly requires the use of conventional weapons until almost the end of the battle. In other words, as Mr. McNamara describes it, they will not be used until the forces are almost overwhelmed. Therefore, it does require more conventional weapons, and also requires a reserve. As you know, with the kind of professional forces we have in Canada, we can not create a reserve, so that we are not in a position really to carry out the strategy of flexible response, unless the government decides it wants to increase its conventional forces. As you know, we cannot in any way reinforce the brigade in Europe today because there is no equipment, and you cannot get the equipment there in time. So it appeared to me that this was a time when we should have another look at the structure of our contributions. I think the important thing, Mr. Chairman, is to get a consensus on the assumption that I have made, that Canada is not primarily responsible for its own security and that all Canada is required to do is to make contributions to collective defence. If that is agreed to, it makes our problem very much easier because then you can look at what are the best kind of contributions we should make.

I feel very strongly that with the type of professional serviceman we have today, we can reach very high standards of technical and tactical leadership, and

● 1545

we are not making full use of that in the contribution to Europe. We are taking on the task which the conscript in Europe with 18 months training can do, and it seems to me if we are going to make a contribution we should make the best possible contribution and give our forces the kind of job that they can do better than somebody, as I said, who is in for 18 months. That is, Mr. Chairman, the basis of the argument in my paper.

Mr. Winch: Could you outline the efficiency and the technicalities of where you think it should be done?

Professor Foulkes: Well, for one thing I feel that we can operate much better on the flanks than in the position we are in, in the central sector, which can easily be taken over by the Germans with a conscript force. We should be operating on the flanks where it requires a great deal more leadership, where it requires handling of communications and that type of task which is the same kind of task as we would do in North America, and that requires the same kind of forces that we would use in peacekeeping and so forth. In other words, it is getting away from heavy equipment and getting on to a more mobile basis, and I think you would find that the savings that you would make in equipment would be considerable.

Mr. Winch: Then, could I just ask this one question? I was just going to say, does this mean that you

are suggesting a change in the policy of our forces in Europe if Canada remains in NATO? That is basically what you are saying.

Mr. MacLean: On a supplementary question, I take it that this reasoning would not apply to the Air Division. It is the brigade that you are speaking of.

Professor Foulkes: Oh yes. As far as the Air Division is concerned, as you know, this role the Air Division is in now has never been really a very satisfactory role. When this role was first put forward in 1956, the St. Laurent government would have really nothing to do with it, and postponed taking a decision on it. It was only after considerable pressure was put on the incoming government by General Norstad that agreement was reached to do this task.

It has never been a popular task with the public, as far as I can see, and with the introduction now of the strategy of flexible response, with the use of tactical nuclear weapons being postponed a considerable time, if used at all, this role becomes almost one in which they will be destroyed on the ground before they ever get a chance to be used. As I point out in the paper, as you know the Air Division is now being concentrated on two airfields, which makes it much more vulnerable than it was when it was on four airfields. Therefore, this is not in my view a satisfactory task for our Air Force. I do suggest that if we could get the Air Force in another task altogether, with close support and transport so that it could move the suggested mobile force that I have been recommending, it would be a more suitable task, and more palatable. In going around the country, one of the things that I meet all the time is a considerable criticism of Canadian Forces, who are just making a contribution to Western defence, having to be involved in nuclear weapons.

The Vice-Chairman: I have an order of questioners: Mr. Penner, Mr. MacLean—I will put you in next if you wish—and then Mr. Brewin, Mr. Gibson, Mr. Winch and Mr. Cafik. So if we could keep this order, supplementaries will be permitted. Mr. Penner?

Mr. Penner: Professor Foulkes, on page 2 you make reference to the Czech crisis which you state has provided justification for the flexible response positions of our forces in Europe. This point of view is raised quite often, and one of the things we often wonder is how valid is this argument? To what extent can we say that the Soviet threat to Western Europe becomes more obvious because of the Czech crisis? Is

● 1550

it not, perhaps, more accurate to regard this more as an internal struggle within the Warsaw Pact that has very little relevance to the Soviet threat to Western Europe as a whole?

Professor Foulkes: The main reason I was referring to the Czech crisis was in regard to adequate strategic warning. As you know the forces available in Europe on the Western side are about 23 divisions. The Soviet Union has 20 divisions actually in Germany today. Those could be built up to about 40 divisions within a matter of six days. Any reinforcements on the Western side would have to come from moving two brigades back from the United Kingdom to Europe and two brigades from the United States. The fastest that the experts say it can be done is two weeks and it is a question of whether, after watching the way in which the Soviet Union can move its forces around with little notice as it did in the Czech crisis, we would get sufficient strategic warning.

This whole question of whether there is a threat to Europe is one on which there are many, many opinions today. I think we have to bear in mind that when you are trying to assess the threat you have two things to assess. First of all, you assess the capabilities of both sides. This, of course, used to be the cloak-and-dagger job of the intelligence outfits but now that there are satellites around which can take a look at the world every few hours, and because of the practice which has been established in the United States of publishing their strengths, the question of capabilities is not as obscure as it was before. Furthermore, for the expenditure of 10 shillings a year any of you who are interested in knowing what the capabilities are could get from the Institute of Strategic Studies a Military Balance which shows the forces in any country in the world and it is reviewed every year. So there is no question now of being able to tell what the capabilities are of any of the opposing forces.

The other side of this, however, is the question of intentions. This is the one that is much harder to judge than the question of capabilities. In the question of intentions the changing conditions, of course, can change national intentions but because of the risk today of such great destructiveness which the weapons of the super powers possess and the risk of escalation of a minor confrontation developing into all-out nuclear war, most powers will accept today certain things and not take action against them which they would not have thought about accepting 50 years ago. I suggest that if the *Pueblo* incident had occurred 15 years ago there would have been a war but the stakes are so high now that the United States is prepared to negotiate. Therefore while there are capabilities on both sides to wage war in Western Europe I think one would agree that the chances of planned aggression in Western Europe are much less today than they were 10 or 15 years ago.

However, there are still hot spots such as Berlin or Greece or difficulties on the flanks. You might get a situation where uranium is found in some part of northern Norway and the Soviet Union has a feeling that it could snatch off those few acres and that we

would not interfere. Those are the kinds of things which could get us into difficulties. Those are the kinds of situations that might arise and about which I am wondering whether the West will get sufficient warning, sufficient strategic warning to be able to build up their forces as fast as the Warsaw Pact forces can. That is what this paragraph really means.

The Acting Chairman: Mr. MacLean, do you have a question? Mr. Brewin.

• 1555

Mr. Brewin: General Foulkes, if I understand your paper right you reject the idea of neutrality for Canada—I see you are shaking your head—but you do suggest quite a radical revision of our roles to begin with. I am right in that, am I?

Professor Foulkes: Yes.

Mr. Brewin: As I understand it you say we should withdraw our air division because it is highly vulnerable; at least that is one over-riding reason, I take it. Is that correct?

Professor Foulkes: Yes. Not only is it very vulnerable but it is wasting away anyway. It is not being reinforced. They are not buying any more aircraft to replace wastage. It is wasting away. I would just hurry the process.

Mr. Brewin: Yes. Then as far as our ground role is concerned, I understand you to say that we should change from the static role of our brigade in Germany and concentrate on a highly mobile force that could be used in the flanks.

Professor Foulkes: That is correct.

Mr. Brewin: Then I take it that you also say that our antisubmarine role needs to be surveyed, as it were, because of doubts as to whether under present technical conditions it can be effective. Am I right in that?

Professor Foulkes: That is correct.

Mr. Brewin: Then you say—may I put it this way—not these changes as far as you are concerned would not only give Canada a more suitable role but would also incidentally have the great advantage of saving us some money.

Professor Foulkes: That is the intention.

Mr. Brewin: Then at page 11, and perhaps you have really given the answer to this, but I would like it clear, you say:

If it is accepted that Canada is not primarily responsible for its own security, and that all that is required is to provide effective contributions to collective defence, then our contribution should be selective and concentrated on one or two specialized tasks. In this way, the maximum operational element could be provided.

I want to make sure that I understand that paragraph. What do you suggest might be the one or two specialized tasks? You have suggested one very clearly, the mobilized force. Another, I take it, would be a force available for policing the sovereignty of Canadian soil; and one that could be available, I suppose, for peacekeeping operations.

Professor Foulkes: As I state, Mr. Brewin, in my conclusions on page 16, what I tried to do is to suggest a homogeneous force that could do all three tasks in the proportions in which it was required to do them; in other words have a completely homogeneous force in which you could send a battalion off to do peacekeeping, or you could use a brigade here to do exercises ready for the flanks, or if you had to do some other task in NATO it would be this kind of homogeneous force, not separated as we are now with the air division in one part of Germany doing a strike role, the brigade in another part of Germany doing the heavy role in the forward area, and two battalions sitting in Canada waiting to go to the flanks. All those different tasks you get mean that you have to have a different set of schools, a different set of equipment, and these are the ways in which you get into the high costs, as I pointed out. The Strategic Balance shows that Canada really gets less for the money it spends on operational forces than almost any other country in the world. In other words, we are not getting our money's worth.

Mr. Brewin: In your view.

Professor Foulkes: That is in my view. We are getting small packages which require the same overhead as the big packages.

Mr. Brewin: I can scarce forbear to cheer what you are saying. If I may put one more point to you, the way to overcome this is really to change our roles. Is that the advice you are giving?

Professor Foulkes: I would negotiate with NATO for a change of roles. This is not something new. We discussed this way back in 1959. This was thoroughly discussed with General Norstad and agreed to but for some unknown political reason this suggestion was not implemented.

Mr. Brewin: My only comment is that I wish you had done it a long time ago. That is all the questions I have.

The Acting Chairman: Mr. Gibson.

Mr. Winch: I did not mean that.

● 1600

Mr. Gibson: General Foulkes, with respect to this special force, this mobile force that you are recommending, would you advocate, sir, some type of special task force, perhaps airborne troops associated with the air division?

Professor Foulkes: I am suggesting that that job could be done by somebody else and we could do a better job somewhere else.

Mr. Winch: On the flanks.

Professor Foulkes: Perhaps as you know there is in Europe today a mobile force under the Supreme Allied Commander—as a matter of fact in which a Canadian has been commanding I believe up to just a few weeks ago. This mobile force was set up some years ago as the only reserve the Supreme Allied Commander had. He has no troops at the present time; all he has are promises. Canada promises two battalions if they are needed. This is the force that I am talking about. All you would do would be to have, say, a Canadian brigade there permanently. When I say “permanently” I mean six months at a time. This brigade could be doing exercises on either one flank or the other, but they would be there in Europe ready to take on any of these tasks. It is a question of putting forces there permanently and not just having them come from Canada in the two battalions which we have promised. It would of course mean that our air force would be providing the airlift and the air support for that force.

Professor Foulkes: Again, these forces would not be stationed in Norway. I want to make quite clear that when the Norwegians entered NATO they had to sign a note to the Soviet Union because they were under pressure from the Soviet Union at that time about joining a kind of alliance like NATO. Therefore the Norwegians agreed at that time that they would never have any foreign troops stationed in their country permanently. So you could not move a Canadian brigade up into Norway. You could move them for an exercise or, of course, if the balloon goes up then you can move them in there.

Mr. Gibson: Sir, can you give me some idea what proportion of infantry you envisage in this force?

Professor Foulkes: I am suggesting that they would have three battalions. These would be airportable battalions which have a special establishment, a small headquarters and that kind of thing, and very little transport.

The Acting Chairman: Mr. Winch?

Mr. Winch: Mr. Chairman, to a great extent my question has been answered.

General Foulkes, you suggest that our brigade force in Europe is not performing a correct function and should be on the flanks, and that our air force which is strike-recce is basically useless in the military sense. If we stayed in NATO and a change was made and we put our army forces on the flanks, do you anticipate a position of the air force in support of our men on foot or in transport on the flanks outside of strike-recce?

Now I suggest that this force, if it is organized, should all be in Germany in one cantonment, say in Bavaria. If you are going to move the Canadian troops you might as well move them to the best part of Germany, put them in Bavaria where the air force are, and the army would then have a chance at the same amenities that the air force used to be used to. They should be in one cantonment where you would have one set of schools, one set of amenities, and the administrative cost would be very much cheaper. Furthermore, if you only have them there for six months at a time then you could do away with having to move families over there. I do not know what it costs now but I remember looking at this some years ago; it used to cost us \$2 million a year to move families back and forth. That does not increase your military posture one iota. I think once we have the opportunity to station forces in Europe for short times like you could do on this suggestion that I make, then you could do away with the married quarters, with schools and all the rest of it and save a considerable amount of money.

● 1605

Professor Foulkes: Let me make two things clear. I am not suggesting that our brigade in Germany is not doing a good job.

Mr. Winch: Professor Foulkes, in view of your long distinguished fighting record overseas, nine years, the longest record of anyone as Chief of Staff, your continuing interest in strategic studies, is it possible for you to particularize now, because of the important reference from the House of Commons to this Committee to study external affairs and defence policy—particularize for the advice of this Committee what you think should be Canadian defence policy?

Professor Foulkes: Well I thought I had pretty well covered that.

Mr. Winch: No, you have generalized it. Could you do that?

Professor Foulkes: I have tried to point out here that in my view we have really no security problem; what we have is really a political problem. It is a political problem.

Mr. Winch: Sir, that is exactly my reason for asking. You used that term—you said that you had the advice of General Norstad and you said it was a political decision which wiped out an agreement.

Professor Foulkes: Oh no—

Mr. Winch: There was an understanding on Canadian application of forces which had been agreed to by General Norstad which was not accepted because of a political decision. Did I get that wrong?

Professor Foulkes: Well, let me put it the other way. The agreement was made right up to the top on the military side but was never pursued on the political side. In other words, the Supreme Allied Commander had agreed to changing the role of the army brigade. We were only talking about the army brigade at that particular time.

Mr. Winch: Mr. Chairman, perhaps I can put my question in a different way. Because of your military experience and having been Chief of Staff for nine years, can you outline the difference between a defence policy military-wise for Canada and a political decision military-wise—or is that unfair, General?

Professor Foulkes: I do not know really what you are—

Mr. Winch: It is a very important question, but I will understand if you say that you cannot answer that.

Professor Foulkes: What I can say is this. There is no real security problem for Canada to face. I think it would be much easier to have a defence policy if you had a security problem because you could say: "This is required for the defence of Canada". But you cannot say that today because we get our defence now under the United States umbrella and whether Canada had any forces or not we would still be defended. But there are certain things that I think Canada has to do and should do itself. I have pointed out about this new arrangement for the air defence of North America which the United States is going to introduce between now and 1975—an airborne early warning system which, as far as I can see, is going to have to operate from certain bases in Canada. Formerly, when we

made the agreement in NORAD, the Canadian Government insisted that Canada should have control of all air operations in Canadian air space. Therefore, in every operational sector of NORAD which infringes on Canadian air space there is either a Canadian commander or a Canadian deputy commander to ensure the control of air forces—not only if the enemy arrives but if an aircraft gets off course that somebody does not take it on. I think this is one of the important things that Canada has to take a share in if it wants to continue to control its own air space.

Now when we get to introducing this new airborne early warning and control system in which aircraft are going to be operating from Thule in Greenland and somewhere in the Canadian North if Canada agrees, then Canada has to have somebody in those aircraft or provide some of those control aircraft that are going

● 1610

to control Canadian air space. I think this is a field in which it is very difficult to say how much you can do and how much you are going to let the United States do. And this is political, this is not military.

Mr. Winch: It is political and not military.

Professor Foulkes: It is political.

Mr. Winch: May I just ask one more question, Mr. Chairman? I was most interested in the statement of General Foulkes that Canada is not getting value for its expenditure on its armed forces. He has outlined certain aspects where he thinks we are not getting it on the strictly military side.

May I ask General Foulkes, from his experience, if, relative to the number of our armed forces, we have too many chiefs in comparison with the number of Indians?

Professor Foulkes: I did not quite put it that way.

Mr. Winch: No; I know you did not, but I am asking you that way.

Professor Foulkes: In my paper I prefer to put that we should have more horse and less harness; but it is saying almost the same thing.

Mr. Harkness: If I may ask a supplementary, for clarification, about the role of the brigades, I think you said it had been agreed by the military people that this role could be changed. But was not that change in role simply from forward brigade position to a reserve position? There was no mobile flank force at this time?

Professor Foulkes: It was proposed that they go into reserve—

Mr. Harkness: Yes.

Professor Foulkes:—but would be available under the Supreme Allied Commander to be used there, or used on the flanks.

Mr. Harkness: The point is, though, that there was no mobile—

Professor Foulkes: . . . force at that time.

Mr. Harkness:—flank force at that time. It was simply a matter of whether they would be in a forward position or in a rear position.

Professor Foulkes: But they were also going to be a mobile force. This issue, as you know, is referred to in the White Paper. At page 21 it states:

A possible course for Canada would be to withdraw from the commitment to maintain a brigade group on the central front in favour of making a contribution of an air portable force based in Europe and available for employment on NATO flanks. After careful consideration it has been decided that this would not be in the best interests of Canada and the Alliance for several important reasons.

Therefore, it was considered again in 1964.

Mr. Harkness: I think probably Mr. Winch thought that there had been the idea of a mobile flank force and that the Canadian brigade could have gone into that role at the time you mention in 1957, 1958 or 1959; but this was not actually the case.

As I say, my question was just for clarification.

Mr. Winch: I want to make sure of that, though. It was a military decision but not carried forward by a political decision. I believe that is the way you put it, General? The military decision was yes, but the political decision was not to carry it forward?

Mr. Harkness: No; the point I was making was that there was no mobile flank force at this time. The decision was simply whether the brigade would be kept in a forward position or would be back in a more rearward position and available as a reserve for the Supreme Commander, to be used in a more mobile role. I think that is essentially it, is it not, General Foulkes?

Mr. Fairweather: I have a supplementary, Mr. Chairman. I hate to think of a distinguished politician remaining anonymous who had enough sense to say, "Let us try for less harness and more horse". Who was it, sir?

Professor Foulkes: You wonder who it was? He was not a Canadian. I forget his name. He was the U.K.

defence minister in about 1951. I will think of his name.

Mr. Fairweather: Surely he should not remain anonymous.

Professor Foulkes: I have thought of it. It was Emanuel Shinwell.

Mr. Fairweather: Hear, hear.

● 1615

Mr. Cafik: General, first of all, a rather lighthearted remark about a comment on page 4. There is a quote here:

As one former Minister was fond of repeating, there is less chance of rape when there are fifteen in the bed.

I would just comment that I doubt that Czechoslovakia would subscribe to that view. They had quite a few in that bed and they ended up being raped.

To get down to the serious questioning, you made a comment in your oral remarks that in the next few years the United States would be going into an airborne patrol system for early warning and that it would be necessary for them to operate out of Canadian bases.

What would happen, in your view, if Canada did not agree to give them the right to operate out of those bases?

Professor Foulkes: I do not think I said they would have to operate. As I understand the early warning control system—and my information is only what Secretary McNamara told Congress last February—they can operate it from Thule in Greenland and from Alaska. These would be long-range aircraft which could be refueled in the air.

All of you can realize the space between Thule and Alaska. If they could use some air bases in between, such as those on the DEW line, they could do it more efficiently and more cheaply. This may be one of the kinds of contributions Canada may wish to make.

Those airfields are still there and they are not being used; they would have to be improved, but I am sure the United States would be glad to improve them at their own expense.

I also think that the Department of Northern Affairs would be happy about it because it would give employment to the Eskimos up there. This, again, is a political decision, whether Canada wants to contribute to the air defence of its neighbour and be in good standing with the United States.

Mr. Cafik: I believe other witnesses have suggested that in the case of NORAD and North American defence if Canada were reluctant to allow the Americans to use our soil and our air space they would simply walk in and do it. What is your view on that?

Professor Foulkes: That has not been my experience with the United States. In all the dealings we had over setting up the air defence of North America the Americans' attitude—and it was the same relative to the Bomarc—was that they thought it would be better to have those bases up in North America; that they were quite prepared to pay for them; that they were quite prepared for us to do what we wanted about the bases. There has never at any time been any suggestion at all that if we did not agree to this they would come in and do it. I think they have enough problems of their own without trying to take on some more up here.

Mr. Cafik: Yes; I would think so.

My next question relates to your recommended change in the role for Canada within NATO. I am not sure that I am entirely clear on this.

Canada at the present moment has a strike capability in NATO with nuclear tactical weapons, and so on. Do you suggest that this be totally eliminated. Do you suggest that it is outdated for the other forces in Europe, as well?

Professor Foulkes: As you know, the strike bomber forces in Europe have been greatly reduced over the past ten years. As a matter of fact, one of the objections when we started this role was that they were being reduced for other people and brought in more as a Canadian role.

However, as you know, General Norstad had a considerable feeling for the Canadian air force. It was extremely efficient. He felt that he did not want to see this very efficient air force go out of being. As you know, at that time we were doing air defence and the air defence of Europe was being changed because the French were insisting that they do the air defence over their own country. This was where Canada was doing the air defence. Therefore, that role disappeared.

It had always been the desire of the administration that we should have an air defence role because it was thought that if we had such a role we could have the same type of aircraft for Europe as for Canada; but there was no air defence role to carry out.

Norstad did not want to lose the air division and he proposed this role. But relative to the strike role there is now reluctance to use tactical nuclear weapons because of their great destructive power and the possibility that this destruction will take place on our side of the fence. As you can see, one would not want to go to war with the Soviet Union because they were

doing something in Czechoslovakia. We are not going to know that they are going to strike NATO until they come across the border, and when they start doing that it will be a bit late unless you use nuclear weapons immediately. Therefore, the only chance of using nuclear weapons would quite likely be on West Germany; and the Europeans are not very anxious to have even a conventional war fought on their territory, much less a nuclear war; nor do they want to be liberated again, even by Canadians.

Mr. Cafik: In your view, then, NATO would not object to Canada adopting the position that we were going to do away with our nuclear strike force over there?

● 1620

Professor Foulkes: This you would have to negotiate with the Supreme Allied Commander. But we have negotiated with the Supreme Allied Commander before and I am sure they are very anxious to continue to have any kind of contribution from Canada because they are constantly reminded that Canada made this contribution on a temporary basis in 1951, which is 20 years ago, and a lot of people think it is time the forces came home. I do not think you are going to have too much trouble negotiating a change of role.

Mr. Cafik: Do the NATO officials generally agree with your assessment of the Canadian strike force in Europe?

Professor Foulkes: I have not been negotiating with General Lemnitzer so I do not know his view, but certainly we do know that the situation has changed a great deal. You will recall when tactical nuclear weapons were first brought into being it was always expected that the decision to use these tactical nuclear weapons would be taken in Europe, and Mr. McNamara has made it abundantly clear that the decision to use tactical nuclear weapons will be taken in Washington. Certainly it will not be taken in the first few hours of the battle unless it is an all-out attack. If it is, then it will develop into an all-out nuclear war, which is quite a different thing. We are not really talking now about an all-out war at all; it is an incident that happens and you have to take certain action to show that you mean business.

Mr. Cafik: All right then, with your mobile force to operate on the flanks, what size force did you have in mind? You were talking about two battalions. They would both be stationed in Europe, I presume?

Professor Foulkes: I suggest that we have a brigade or three battalions, something like that, in Europe and you might use one at a time on the flank. The flank in Norway is a very—if any of you have been in northern Norway—inhabitable place. It is rough country and

you have to fight on your flat feet and operate where it is very mountainous, rough and cold, and this is a place in which Canada could operate. One thing we should be expert in is Arctic warfare. We should also be expert in operating in rough country and with a small force like that it may mean the difference between whether or not the Soviet Union will try for a *fait accompli* and snatch off a piece of Norway or put pressure on the Norwegians. The Norwegians have a common border with the Soviet Union. They are very vulnerable. They only have a very small force.

Mr. Cafik: So, when you speak of the flank, sir, you are referring to that particular flank.

Professor Foulkes: That is one flank. I think the other flank is also in Greece and Turkey. The situation in Greece, as you know, is very, very uncertain and a situation may develop in the mountains of Greece where it will be necessary to assist the Greeks in putting on a show of force.

Mr. Cafik: In order to attain mobility of this force, would it, in your view, require an enlarging of our transport facilities?

Professor Foulkes: As I understand it, and I got my information from the appearance before this Committee last year of the head of the Air Transport Command, they had an airlift of one battalion and an airlift of one battalion would perhaps be sufficient to operate at that particular time. The more mobility you have, of course, the better the force will be.

Mr. Cafik: So you think you would have to expand the Canadian force?

Professor Foulkes: I do not know exactly what it is today but a battalion lift would certainly be better than what they have today, which is nothing.

Mr. Cafik: Thank you very much, Mr. Chairman.

Mr. Macquarrie: Mr. Chairman, I would like to direct the professor's attention to the paper which was prepared before this meeting. On page 8, the second last paragraph, there is reference to Canada abrogating all its collective defence obligations and proclaiming unarmed neutrality. I presume you are referring there to something such as an enlarged police force and perhaps an extended coast guard. I am referring to page 8, the second last paragraph, beginning with the word "Therefore,".

● 1625

Professor Foulkes: All I was thinking about was the...

Mr. Macquarrie: This would be much less in terms of cost.

Professor Foulkes: Much less.

Mr. Macquarrie: The next paragraph stimulated a considerable amount of interest on my part. It refers to "unarmed neutrality status". Of course, this is something which I neither predict nor proclaim but, for the purposes of this exercise, we must examine. It says here that under these circumstances the United States:

quite rightly would take whatever steps she deemed necessary for the maintenance of her security.

Would you be good enough to elucidate on the sort of steps you had in mind?

Professor Foulkes: No, because I have never given any real serious thought to what the United States would do. This is something that I do not think Canada would ever do, but if for its own security the United States had to take some action, I am sure it would have to take whatever action was necessary. No doubt it would try and get along without bothering Canada. As I pointed out, it will continue to try out its air defences by operating from Thule and from Alaska. It would strain them. If we were to provide some airfields in between they could do it much easier. Of course, I do not think it would improve our relations if we just said we were not going to do anything, and if they could not operate that way and they found it necessary, they might start to negotiate with us for rights to operate from an airfield.

Mr. Macquarrie: I am sure you did not mean that it would improve relations, but this has now become a public document from a very able man. Can we go so far as to suggest that the United States could not—and remain a great power—entertain the idea of an unarmed, neutral Canada?

Professor Foulkes: I do not think any country can remain a great power if it cannot look after its own security. Geography has decided that.

Mr. Macquarrie: Can it look after its own security—to use your words—without denying to this country, which is its northern neighbour and an important one, the status of an unarmed neutral?

Professor Foulkes: It is my opinion that the United States would take whatever actions it felt were necessary. It may feel there is no necessary action it has to take at the present time. You cannot forecast what will be necessary.

Mr. Macquarrie: But you think there would be some steps. I may say, with respect, that I congratulate you for introducing this aspect. So often one reads of discussions of these matters which are geared to the United States being some remote abstraction, which it certainly is not.

I have a couple of further short questions, Mr. Chairman, and then I will be finished. To follow this a little further, I will read from page 10, the last paragraph following Mr. King's quotation:

Canada must not become, through military weakness or otherwise, a direct threat to American security. If this were to happen, Canada would lose her right as an independent nation.

Would you—and I presume you would—equate military weakness with the kind of unarmed neutrality that you discuss on page 10?

I have another question, and this is not to suggest an inconsistency in your paper but perhaps to reveal an inadequacy in my comprehension of it. On pages 4 and 6 reference is made to the bilateral and the multi-lateral performance of Canada. On page 4 you refer to:

... arrangements in collective organizations such as NATO where Canada rates as an equal partner rather than in bilateral arrangements where Canada is very much the junior partner.

This is sort of giving a preference to the multi-lateral. The last sentence of the first paragraph, on page 6 reads:

Canada has been very sensitive about maintaining its sovereignty and in all negotiations for joint defence installation, the matter of Canadian sovereignty has been made unmistakably clear.

● 1630

This leads me to believe that perhaps we are on a more—if I may say so—equal status when we are bilaterally negotiating, and yet from page 4, I thought we were in better shape around a table of 12 or 15.

Professor Foulkes: I drew two examples. When NATO was first formed there was some political pressure on the Chiefs of Staff to take the "anything less" arrangements which had been done under the Ogdensburg rearrangement. As you know, at the end of the war the United States Secretary of War and the United States secretary of the Navy wrote letters to Canada asking that we continue the arrangements for planning the defence of North America in peace time. The government agreed to that, and we immediately planned for the defence of North America under the revised Ogdensburg arrangements. That is what I was referring to.

When NATO was formed the Canada-United States Regional Planning Group was set up and some of our Ministers felt at that time that Canada should get out of the Ogdensburg arrangements and that all its arrangements for the defence of North America—North

America was then part of NATO—should be part of NATO. However the United States Chiefs of Staff did not feel that they wanted to go this far. They placed a great deal of emphasis on the word "permanent", that this was a permanent joint board whereas NATO was only for 20 years and also there was a question as to whether the United States would release to the NATO partners as much of their research and intelligence as they would to Canada because, as you know, there has been, even just lately, some security problems in Europe. This is what I was talking about.

This came up again and you will remember the debates in the House last fall on the NORAD agreement and the question: "Why was not NORAD put under NATO?" This is what I am referring to. There is a feeling, or there was perhaps a feeling among the Ministers at that time, that they could always have a better deal if they were dealing in NATO where they are equals. Yet, when one examines the NORAD agreement, I think Canada got more than it was really entitled to from the United States at that particular time. The Americans, themselves, thought that we had really pulled a fast one.

Mr. Macquarrie: Thank you, Professor.

Mr. Stewart (Cochrane): I would like to ask a supplementary question.

The Acting Chairman: Yes.

Mr. Stewart (Cochrane): Just for clarification, with regard to the term you used "under armed neutrality", is such a thing feasible? Many people when they speak of neutral countries, without being informed, assume that they are virtually unarmed. But, in fact, most countries which have a policy of neutrality, such as Sweden and Switzerland, actually are quite heavily armed relative to their size.

Professor Foulkes: Sweden spends much more money on defence than Canada.

Mr. Stewart (Cochrane): Yes, this is the point I was making.

Professor Foulkes: Switzerland spends just about the same.

The Acting Chairman: Another supplementary, Professor Foulkes. Is there a figure there which shows the per cent of the gross national product that Switzerland spent?

Professor Foulkes: Yes. Sweden spent 4.4 in 1965, and in 1967 3.9 of the gross national product; defence expenditures per capita in Sweden \$125. Canada is quoted here as 3.2 in 1965, 2.8 in 1966 and 2.7 in 1967. Switzerland spent 4.4 in 1965, 4.2 in 1966 and

3.9 in 1967. Remember, however, those two countries have compulsory military service.

● 1635

The acting Chairman: Thank you, Mr. Stewart.

Mr. Stewart (Cochrane): Thank you, Mr. Chairman. General Foulkes, I would like to talk a little bit about the navy. You seem to indicate in your paper that in regard to maritime role our contribution to this is quite obsolete, that we are not really effective in that role, and it is costing us a great deal of money. Would you say that unless we change this whole thing completely and up-date it that it is worthless and therefore should be scrapped?

Professor Foulkes: I was not going as far as that, because I am not a naval expert. I was pointing out that if you assume that the greatest threat from the submarine today is a missile-carrying submarine, then there is no hope, according to the experts—and I quoted McNamara—that we are going to be able to control that type of submarine in the length of time that would be required in any kind of a conflict. Therefore, I think one has to consider—and there is a great debate going on in the United States on this problem—whether they should spend their money in trying to locate and destroy the base which the missile is fired from, which is a submarine, and which is very difficult to find now because the methods of operating submarines are such that we can always get now, or can achieve in the next few years a quiet submarine. As you know, our location equipment is all based on our being able to pick up the sound from the submarine and therefore the chances of locating it are getting less. In that case, is it better to try and get the platform or try and get the missile after it leaves the submarine? This is what is being debated in the United States today.

I do suggest that even if we stay in this role that we should have a pretty good look at our hardware. I even quoted what I said to this Committee in 1962. We presently have one carrier and I do not believe one of anything is any good to anybody. I think the present carrier has been out of commission for a year, and I do not know what has been taking its place. I did ask somebody the other day whether the United States had loaned us one but I found they had not done so and therefore we apparently for a whole year have been getting along without it. We saw the other day what it is costing to refit it. Our present group of equipment consists of a carrier, and tracker aircraft, and as you are aware, this carrier we have is too short to take jet aircraft. Therefore if you are going to stay in this field you really should get out of the present carrier, and get one big enough to carry jet aircraft. It can only operate really as a helicopter carrier. Also, the ships we are building are slower than the sub-

marines. So that even though they locate the submarine, they will not be able to catch up with it. Therefore I am suggesting, not that we should do away with it, but we should have a pretty close look at it again. I have suggested that it should be subjected to a systems-analysis study where this would be studied in terms of what value you are getting out of it for each dollar you spend. Which is the most valuable—a helicopter on the back of a destroyer or would it be better to have 12 helicopters on the carrier? If our destroyers are only useful to carry one helicopter, that is a pretty expensive way of carrying one helicopter around. Surely we would be better if we had another aircraft carrier capable of carrying 14 or 20 helicopters. These are the kind of things which should be examined in a cost effectiveness study where you would see what you are getting for every dollar you spent on this role. It might give an indication as to where you go in the future.

Now, as I pointed out in this quotation, all we seem to do is replace one ship with another ship. But are we sure that we need a ship or are we sure that we want more helicopters or should we save all our money and go for killer submarines? A recent expert in the United States pointed out that the only real anti-submarine weapon was a killer submarine. Now, if that is true, what are we doing with all this other hardware? I think this should be fully investigated. You may find that we are not getting very much value for the \$280 million we spent. At least I think that we should find out. The ways and means of doing cost effectiveness studies are available now and it seems to me this should be undertaken so that when Ministers and this Committee and so on have to make a decision they can be provided with all this information.

● 1640

Mr. Stewart (Cochrane): Thank you very much; I tend to agree with you 100 per cent. The point is that the antisubmarine role is somewhat dubious even in the context of the whole continent, and the United States certainly has modern equipment. But in the case of Canada it seems somewhat ludicrous, as you say, with one aircraft carrier, and so on.

I wonder whether you could give us some idea of what you think the priorities would be for our role in defence, General? For example, suppose we have to cut back somewhere and we have to knock out one, two or three of the roles we are playing; how would you line them up in order of importance? For example, would you have NORAD first, NATO second, antisubmarine or peacekeeping third—this kind of thing? Suppose we have to chop off one or two at the bottom, or even three?

Professor Foulkes: I do not think you can answer that question just off the cuff. I think you would have to go into it a bit more thoroughly and find out

exactly what these various roles were and what they were costing.

I think you would find that if an estimate were made of what it would cost to operate a changed role in Europe you might save sufficient funds to be able to do some other role.

My own preference—and I think this does kind of stick out a mile—is that we should co-operate in the defence of North America, and I would say that is more or less priority one. As I have pointed out before, we went into Europe at a time when it was necessary to raise the morale of the Europeans, but their morale, their military posture and their economic position is such that they really should be able to look after their own territorial defence, and that was the original notion of NATO.

The original idea of NATO was the North America would provide only reinforcements and strategic bombing. There was no suggestion originally that Canada—or even the United States—should put forces there. But as far as Canada is concerned, you cannot really make a case. We have to have forces there unless there is some political question that I do not understand.

Mr. Stewart (Cochrane): So certainly NORAD would be number one.

Professor Foulkes: I would think it would.

Mr. Stewart (Cochrane): Would you place the anti-submarine role down at the bottom of the list?

Professor Foulkes: I would have to have a pretty good look at it to see just how much this kind of role is contributing to the defence of North America. I have some grave doubts about whether it is contributing very much at the present time.

Mr. Laniel: I have a supplementary on that, Mr. Chairman.

The Acting Chairman: A supplementary, Mr. Laniel?

Mr. Laniel: When you speak of antisubmarine warfare, though, you are speaking not only of destroyers and aircraft carriers; you are also speaking of aircraft. Did you get the impression, as some of us did when we went to Halifax and really found out there, that the real protection given to Canada by this role is mainly fulfilled—well fulfilled—by the air force? Could the air force not meet your requirements of re-evaluation, the purpose or the target of an ASN role?

Professor Foulkes: That is why I suggested there should be a thorough examination to find out just what value you get, because there is quite a difference

in price between an Argus aircraft or the replacement of the Argus.

Mr. Laniel: It could be something other than an Argus.

Professor Foulkes: I think we want to get a little closer to see what we are getting per dollar we spend on the antisubmarine role. As I understand it, the Argus is nearly 10 years old now and it will soon need replacing, so these questions about the re-equipping of this force are bound to arise I would say, within the next few years.

It seems to me that one should have a very close look at every element in it, and dollar for dollar just how much value all these different elements in locating the submarines are. You may find that none of them is really satisfactory.

● 1645

Mr. Stewart (Cochrane): General, I do not know how intimate a knowledge you have of the Navy's role at present, but a year and a half ago I had the opportunity of seeing the aircraft carrier just after it had come out of its repairs, and they were doing manoeuvres where frogmen had to go under the sea and do certain things. What does this have to do with the defence role; could you enlighten us about that?

Professor Foulkes: I do not know what the frogmen would be doing unless it was thought there was some sabotage or . . .

Mr. Stewart (Cochrane): This was a three-month exercise. Of course, it was a nice time of the year to be down in the Caribbean, but I wondered if there were some specific reason for this that has to do with our defence.

Professor Foulkes: Offhand I could not think of any. I agree the Caribbean is a good place to be. As a matter of fact, and perhaps as you know, we had great difficulty once because we found our icebreaker was down in the Caribbean instead of breaking ice outside Seven Islands.

Mr. Winch: Mr. Chairman, may I add I was on board the *Bonaventure* for a week on an exercise and I went through all the exercises except one and that was when—you call them frogmen, they call them scuba divers—they went down from the *Bonaventure*, and they went down to repair a leak on a propeller of the *Bonaventure*.

Professor Foulkes: I do know that the Navy can crack ice without an icebreaker.

Mr. Harkness: General Foulkes, you said in your opening remarks that you proceeded on the assumption that Canada did not need to look after her own security and this put us in a much easier position as far as deciding what military roles we would carry out is concerned. I would somewhat question that assumption. Would you not agree that we have to look after our own security in so far as maintaining control of our own land air and surrounding waters are concerned?

Professor Foulkes: Yes, but I do not look at that, really, as security. I look at that as maintaining our sovereignty. I may be . . .

Mr. Harkness: This is the very point I was getting at. In order to maintain any pretense of sovereignty and control over our own land, air and water we must have some defence forces and that, in my view, is part of maintaining our security.

Professor Foulkes: But I think, Mr. Harkness, I did point out on pages 7 and 8 that we did need forces if we are going to be able to do surveillance in the Arctic, to make sure we still have possession of the Arctic Islands, and also that the fishing fleet, the armed trawlers, are going to need some support, and if we start to do exploration on the continental shelf there will have to be enforcement authorities there as well, and it seems to me that you could arm a trawler but if somebody is determined to take things away, an armed trawler will not be much good to you.

Therefore, I am not trying to make a case that there is no reason for internal security. I was looking at security in its bigger aspect; that is, from aggression outside.

Mr. Harkness: Well, this is a point but I think there might have been some misconception that we did not need to maintain forces even for these purposes but, as I say, you are talking of security from the point of view of a large-scale war or something along that line, but as far as minor incursions are concerned—which, in my view, is part of our security and as you have pointed out in your paper—we have to maintain forces for that purpose.

As far as security in the sense that you were talking about is concerned, I think you would agree that we secure that security by the alliances we enter into, particularly the NORAD agreement with the United States and our membership in NATO, and I am glad to see as far as your paper is concerned that you are in favour of maintaining those alliances, because I think this is the only way in which our over-all or basic security can be looked after.

Now when it comes to the matter of NATO, I suggest that the savings you have said you think might be arrived at by a change in roles may be somewhat il-

lusory. Of course, I think everyone agrees that there has to be a change of role and a change of commitment from time to time, particularly as conditions change. As equipment becomes obsolete, and so forth, you have to have a change in role and a change in equipment. I think everybody realizes that, but I would be somewhat doubtful that there would be very much saving of funds as a result of the change in role which you have suggested.

On page 13 you say:

It is suggested that the strike squadrons should be converted to a ground support and transport role for the NATO Mobile Force.

This, of course, would be a big re-equipment program which would take probably at least two or three hundred million dollars.

Professor Foulkes: The CF-5 is being manufactured already; I do not know how much they have paid for it.

● 1650

Mr. Harkness: I know, but it is no good as a transport plane.

Professor Foulkes: No, but it is only used as ground support.

Mr. Harkness: Yes, but you are saying that it should be converted to a ground support and transport role.

Professor Foulkes: That is right, ground support.

Mr. Harkness: As a matter of fact, for a mobile role I think there is no question we need a great deal more air transport. What I am suggesting is that with changes of this kind, while I am not saying they are not desirable—in fact I think that changes are desirable—I doubt very much whether there is going to be a great deal of saving of money as a result.

Professor Foulkes: Well, the main point of my argument is that you would have a homogeneous force. You would not need to have a heavy tank school; when you shut the school up you would not be buying tanks and you would not be dealing in heavy artillery. There would be a whole lot of schools and things you would close up because you would only have one type of force to train. When you come into these multi-various bits of training you need three staff offices in Ottawa, to wit each command kind of thing, a special school to carry out their special training, and the more you go into the various fields, the more you have to put into administration and back up the training establishments. The simpler you get it the cheaper it is.

Mr. Harkness: I agree with the general concept that the simpler you get it the cheaper it is, but I think

with any sort of balanced mobile force you are going to have some type of artillery in it. It will be a light transportable type of artillery, it is true, but you will still need to maintain an artillery school and so forth.

Professor Foulkes: But you are quite likely to go for weapons that are not heavy weapons because this force has to be airportable.

Mr. Harkness: Yes, but any modern, up-to-date, air-portable force has to have some type of artillery. This is just one of the essential arms of an effective mobile brigade. I was just putting out the point that I do not think the Committee should be left with the idea that

a change of role such as you have suggested is going to save us a great deal of money. I would be very doubtful myself on the basis of my own experience whether it would.

The Acting Chairman: Gentlemen, I think we all regret that this meeting has to be cut short due to circumstances. I know we are indebted to Professor Foulkes for his very informative paper and evidence based on his many years of experience and service to the country. On this note I think we will have to adjourn and go to the Chamber. Would the Committee agree that we print Professor Foulkes' advance presentation as an appendix to our minutes?

Some hon. Members: Agreed.

APPENDIX GG

A CANADIAN RESPONSE TO COLLECTIVE SECURITY

by Professor Charles Foulkes

At their meeting in Brussels in December, 1967, the North Atlantic Council adopted the strategy of flexible response, with an immediate demand for an increase in conventional forces and the raising of the threshold of tactical nuclear involvement from the combat level to the top of the totem pole.

The exhortations and pressure exerted by Mr. McNamara no doubt raised the quality of the conventional forces, but because of French withdrawal and the reluctances of the other partners, the requirement of the conventional forces fell below what the Supreme Allied Command regarded as necessary to implement NATO forward strategy.

However, in his last presentation to the Senate Armed Services Committee in February last year, Secretary McNamara stated:

"The greatest deficiency in the European NATO forces however, is the lack of adequate mobilization bases. We, in the United States have made great progress in raising the combat readiness of our own reserve forces and in providing the means for their movement, and, I believe, it is most urgent that our European Allies do likewise. By adopting such an approach, the flexibility of the NATO force structure could be greatly enhanced."

You will notice that NATO strategy has gone the full circle from 1950 to 1968, and NATO is back now where it was at the beginning, relying on conventional forces and looking to strategic warning and rapid mobilization to fill the gap between what is required and what the NATO partners are prepared to provide.

No doubt there are some here who will challenge placing such reliance on adequate strategic warning and the ability of NATO to mobilize as fast and as efficiently as Warsaw Pact nations. The recent Czech crisis has provided good enough reason for reconsideration of this theory.

The two aspects of the strategy of flexible response that affect Canadian participation are the necessity to increase conventional force contributions in Europe, and secondly, the establishment of an effective mobilization base. Any substantial increase in the ground force contribution would really involve building up the brigade group to a full division. Canadian insis-

tence in maintaining the identity of its contributions would not tolerate providing, for example, an additional brigade or a few extra battalions to bolster up a British division. But to increase the contribution to a division would entail manpower increase from 6,000 to about 20,000, trebling the equipment and maintenance cost, which is even now exceeding \$45 million. Furthermore, I understand that instead of increasing the conventional commitments, certain quarters in Canada are suggesting a reduction.

Secondly, to re-establish an effective mobilization base would be of little use in producing reinforcing formations quickly, because the professional forces in Canada do not produce trained reserves.

These requirements raised by the implementation of flexible strategy highlight the need for an immediate re-appraisal of Canadian force contributions.

However, before leaving the question of ground force contributions, may I leave this thought with you to ponder over: "Are we exploiting to the full the merits and enhanced capabilities of a professional force when assessing Canada's best contribution to collective defence." In a professional force, it is possible to attain much higher standards of technical, tactical, and leadership skills. In such circumstances, Canada should undertake military tasks which require enhanced skills and proficiency in handling complicated equipment and techniques, and leave to the short-term national service forces the traditional static ground force roles. I will come back to this thought later.

Let us look at the Air Division. The strategy of flexible response imposes a considerable delay in the use of nuclear strike weapons, and as such increases considerably the vulnerability of the nuclear air strike squadrons. This vulnerability has been increased further by the intransigent attitude of De Gaulle, which has forced the crowding of the Canadian nuclear strike squadrons on two bases in Germany. These two bases are well within Medium Range Ballistic Missile capability and may be already targeted for immediate destruction in the initial stage of an encounter while the aircraft are still on the ground. While these aircraft have been given a limited conventional strike capability, the usefulness and viability of this contribution is only marginal. No arrangements

have been made for replacement of wastage, therefore this contribution is wasting away by attrition.

Now let us look at North American defence. The defence arrangements in North America have been influenced more by the rapid technical development than by changes in strategy. The development of the extensive bomber defence system over the past twenty years has created many problems, some of a political nature involving sovereignty, control of aircraft carrying nuclear weapons, and the protection of the Eskimos and Indians, etc. There were also problems of command control, which terminated in the establishment of NORAD in 1958.

However, the quite frequent blasts from the Soviet Union, castigating Canada for supporting the operations of the U.S. nuclear strike forces, and referring to Canada as a satellite of the United States, have caused uneasiness in the political sphere. The vicious Soviet attacks, which were usually echoed by anti-American elements here, have influenced the politicians to prefer negotiating defence arrangements in collective organizations such as NATO where Canada rates as an equal partner rather than in bilateral arrangements where Canada is very much the junior partner. As one former Minister was fond of repeating, there is less chance of rape when there are fifteen in the bed. This contention was raised at the time of the formation of NATO in 1949, when there was some political pressure to transfer the defence arrangements concluded under the renewed Ogdensburg agreement to the Canada-United States Regional Planning Group of NATO, and again during the debate on the NORAD agreement in Parliament in 1958. However, the U.S. authorities placed a great deal of emphasis on the permanent aspect of the Joint Board on Defence, whereas the NATO treaty was a twenty year agreement. The U.S. Chiefs pointed out that there was also the possibility of a much wider exchange of intelligence and technical information on a bilateral basis than in an alliance of fourteen or fifteen partners, where security may be doubtful. Therefore, North American defence planning has remained under the auspices of the Permanent Joint Board on Defence, which appears to be in line with the present official trend in defence planning.

The decreases in the bomber threat and its replacement by the strategic ballistic missile has considerably reduced the importance of Canadian real estate and air space in U.S. security planning. However, the proposed revised bomber defence scheme, which involves the use of air-borne early warning and control aircraft and high performance interception aircraft, will no doubt involve Canada in new joint defence arrangements. In fact, in Secretary McNamara's testimony before the Senate Armed Services Committee, he mentioned that "the Canadian government had already indicated that it intends to continue its cooperation in the air defence of the continent." To what extent this cooperation involves Canada has not been revealed. However,

in the past, by making effective contributions to collective defence, Canada has sought, over the past twenty years, to maintain her standing in NATO and with the United States and to continue to have an effective voice in the formulation of the security of the West.

On the other hand, during the recent Canadian election campaign there were frequent references to reductions in force contributions, and suggestions for the withdrawal of Canada from NATO and NORAD. It has been revealed recently that these matters of partnership in NORAD and NATO are under active consideration.

With this in mind, it appears timely to look at the various alternatives in the light of the observations I have made regarding the effects and requirements of the new strategy.

One of the hardy perennial alternatives is the issue of neutrality. For some years there were several groups who continued to clamour for all the Canadian armed forces to be placed under the United Nations for peacekeeping purposes. As succeeding Secretary Generals have turned down such offers of permanent U.N. forces, this aspect of neutrality has fallen into disuse. However, a new neutralist proposal is being advanced which is quite popular with some academics and politicians. This group considers that the greatest threat to security is the unstable condition in the undeveloped countries. Furthermore, they express the view that the security of Canada would be served better by devoting the \$1.7 billion to the welfare of the undeveloped countries than by being spent on our present armed forces. I do not intend to go into all the ramifications of aid to developing countries, which of course has a prominent place in the government program, but I would like to point out that there are some aspects of the defence of Canadian sovereignty which cannot be neglected if Canada is to continue in undisputed control of all Canadian territory. Canada has been very sensitive about maintaining its sovereignty and in all negotiations for joint defence installation, the matter of Canadian sovereignty has been made unmistakably clear.

On the other hand, I believe that the Canadian claim for ownership of the Arctic islands is still not beyond dispute. I was informed recently that even some of the U.S. maps show the Arctic islands within the Canadian sector as "disputed territory." I believe that the U.S. does not subscribe to the sector principle; furthermore, there is some doubt that Canada can lay claim to all the islands on the grounds of discovery or occupation. You may contend that sovereignty over these millions of acres of ice and snow is of little importance. However, very extensive exploration for oil and minerals is already underway. The Department of Northern Development announced recently that "A total of 50.3 million acres of exploration permits have been acquired in the High Islands

and in the Arctic offshore areas." If valuable strikes are made and important minerals are found, ownership and sovereignty may be challenged, and indeed some of the areas might be occupied and remain unobserved for many months unless constant surveillance were undertaken.

I would remind you that this is not a new problem: it was very much in evidence in the critical days of the late forties and early fifties. You will recall that Soviet pressure and intransigence was at its height at this time. The United States became concerned about the possibility of the Soviet Union establishing refueling bases in the Arctic in order to facilitate two-way bombing missions against the United States. Air surveillance by the USAF revealed Soviet occupation of two ice islands drifting about in the Arctic Ocean. Air photographs revealed that each island was equipped with tents, shelters, stockpiles of oil drums, and a short rough runway. From further observations it was concluded that the occupants were scientific personnel carrying out observations of the Arctic Ocean. Although the rough air fields were not long enough to accommodate bomber aircraft, it was not beyond the capacity of present knowledge to extend such ice islands for bomber aircraft use. Actually, the idea of ice airfields was developed during the last year of the war, under what was known under code word "Habbatuk project," where it was proved quite feasible to construct an ice island of a combination of sea ice and sawdust strong enough to support air operations for limited periods of the year.

Thus, as exploration of the Arctic develops and new techniques open up ways and means of delivering the products of the Arctic to market, the necessity for surveillance, control, and policing arise. Sovereignty imposes the obligations of protection and control, as well as the functions of collecting royalties from exploitation.

Similar means of enforcing sovereign rights are required to establish and maintain the twelve-mile fishing limit in both oceans. Furthermore, the development of off-shore exploration on the continental shelf will establish a need for active enforcement authorities in the Atlantic and the Pacific. Even peace-loving NATO partners have been known to make belligerent gestures at one another over fishing rights.

Another aspect of the need for a military presence is in the field of internal security. I am well aware of the rather smug attitude of many Canadians to the question of Civil disorders. Some consider that Canada has taken such an enlightened attitude toward social and racial problems that, while there are civil disorders in other places, it won't happen here. I would remind you that this has not always been the case. In the early twenties the underlying reason for establishment of the permanent army was to be able to deal with increasing prevalence of civil disorders. While I am sure

we all hope that Canada will be spared the ordeal of civil unrest, it would be unsound to ignore the possibility and the need for means of controlling any outbreaks of violence.

Therefore, if Canada was to abrogate all its collective defence obligations and proclaim unarmed neutrality, there are certain aspects of maintaining Canadian sovereignty and control over its territory and territorial waters which are incumbent on every sovereign state and require armed forces.

The final aspect of any unarmed neutrality status is the attitude and reaction of the United States. There is little doubt that our neighbour would be quite disturbed by any such move, and as a great power, the United States quite rightly would take whatever steps she deemed necessary for the maintenance of her security. It must do so, or cease to be a great power.

Perhaps I should explain by means of an illustration. You will recall that in the early fifties the United States was heavily committed in Korea and was faced with a threatening situation in Western Europe, where the only troops available to withstand any Soviet threat were the occupation forces. The Soviet Union had exploded an atomic device several years earlier than had been expected, and although the United States had a four-or five-year lead, there was concern that the Soviet Union would take every measure to catch up to the United States. In such a race, it was considered that the Soviet Union might take any action it could to interfere with U.S. atomic production. During this period, a considerable amount of uranium required for U.S. production was obtained from the Eldorado Mining Company at Great Bear Lake, within easy reach of the Soviet bases in the Kamchatra peninsula. The U.S. Chiefs of Staff pointed out that the production of this mine was vital to U.S. security and that steps must be taken to protect the mine complex from any Soviet air attack by mounting heavy anti-aircraft artillery defence of the area. It was pointed out that if Canada was not able or prepared to establish the anti-aircraft protection, the United States would press for permission to do so. This was a difficult commitment in a most remote area under arctic conditions. Because of the remoteness of the area and the severity of the conditions, frequent rotation of troops would be necessary and many new problems would arise. On the other hand, it was considered untenable to allow U.S. forces to defend a Canadian installation over a prolonged period. However, during the investigation of the problem with the company, it was found that the only vulnerable structure above ground was the derrick. If this equipment was destroyed, the mine could not operate, but the mine management agreed to construct an alternative derrick and to conceal it some distance from the present mine shaft, but readily available if required. The U.S. Chiefs were assured of the continued production of uranium and the issue of anti-aircraft protection was dropped. However, I sug-

gest that the incident shows quite clearly that no nation can afford to ignore any matter which its neighbour considers is vital to its security.

It seems necessary to occasionally remind ourselves that the security advantages which we accrue from the shade of the U.S. umbrella imposes also obligations. Recent events in Czechoslovakia have shown the hazards of living within the orbit of the Eastern super power, and that demonstration should provide sober reflection for those who complain so vocally about privations and perils of our geographical position.

The obligations implicit in sharing the North American continent can perhaps be best summed up by a statement made by the late Mr. King, who by any stretch of imagination could not be described as militant. This is what he said in 1938:

"We, too, as a good friendly neighbour, have our responsibilities, one of them is to see that our country is made immune from possible invasion, as we can reasonably be expected to make it, and that should the occasion ever arise, enemy forces should not be able to make their way, either by land, sea, or air, to the United States across Canadian territory."

These are not idle words; what Mr. King said was that Canada must not become, through military weakness or otherwise, a direct threat to American security. If this were to happen, Canada would lose her right as an independent nation. Therefore, according to Mr. King's dictum, if Canada wishes to abrogate its collective defence commitments and go it alone, one of the elements it must provide is the facility to deter and prevent air and missile attacks over Canada en route to the United States. The realization of such a responsibility should cause a close examination of the merits and advantages of the present collective defence arrangements.

In searching for alternatives to the present contributions to collective security, one is struck by the meagre operational forces Canada produces for the \$1.7 billion it spends. In the current issue of the *Military Balance*, produced by the Institute for Strategic Studies, Canada is shown as producing a smaller quota of operational forces for the amount of money spent than almost any other power. There are of course many contributing factors causing this dilemma.

After the last war, the Canadian forces were set up on the basis of the British Services, with the whole array of headquarters, training establishments, schools, and depots, just like a great power, but with the operational forces very much in "miniature." The integration exercise has eliminated a great deal of the duplication and redundant staffs, but the multiplicity of combat tasks involving increasing arrays of expensive equipment still remains. We seem to wish to dabble in every aspect of military endeavour. It is this wide diversion of military tasks with the accompanying

array of schools, training establishments, and equipment that minimize the effective size of our contributions. Monty once remarked that what it cost the Canadians to provide a brigade, the Turks could field a corps of two divisions.

It is accepted that Canada is not primarily responsible for its own security, and that all that is required is to provide effective contributions to collective defence, then our contribution should be selective and concentrated on one or two specialized tasks. In this way, the maximum operational element could be provided.

Let us look first of all at the contributions in Europe. As I mentioned earlier, the brigade group in the traditional ground role is wasteful, in absorbing in a mundane role the higher standards of technical-tactical and leadership skills available in a professional force. It is suggested that Canada should hand over the traditional ground force role to the British or to the Germans and re-organize the Brigade as a mobile formation, available to the NATO Mobile Force already organized in Allied Command Europe and at present under Canadian command, but without any troops, just promises of forces if and when available. Canada has committed two battalions to this force, but they are stationed in Canada, and I firmly believe that a Canadian presence is still desirable in Europe for some time to come, and here is a real opportunity for Canada to concentrate its effort in Europe in one meaningful role in NATO, instead of three rather dubious commitments.

Such a contribution, based on mobile equipment, could be built up to a full division in an emergency in a short time, by air reinforcement. This kind of role would suit Canadian aptitude, training skills, and advanced leadership and would provide the necessary flexibility to meet U.N. peacekeeping roles as well as re-inforcing Europe on the Northern flank under arctic conditions or in the mountains of Greece or Turkey, or anywhere else where a NATO presence was urgently needed. Such an arrangement would open up the possibility of frequent rotation and eliminate the need for married quarters, schools, and other expensive impedimenta. Under such a plan, it would not cost any more to keep the troops in Europe than in Canada, but would be providing a more useful and flexible contribution at less cost and manpower than the present arrangements.

As I mentioned earlier, the present nuclear strike role is of doubtful and diminishing value under today's strategy; in any event, it is an undesirable contribution that is wasting away. It is suggested that the strike squadrons should be converted to a ground support and transport role for the NATO Mobile Force. As and when the re-organization of these revised roles is implemented, it would then be possible to concentrate all the Canadian elements in one cantonment in Ger-

many, with one administration and one set of amenities, and thus economize on administrative costs.

In North America, the problem is mainly concerned with the implementation of the new airborne early warning and interception system which I mentioned earlier. It may be beyond the capacity of the Canadian defence effort to undertake the provision of all the facilities which may be required on Canadian territory. Therefore, the problem that will arise is just what proportion of the system will Canada provide, and what part, and under what conditions Canada will agree to the United States establishing air defence installations on Canadian soil and to operate in Canadian air space. Perhaps I could make one observation about this aspect of the problem. In the NORAD set up, at each sector headquarters which controls air operations in Canadian air space, the commander or the deputy commander is a Canadian. Therefore I would presume that, in order to continue to exercise control of air operations in Canadian air space, Canada will wish to participate in an authoritative manner in this new system of airborne control of air operations.

It is worth noting that the United States has so arranged its limited anti-missile project so as to avoid the use of Canadian air space and territory, and therefore eliminate any delay or adjustment by having to negotiate with Canada.

However, if the proposed Anti Missile Project is expanded to cover certain cities, some problems may arise in arranging protection of border points such as Detroit, where the siting of the "Sprint" missile and protection from fallout will no doubt require Canadian attention. It will also raise the issue of whether, if it is vital and possible to defend Detroit, what about Toronto and Montreal.

I firmly believe that Canada should take as active an interest as possible in Anti Ballistic Missile Project, so that technical and tactical information can be collected on questions of early warning, fallout, border points, and other matters of pertinent value to Canada.

The last question, which I have not touched on because it does not seem to be effected by the strategy of flexible response, is the defence against the missile launching submarine. Anti-submarine warfare is an activity where Canada and the United States have cooperated very closely for many years, but is also a problem which seems to defy adequate solution.

As Mr. McNamara admitted when discussing counter force strategy, and I quote:

"We know no way to destroy the enemy's missile submarines at the same time. We do not anticipate that either the United States or the Soviet Union will acquire that capability in the foreseeable future."

Most of the experts content that current submarine development indicates that an almost silent submarine is obtainable in the future. As the present methods of locating the submarine are based on acoustic devices, the problem of locating and tracking the nuclear submarine becomes almost impossible. Therefore, unless there is a scientific breakthrough in the means of locating the submarine, the advanced methods of destruction are not of much avail.

There is a school of thought which maintains that, as the present methods of locating the submarine are unrewarding, anti submarine activities should be abandoned and the funds devoted to furthering the development of means of interception and destroying the warhead on its way to the target. It is appreciated that the time of flight of the submarine-launched missile may be quite short, but the proposed ABM system is expected to have a limited capacity to deal with the Polaris type missile.

When giving evidence before this Committee in 1962, I stated the following:

"I am not convinced that we really know what is the most efficient and economical anti submarine force for Canada. There has never been, as far as I know, an unbiased assessment of the relative value of carriers, tracker aircraft, frigates, submarines, helicopters, and long-range maritime aircraft in this anti submarine role. What has happened is that we have replaced the Magnificent by another carrier. the wartime frigates one for one with a \$30 million (I understand that figure is out of date) relatively slow escort vessel. The Lancasters have been replaced with Argus maritime aircraft which need another replacement by 1970. But is this conglomeration of a carrier, tracker aircraft, frigates, helicopters, and long-range maritime aircraft the most efficient, effective and economical grouping for this task? Or is this grouping just a collection of the plans and ambitions of the air force and naval planners I suspect it is?"

In 1969, a lot of the equipment mentioned above is much nearer obsolescence, and the question of its replacement is no doubt arising already. This maritime role costs somewhere in the vicinity of \$280 million; a major re-equipping program would increase considerably the funds required for this activity. As I understand that systems analysis studies are being introduced into the planning procedures at National Defence, it would appear timely to subject the maritime role to a complete system analysis in preparation for objective decisions on its future.

To sum up:

1. The changing NATO strategy which emphasizes the requirement for increased conventional forces, including ready reserves, highlights the need for a reassessment of Canadian contributions. In such a

re-appraisal, full cognizance should be taken of the higher standards of technical-tactical and leadership skills which are obtainable in professional forces.

2. As there are some areas of doubt in the present anti submarine role, it is considered timely and prudent to subject this maritime activity to a complete systems analysis study.
3. There appears to be little to recommend and much to deprecate in any form of neutrality for Canada, but more meaningful and more economical forms of contributions are available if more deliberate thought is given to devising the best possible overall contributions and completely dismissing the notion that the Canadian forces should dabble in all the multifarious forms of military endeavour. Much greater flexibility could be attained if a completely homogeneous force was organized, so that the same basic type of force could be used in various strengths in Europe, North America, with the U.N., or in the arctic. As one distinguished politician remarked, "Let us try for less harness and more horse."

General Charles FOULKES, C.G., C.B., C.B.E., D.S.O., C.D., etc. Former Chairman, Chiefs of Staff

General Foulkes was born in England in 1903, educated in London, Ontario, and was commissioned in the Royal Canadian Regiment in 1926. Following his tour as a regimental officer, he held various staff appointments in Military Districts in Ontario. He graduated from the *Senior Staff College at Camberley, England*, in 1938. In November, 1939, he was appointed Brigade Major, 3rd Canadian Infantry Brigade of the 1st Canadian Infantry Division, and proceeded overseas with this formation a month later. He returned to Canada late in 1940 to assume the appointment of General Staff Officer, Grade I, with the 3rd Canadian Infantry Division, and in July, 1941, accompanied this division to England. In the United Kingdom, he commanded the Regina Rifles, and then commanded the 3rd Infantry Brigade in the 1st Division for eight months prior to his appointment as Brigadier, General Staff, First Canadian Army, in April, 1943. His promotion to Major-General and appointment to command the 2nd Canadian Infantry Division dates from January 11, 1944. He led the 2nd Division in the invasion of France. In September, 1944, he took over command of 2nd Canadian Corps, in a temporary capacity,

and fought the battle of Walcheren. In November, 1944, General Foulkes was promoted to Lieutenant-General and left Northwest Europe to take over command of the 1st Canadian Corps in Italy. In February and March of 1945, he took the 1st Canadian Corps to Holland in time to play a leading role in the final battles which brought about the collapse of the German Army. After relinquishing command of the 1st Canadian Corps on July 17, 1945, General Foulkes returned to Canada and was appointed Chief of the General Staff on August 21, a position which he held through the difficult period of demobilization and the reconversion of the Canadian Army to its postwar organization. He was appointed to be the first Chairman, Chiefs of Staff, on 1 February, 1951. He was promoted to the rank of General on January 26, 1954. In 1959, General Foulkes was appointed Colonel of The Royal Canadian Regiment, the regiment which he joined in 1926. For war service he has been granted the following decorations: Companion of the Bath, Commander of the British Empire, Distinguished Service Order, Four mentions in Despatches, and Canadian Forces Decoration. In addition, he received the following foreign awards: *Commandeur de la Légion d'Honneur* and *Croix de Guerre avec Palme*, from France; *Grand Officer of the Order of Orange Nassau*, with *Swords*, from The Netherlands; *Grand Officier de l'Ordre de la Couronne avec Palme and Croix de Guerre 1940 avec Palme*, from Belgium; *Commander of the Legion of Merit*, from the United States of America; *Grand Officer, Military Order of Italy*; and *Grand Cross of the Order of George I*, from Greece. General Foulkes also holds a *Doctorate of Laws from the University of Western Ontario* and a *Doctorate of Science from the Royal Military College of Canada*. General Foulkes is a widower and has a son, who is a metallurgical engineer with the Aluminum Company of Canada. General Foulkes is at present Associate Professor of Strategy at Carleton University.

(Quorum 16)

Hugh R. Stewart,
Clerk of the Committee.

Pursuant to Standing Order 65(4)(b):

¹ Mr. Smith (*Northumberland-Miramichi*) replaced Mr. Ouellet on February 13, 1969.

(Text)

MINUTES OF PROCEEDINGS

THURSDAY, February 13, 1969

(40)

The Standing Committee on External Affairs and National Defence met at 11:05 a.m. this day. The Vice-Chairman, Mr. Ryan, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Brewin, Forrestall, Gibson, Groos, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, MacDonald (*Egmont*), MacLean, MacRae, Marceau, Macquarrie, Nowlan, Penner, Prud'homme, Ryan, Stewart (*Cochrane*), Thompson (*Red Deer*), Winch (25).

Also present: Messrs. Buchanan, Hymmen and Roberts, M.P.'s.

Witness: Professor Michael Brecher, Department of Economics and Political Science, McGill University, Montreal.

The Vice-Chairman introduced the witness, Professor Michael Brecher of McGill University. Members had received copies of an article by Professor Brecher entitled *Neutrality: An Analysis*, from the *International Journal*, Vol. XVII, No. 3, Summer 1962, and Professor Brecher's curriculum vitae.

Professor Brecher made an opening statement and was questioned by members of the Committee.

With the questioning continuing, at 12:55 p.m. the Committee adjourned, until 4:00 p.m. this day.

AFTERNOON SITTING

(41)

The Standing Committee on External Affairs and National Defence met at 4:05 p.m. this day, with the Vice-Chairman, Mr. Ryan, presiding.

Members present: Messrs. Allmand, Anderson, Barrett, Cafik, Gibson, Guay (*St. Boniface*), Howard (*Okanagan Boundary*), Laniel, Legault, Macquarrie, Marceau, Nowlan, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Stewart (*Cochrane*), Winch (18).

Also present: Mr. Hymmen, M.P.

Witness: Professor Michael Brecher.

During the afternoon sitting, Members completed their questioning of Professor Brecher on various aspects of Canadian defence and external affairs policies.

On motion of Mr. Allmand,

Agreed,—That the article entitled *Neutrality: An Analysis* and the curriculum vitae of Professor Brecher, be printed as an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix hh*)

The Vice-Chairman, on behalf of the Committee, thanked Professor Brecher for his testimony.

The Committee adjourned at 5:45 p.m., until Tuesday, February 18, 1969 at 11:00 a.m., when the witness will be Professor Kenneth McNaught.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Thursday, February 13, 1969

The Vice-Chairman: Would the meeting come to order, please. Are there any corrections to our record of Minutes of Proceedings and Evidence? If not, the Committee has before it today, as an invited witness, Professor Michael Brecher. Professor Brecher, who is a distinguished Canadian political scientist, has specialized in and has established an enviable reputation in the study of the politics of the third world, particularly with respect to India. His publications, which are listed in the biography already circulated, attest to his expertise in this field.

One of his main interests has been the study of neutralism and non-alignment policies which are prevalent in some of these countries. He has examined the environment, characteristics and attitudes peculiar to each case. His paper entitled "Neutralism: An Analysis", which appeared in the *International Journal* in 1962, has already been sent to members.

As part of our consideration of the choice which is open to Canada of participating in defensive alliances with other states or of pursuing a policy of neutrality, Professor Brecher has been asked to explain, by referring specifically to Sweden, Switzerland, Austria, India and other states, how neutrality or non-alignment or neutralism meets their defensive needs. We hope he will also describe why formerly neutral states, such as Belgium, are now members of alliances.

• 1110

After he has made his introductory remarks, Committee members will then have an opportunity to question Professor Brecher regarding his views. Professor Brecher.

Professor Michael Brecher (Department of Economic and Political Science, McGill University): Thank you, Mr. Ryan. Gentlemen, I think it might be well if I spent a few moments this morning in clarifying what appears to me to be a very considerable misunderstanding about the terms that are used interchangeably to discuss one of the most

significant phenomenon in contemporary international politics.

I think there are four quite distinct terms which may be viewed along the spectrum from isolation to total involvement which relate to the foreign policy of those states that consider themselves neutral, non-aligned, neutralist and neutralized. I should like, in the course of this very brief semantic exercise and by way of introduction to some other observations, to indicate which states fit which designation, what are the conditions under which their particular brand of this phenomenon of non-alignment has flourished or has failed and the reasons for that, and ultimately, if I may, and even prior to the questions, I would like to address myself to the possible relevance of some form of non-alignment to Canadian foreign policy in the immediate future.

I will now very briefly sketch the meaning of these four terms in the following way. Neutrality refers specifically to a legal status which comes into effect once a war has begun, and it simply refers to the posture of any state which, after war has started, takes the position that it will not be a participant or belligerent in that conflict. So, the United States from 1914 to 1917 and again from 1939 to 1941 would be a typical illustration of a neutral state practicing the legal status and policy of neutrality whereby it claims certain rights and assumes certain obligations towards belligerent states. There have been, however, many states, particularly in the post World War II era, that have indicated in advance they do not wish to participate in any possible overt conflicts that might ensue at any time in the future; that is to say, they have taken a posture of non-alignment, non-identification or non-participation, particularly in the conflicts which have ensued and might ensue in the future as between the U.S. and the U.S.S.R. in their respective blocs. I would suggest that non-alignment of this type is a purely passive foreign policy. Its primary objective, if you wish, is self-protec-

tion by isolation from the contaminating effects or the spill-over effects of interbloc conflict. Of course, we have an outstanding example of this in the case of Sweden. We also have the case of the permanently neutral or neutralized state which declares to everyone that it will not only not involve itself in conflicts which might occur, but that *a priori* it will conduct its foreign policies in such a way that it can never conceivably find itself in a situation where it must align with one or the other.

There are many examples of the permanently neutral state or the neutralized state. Switzerland, of course, is the outstanding one. For the past five centuries it has been, in a sense, the symbol of the permanently neutral or neutralized state which has conducted its foreign policy in such a way that it has never found itself obliged to participate in an external conflict. More recently we have the example of Austria, which was formally neutralized by the U.S. and the Soviet Union in 1955, and Laos by the powers in 1961. Finally, we have the policy, which is a logical extension of non-alignment, a more active area which we call neutralism, that is to say, this is the conscious decision of a state to pursue a foreign policy which specifically aims at reducing the tensions, frictions and conflicts between the great powers in order to prevent any spill-over effect which could escalate into global conflict and draw this neutralist state into the picture. I am suggesting that you can move along a spectrum from neutrality which fits a wartime situation, non-belligerence, through permanent neutrality or neutralization as with Switzerland, Austria and Laos; or non-alignment, of which Sweden is an example; or neutralism of which the outstanding examples, in an earlier period would have been India in the fifties, the U.A.R., and Ghana. This distinction, I think, is vital to an understanding of the differing behavior of states that have not involved themselves directly in the bloc conflict from 1948 onwards.

• 1115

There are, it seems to me, a number of other distinctions that are terribly important here. First of all, we must differentiate, in a time sense, between long-established non-aligned states and those of very recent vintage. Switzerland has five centuries of successful practice of permanent neutrality or

neutralization; Sweden has two centuries; Belgium has almost a century, from 1831 when it was neutralized by the powers, until 1914 when, despite its preference, it found itself a participant in World War I. And here I might begin some analysis of the reasons that affect these different states in different situations, precisely because one of the parties to that war, Germany, found Belgium's geography and topography of particular value in its short-term objective, which was an assault on France. In other words, Belgium by 1914 had acquired a geographic position which did not lend itself to neutrality, but rather was a distinct liability for that state in that particular constellation of international political forces, with the result that the objective conditions had been undermined. I distinguish, then, between the long-established neutrals and the newly emergent non-aligned states of Asia and Africa; Austria and Yugoslavia, consciously so, from 1945.

The third distinction that I would draw here is between types of states engaging in a policy of non-involvement. Within Europe, if you follow the spectrum that I have suggested earlier, you have Switzerland which is permanently withdrawn from conflict situations; you have Austria, which is unable to involve itself, partly because it has been formally neutralized by the super-powers and because its geographic position in the border zone of the two blocs prevents it from playing any autonomous role; and you have Sweden which, for reasons that I shall indicate in a few moments, can indeed play a very active role in such issues as the Korean peace-keeping operation, UNEF in the Middle East, an active role in the Committee of Eight on the discussions on disarmament in Geneva, and a host of other issues of direct relevance, not only to Sweden but to the international political system as a whole. There is Yugoslavia, which begins ideologically and in power terms as a committed member of one bloc, but from 1948 onwards moves increasingly to a position of non-alignment and then neutralism, actively searching for ways of mediating conflict situations whether it be in the Middle East, or between the blocs, or over the issue of nuclear tests in the early sixties, the whole question of nuclear non-proliferation and the like.

• 1120

That European group has to be differentiated from the Asian-African group of neutralists

or non-aligned states, and here we have, of course, the major cluster. It is in the third world that non-alignment has reached its apogee and its legitimacy as a policy to be pursued. The vast majority of the 70-odd states that have become independent since the end of World War II can be classified at the lowest point in this spectrum. That is to say, they are passively non-aligned, and they are non-aligned for reasons which I think flow from the very character of their emergence into independence.

Essentially, non-aligned states in the Afro-Asian world become non-aligned because they respond to three stimuli. They are internally weak. In a political sense, they lack stability. In a national sense, they are multi-tribal and multi-ethnic societies searching desperately to create a nation out of the conjureries of disparate groups. They are weak economically because of the legacy of colonialism, because they have yet to enter the industrial age. That internal weakness is a major stimulus to non-alignment because non-alignment permits them to concentrate on the mobilization of social, political and economic forces and energies to overcome those sources of internal weakness. They are also responsive to the psychology and the reality of the colonial experience. And it is this which makes them, of necessity and understandably, fearful and distrustful of any attempt by any outside great power to penetrate, in such terms as neo-colonialism, which is simply euphemism for renewed penetration of former colonial regions by a variety of economic aid agreements which, in the minds of the decision-making élite of these new states, constitutes the potential basis for the re-establishment of political control.

The third stimulus that these states respond to is the character of global politics from 1948 to 1962 or thereabouts. That is to say, the two-bloc system, the bi-polarity or, if you wish, the tight bi-polarity that characterizes the relations between the Soviet and Western worlds. That bi-polarity provided both the challenge and the opportunity to play a role for weak states which they would otherwise be unable to play. The challenge was the danger of an escalating conflict which could embroil the entire planet and thereby destroy or retard the efforts of these new states to consolidate, to engage in economic development, to produce political stability. And the opportunity was that in a situation involving

two major conflicting forces, a third would-be mediating element has a potential role of, if you wish, flexible involvement, bridge-building, offering good offices, for which of course there was a good deal of evidence in the international politics of the 1950s.

But even within the Afro-Asian non-aligned group, one has to make some fundamental distinctions. There were the passive non-aligned, the small states who had no pretensions to be active in world politics, and the neutralist states, those who did have pretensions and played what I would regard as a vital positive role at a particular period of time within a particular constellation of world politics. The outstanding examples were India, and, to a lesser extent, Ghana and the U.A.R. Even here one further distinction is in order because Indian neutralism, itself, went through a number of stages as it responded to the new challenges and the new opportunities. India began, in 1947, when it became an independent state, as a neutral, and if you go through Mr. Nehru's speeches, as I have in great detail, what you will find in that period is a continuous expression of hope that India could remain free from overt conflict beyond its borders. The Korean War marks the first divide when India suddenly realized that it is not enough to remain isolated, it must now openly declare that it will not stand with either of the blocs in any over-all conflict situation. By 1952-1953, it moves to a stage of neutralism, mainly the conviction that India has both the obligation and the right to participate actively in cushioning that conflict so as to contribute to world peace.

• 1125

There are some significant differences, even amongst these states, and I would sum them up this way, if I may. India was able, because of its size and its geographic position and its population and its economic potential, and the fact that it was regarded by the super-powers as a crucial variable in the emerging balance, the new balance of the 1950s, it was able to exercise influence disproportionate to its real power. I cite, for example, its crucial role in 1952 in breaking the deadlock in the discussions over the prisoner-of-war issue, which ultimately was to lead to a settlement in Korea. I cite, for example, its catalytic role in the peace negotiations that followed the first Indo-China war, in the con-

ference of 1954. I cite, for another example, its role in the interminable but nonetheless important negotiations over disarmament all through the fifties and, of course, its role in the Committee of Eight in Geneva.

The U.A.R., under President Nasser, used the term "positive neutralism", but it had no pretensions of global character. Rather it was concerned with utilizing its pre-eminent position in the Arab world within the Middle East to extract from the two powers the kind of aid, economic and military, which would strengthen its position of hegemony and also strengthen it in its permanent conflict with Israel.

Ghana's Nkrumah, by contrast, had great pretensions but they were of a continental African type. For Ghana, under Nkrumah, non-alignment or neutralism meant simply an opportunity to build the image and the substance of what is essentially a small state to a position of natural leader in the movement towards a united Africa, which could ultimately play the role, he thought, of a third force in world politics.

I use the dates 1948 to 1962 consciously because by 1962 fundamental changes in the global constellation of power rendered that kind of non-alignment less useful and it is not, indeed, by chance that neutralism has become less and less of a formidable force in the post-1962 period. Essentially, if I may sum it up in these terms, when the world moves from a tight bi-polar conflict relationship to what the academics from time to time call a polycentric or broad-based distribution of power with new centres, in a China, in a Western Europe, France and the like, the role for a third grouping to serve through good offices, as a possible mediator of conflict, is automatically reduced. That is the first reason.

The second reason is that India, the leading exponent and practitioner of non-alignment, found itself in 1962 engaged in direct conflict with its neighbour, China, from which it suffered both psychologically and materially, in military and economic terms, with the result that there was an almost traumatic transformation of the attitudes of the Indian leadership from external affairs to domestic affairs, and a growing preoccupation with solving internal economic, social and political problems.

• 1130

One final distinction, if I may, and that is, some states are non-aligned for all issues,

some states are aligned for all issues, but there are many states that may be non-aligned for one or another kind of issue and may be aligned for others. Switzerland is at one extreme. It is non-aligned in the sense that it is permanently neutralized from all external conflict. So is Austria, for different reasons, weakness, and precarious survival as an independent state at the raw nerve point of interbloc conflict. Laos, too, is permanently neutralized and outside of the ambit of this conflict situation. But Sweden, though it has a pro-Western set of values in culture, though it has a system of government much more akin to that of the West than any member of the Soviet bloc, has become increasingly non-aligned, let us say neutralist, in an active sense. It played a role in the Neutral Nations Repatriation Commission as one of the five members in Korea. It took an active role in the Middle East UN Emergency Force and in the discussions on disarmament. And to take two very recent examples, it has not been fearful of declaring its position, officially and unofficially, on two issues in which it found itself, so to speak, aligned with the other bloc.

The Soviet invasion of Czechoslovakia led to very substantial antagonism in the Swedish press in which Swedish ministers were involved. American policy on Viet Nam found Sweden aligned on the other side. In other words it was, if you wish, a swinging non-alignment or an active neutralist's involvement on one side or the other, depending on the issues.

Yugoslavia has been active on a very wide range of issues once it emerged from membership in the Soviet bloc. Brazil and Mexico are two other examples. We do not think of them as non-aligned states because they are members of the OAS and therefore are generally regarded as part of the American sphere of influence within the Western Hemisphere. Yet on the Cuban question, Mexico is the one state in the OAS in the Western Hemisphere that did not break diplomatic relations and that maintains economic as well as other relations with Cuba. Both Brazil and Mexico have played a very active role in the non-aligned Committee of Eight on the disarmament issue. In short what I am suggesting, gentlemen, is that even the image of non-alignment is sometimes blurred by the fact that some

states take the initiative in certain issues where they regard non-alignment as justifiable.

Now briefly on special conditions. Switzerland was able to maintain itself for five centuries as what I call the isolationist non-aligned state for three reasons: particularly its geography—its topography or terrain made it, if you wish, naturally defensible; secondly, as a corollary to that, it was too costly for neighbouring states to invade and attempt to conquer Switzerland relative to whatever benefits might accrue from that conquest; thirdly, in positive terms, Switzerland has for a long time performed the useful function of a state in which representatives of participants can engage either in espionage or negotiations in an area which is not a direct participant in conflict. But clearly the Swiss case is inappropriate for Canada, because the geographic variable does not pertain, the cost factor relative to the benefits to be derived from a conquest of Canada does not pertain and thirdly the role as the sieve for information, so to speak, does not obtain.

Austria is totally passive and what makes that possible is simply the willingness of the super powers to tolerate it. It could be eliminated at any moment at which the buffer function that Austria performs were regarded as no longer valuable. Because it straddles the border zone it is useful. Because the super powers regard the buffer as worthwhile Austria survives in this permanently neutralized sense.

The Belgian case I have already cited. Its permanent neutrality was guaranteed and accepted as long as it suited the powers so to do, and in 1914 when Germany found that Belgium was extremely important as a link to France, then it invaded.

• 1135

The Indian case. Size, geography, the possible effect of India's joining one or another bloc on the balance of power in the world, made it desirable for both the Soviets and the West to court India with economic aid and later military aid, precisely to retain India in a position of independence.

The United Arab Republic in fact is not a non-aligned state. In most issues it is closely aligned with the Soviet bloc by virtue of its dependence on that bloc's military and economic aid from 1955 onwards.

Ghana has ceased to be a non-aligned or neutralist state after the coup of 1966 which brought the military power and expelled Nkrumah.

There remains Sweden, and since I regard Sweden as the one example with possible, and I would suggest high possible relevance to the Canadian case, let me look just for a few minutes at the Swedish case. It is a particularly interesting one—small state in northern Europe which does not have the geographic assets of Switzerland. It does have considerable benefits in terms of its industrial establishments and in terms of its economic and military potential. If it were to move into one or another orbit it would be of great value. Yet Sweden has managed to maintain its posture for almost two centuries. It has paid a price, of course, and that price has been a vast defence establishment. It has also succeeded in doing this by great diplomatic skills and by a cumulatively created image of a useful function performed by remaining outside of world conflicts. It happens to be a near neighbour of the Soviet Union, but it is also a near neighbour of the NATO states; yet it never joined NATO. Its role in the United Nations through peacekeeping, if you wish, through the contributions of a Secretary General, and even now in the Middle East through Ambassador Jarring, has given to Sweden the almost unique position in the contemporary globe of a state non-aligned, with mutual respect, performing a positive function or series of functions contributing to international peace.

Why do I say this has possible relevance for Canada? We will have an opportunity during the question period I hope, to deal with this in detail, but if I may I would like simply to comment on one possible caveat that would be introduced immediately.

If you use the Swedish analogy, does this not suggest that Canada too would have to build a massive defence force, and I am not thereby suggesting that we ought to increase our defence budget rather than to reduce it or to leave it unchanged? I think the answer is rather different. Canada, in a sense, has a geographic asset. I know that this is precisely a reversion of the argument generally given about Canada's position in the world. I suggest that Canada has a geographic asset which Sweden lacks. It is precisely the fact that Canada occupies the northern half of the Western Hemisphere that gives to it a built-in

or inherent or natural protection against any possible incursion from without except from the south, and I do not anticipate this, by which I mean that regardless of what Canada's defence posture is in global terms, the United States is committed by its own interests to the survival of Canada either as an independent state or, in any event, to the prevention of intrusion and ultimately of conquest of Canada from the north or elsewhere. In other words, I would submit, gentlemen, that the defence posture of Canada has always operated on the premise that there must be a substantial defence capability to withstand possible assault, particularly from the north. I would suggest that what we have here is a kind of political or intellectual lag that afflicts a great many decision-makers in this country; that is to say that whereas in the late forties and much of the fifties during a period of rigid bipolarity and direct confrontation between the U.S. and the Soviet Union and their blocs, the danger to Canada as perceived was very real, what has happened by the late 1960s is that that tight bipolarity has given way to much greater flexibility and fragmentation within both blocs and that the danger as it was perceived has been replaced by a relationship between the U.S. and the U.S.S.R. which is at least one of détente and in which the Soviet Union has emerged as essentially a conservative, satisfied state which is perhaps just as concerned with the maintenance of peace as Canada or any other country in the Western world.

• 1140

One might say that Sweden, after all, has benefited from two centuries of this posture. Any possible change of Canada's position now would immediately cause a wrench.

Mr. Chairman, I think I should pause now because this would lead me into a whole series of specific policy proposals about Canadian foreign policy that I may have the opportunity of suggesting in the course of this discussion. But rather than do it in this continuous monologue, I think perhaps we have now established at least a frame of reference in which the question of neutrality to neutralism, theory in practice and applicability to Canada, can perhaps be probed in greater depth.

The Vice-Chairman: Thank you, Professor Brecher.

The first three questioners I have on my list are Messrs. Howard, MacDonald and Allmand. Mr. Howard.

Mr. Howard (Okanagan Boundary): Mr. Chairman, as the speaker went on he answered many of the questions that I had. I was most interested in his comments all the way through as he enlarged very considerably on the paper which he had prepared.

I have one question with regard to comments on page 236 of his paper in which he suggests the channelling of the aggressive instincts of Western nations into development projects in the underdeveloped nations and so on. In the terms in which he discusses it here, if this were carried out to the extent that he suggests I wonder if we would not be in the same position of imperialism, of the charge of imperialism, in this problem of persuading the underdeveloped countries that our aggressive instincts are not directed toward imperialism but rather use a healthy outlet for our own excess energy.

Professor Brecher: Mr. Chairman, I would submit that as one attempts to reconstruct a viable Canadian foreign policy in the next decade, there are two objectives that ought to be uppermost in the minds of Canadians who ponder this question. One which I think is long overdue is the creation of a distinct image in the external world of an autonomous Canadian identity as an actor in the international community. The second is to create the image of a functioning bilingual and multicultural society, successfully groping with its internal problems and capable of utilizing its varied assets for the benefit of that community. I would submit further that the image of Canada despite its posture of the last 20 years as I have experienced it in travel through much of this world, is still one of respect, almost affection, so that Canadian foreign aid is not regarded as the instrument of penetration with the dangers that might follow that are normally associated with the foreign aid made available by the super powers. In a sense Canada has managed to retain the image of a middle power which does not constitute a threat to any state or any region in the world, but rather has not realized the full potential, within the United Nations and outside, of a state which, because of its gifts and talents and characteristics and potentialities, can play a role such as Sweden has, but very few others, which would contribute markedly

to linking the Western and third worlds in a positive way. So that to the question: is there the danger that this would be perceived as simply the expansion of a kind of innate aggressive tendency within Canadian society, I find no evidence whatsoever of that image being prevalent in the world and therefore I do not regard it as an operationally significant constraint on Canada's active non-involvement—that is to say active pursuit of a policy, which I will spell out a little later in answer to some questions, to create that image of a distinctive actor in global policy.

• 1145

Mr. Howard (Okanagan Boundary): Then your argument is not to consider neutrality but a very aggressive outgoing kind of effort in the world, along the lines of Sweden. Do you see this in relation to a strong military role of a different nature than our alignment in NATO and our alignment in NORAD, for instance? Do you see it in relation to an aggressive development of the total geographical area of Canada—the Northland for instance? Is this the picture that you are painting?

Professor Brecher: I would say that the question of NORAD has to be separated from that of NATO, I think, and NATO has to be related to the over-all defence policy and particularly Canada's role in a United Nations defence policy.

On NORAD there is very little one can say now because in a sense the issue has been pre-empted. And here I might say—and I think others share this view—that some people were perplexed and surprised, perhaps even astonished at the ease with which the extension of the NORAD agreement took place without the kind of public debate which is now taking place in this country on the fundamentals of Canadian defence and foreign policy. So in a sense anything that one might say about NORAD now could not have any actual operational relevance for a period of five years. But I would say this: that I myself would think that in any attempt to extend an ABM system to Canada within the framework of NORAD ought to be resisted by this country because I think its contribution would be counter productive. I do not see it as essential to the defence of this country because I do not see the challenge to Canada, as an independent state, in the terms

in which NORAD in 1957 and beyond has stated this danger to be.

Now in NATO I would suggest, just as in so many other aspects of foreign policy, that there is a kind of perpetual lag in the response of decision-makers to change in reality. NATO in 1949 meant one thing and NATO in 1969 means something quite again. One made the case in 1949 that a weakened community of West European states confronted with a much more powerful Soviet Union then in a stage of expansion and conflict with the West needed that kind of umbrella protection that NATO provided. Some rejected the argument even then, but my point is that if that argument were valid in 1949 it is not *ipso facto* valid in 1969. And I find myself astonished at the ease with which people go over this problem without examining the fundamental premises on which any military organization like NATO has built, at a particular period in a particular frame of reference of international politics.

• 1150

As to Canada's role . . .

Mr. Anderson: May I ask a supplementary, Mr. Chairman?

The Vice-Chairman: Yes, in a moment.

Professor Brecher: —I would, if I may, put it bluntly by suggesting that in my judgment Canada really contributes nothing to European defence but spends a great deal in so doing. Let me note that Sweden, which is a European state by geography and culture, is not a member of NATO, yet NATO has flourished without Sweden in so far as it has flourished at all—it has performed whatever functions were assigned to it for better or for worse. But the argument that is often used, the kind of inverted domino theory that a Canadian withdrawal from NATO in 1969 would set in motion a collapse of that organization strikes me again as facile reasoning for it presupposes that the Canadian contribution in substance as well as in image is highly valued—and we are told this very often at the official level. I think it is also true to point out that in recent American statements about the future of NATO the name Canada does not even appear—almost as if the perception of the United States is that Canada is not a member of NATO, or if it is, its role is so infinitesimal that it need

not be placed within the perspective of assessment. So that if the argument is that Canada's withdrawal or presence is a crucial indicator of the survival potential of NATO, I would say that this line of reasoning is shallow and simply is not supported by the evidence that we have.

Now that in itself is not a reason for Canada's withdrawing or staying. I am merely suggesting here that the decision as to what Canada's future posture in Western Europe should be, in my judgment, should be determined by what Canadians would like their foreign policy image to be ten years from now and what steps ought to be taken in order to realize that objective.

Now if, as I argue, the two fundamental objectives are distinctive identity in the world and a viable hopefully successful bilingual and multi-cultural society at work, then the question of NATO has meaning in that context.

The Vice-Chairman: Have you a supplementary, Mr. Anderson?

Mr. Anderson: No, it is a bit lost now, Mr. Chairman.

Mr. Howard (Okanagan Boundary): Can we follow your theories on this with a reduced defence budget, a defence budget that stays the same, or must we increase it?

Professor Brecher: My answer here would be that this would permit a substantial reduction in the defence budget and that both the reduction of the defence budget and an altered status vis-a-vis Western Europe would permit two independent courses of action which I would regard as significant in terms of those two over-all objectives.

First of all, I would submit that Canada can play a role which has not been played by any other state and that is essentially to activate Article 43 of the United Nations Charter, to take the initiative in signing an agreement with the Secretary-General of the United Nations in which a permanent standby mobile military force would be available to the United Nations for peacekeeping operations.

Mr. Laniel: They do not want it.

An hon. Member: They might want it.

Professor Brecher: Well do we have evidence that they do not want it in the sense that we have ever put it in the terms in which I am putting it now—that is to say, an offer to sign an agreement with the Secre-

tary-General which does not involve the Military Staff Committee of the United Nations or the Security Council directly. This can be done as provided in Article 43, in which a member of the United Nations takes the initiative through an agreement with the United Nations acting through its Secretary-General.

• 1155

But I want to go further and suggest that that reduction of defence budget it seems to me can then make possible two other important national objectives—one anyway. It can contribute, it seems to me, to the permanent tension indeed, which we experienced this very week in our federal internal relationships, by assisting in the process of making it possible for poorer provinces to carry out certain programs and also by making a dent in what is the permanent fiscal problem of this country.

I myself as an educator, if you will permit me, would argue that there is also a fundamental crisis in education in this country of which the financial dimension is often lost sight of and this kind of substantial reduction in the defence budget would also contribute to the amelioration of that problem.

The Vice-Chairman: A supplementary, Mr. Thompson, and then Mr. MacLean.

Mr. Thompson (Red Deer): You have already said, sir, that the defence budget of Sweden is, comparatively, a very high budget, that it costs Sweden a lot of money just to maintain its neutrality. If we were to do in Canada what is being done in Sweden it would treble our present defence budget. I fail to see how you can say that a similar position in Canada would reduce our budget. You mentioned having a great land mass. Do you mean then that we just throw off to our neighbour to the south our responsibility for providing ourselves with any defence in order to stand in a neutral position? If what you say is true then it seems to me that we would not save money, we would have to double or triple or quadruple what we are spending today on defence.

Professor Brecher: I think the answer to that is this. When I use the term "a geographic asset" I mean that regardless of what Canada spends for defence its defence is assured—this is the point I am making—and it is assured precisely because of the accident of geography.

Mr. Thompson (Red Deer): Sovereignty is not assured.

Professor Brecher: Yes, I think it is because unless I am totally mistaken the kind of expenditure that Canada indulges in on defence today does not really make any difference whatsoever in its capability either to withstand an assault from the North or from the South. In other words, this is a purely symbolic question for me. Now if you are arguing, and I fail to see that this is valid, that any independent state must have a substantial defence force simply as a symbol of independence, it seems to me that a great many states in the world have tiny defence forces of 3,000 to 5,000 men with the kind of independence in reality and in image that this country has.

Mr. Thompson (Red Deer): Mr. Chairman, I find our guest inconsistent. He uses Sweden as an example of neutrality and then turns around and contradicts the very basis of Sweden's neutral policy as far as Swedish defence forces are concerned. Do I understand that you equate autonomy with neutrality? Is that what you are saying?

Professor Brecher: No, I would say that many of the states of the third world did equate, and understandably so, autonomy with nonalignment because nonalignment gave them the possibility of preventing a reassertion of influence and possibly control by former colonial powers. I am not so equating though most of the nonaligned states that emerged after the Second World War did so.

• 1200

The Swedish example, it seems to me, has relevance in this sense. Sweden is not a member of NATO, it does not have a NORAD, it has managed to maintain its independence and a degree of respect in the third world with a contribution to the tranquilization, if you wish, of global politics, which is the envy of many. Canada as a member of NATO and a member of NORAD, though it has contributed spasmodically to that tranquilization process, has never achieved that image of a distinctive identity, autonomy, with the result that many of the avenues which would normally be open to Sweden are closed to Canada. The one difference is that Sweden has a massive defence establishment. Canada does not. The reason for that is that Sweden does not have a neighbour like Canada has, which

for its own self-interest is committed to the defence of Sweden as the United States is committed to the defence of Canada, regardless of what Canada's defence posture happens to be. This is a built-in unchanging factor of the landscape of America's position in the world.

Mr. Thompson (Red Deer): You are saying that within a position of neutrality for Canada, we must continue to belong to NATO and NORAD.

Professor Brecher: No. I am saying precisely the contrary, that Canada withdrawing from NORAD and NATO would not alter one iota the United States' commitment in defence of Canada.

Mr. Thompson (Red Deer): Can you eat your cake and have it?

Professor Brecher: Yes, that is precisely what I am arguing, but I would not use the metaphor of eating cake and having it. I would say that Canada in adopting this kind of policy could perform a role which it is denied now, which in the last analysis is of interest not only to Canada, not only in global terms to the general problem of tranquility, but even, if you wish, to the United States. Let me cite an example.

For reasons with which we are all familiar, I think, it has been impossible for United States leaders to bring themselves to the question of a formal relationship with China, for the past 19 years. We are in the midst of this debate, in fact the debate is virtually over. There was a time...

Mr. Thompson (Red Deer): Is it over?

Professor Brecher: In this country.

Mr. Thompson (Red Deer): Is it?

Professor Brecher: I think it is. I mean over in the sense that a policy initiative has taken place after spasmodic debate beginning in 1950 in this country, as to whether or not Canada should attempt to establish formal diplomatic relations with Peking. In that sense it is over. The debate will continue as the course of these negotiations proceed, but one fundamental stage of it is over, once a government adopts a policy option, which in this case is to initiate discussions which would lead to negotiations with the aim of establishing diplomatic relations.

There are many people who would argue that what the United States could not do because of the special relationship between the U.S. and China in the 1945-1949 period and even before, Canada could have done and could do now. And indeed there are many people who argue that by so doing it is even contributing to the United States' interests.

Thus, when you raise the question, "How can you alter your posture *vis-à-vis* NATO and NORAD and still expect the United States to perform the kind of function which it has performed in the defence field for 20 years?" The answer is that there are many initiatives that Canada could take in foreign policy which apart from its own national objectives, have wider implications that are beneficial, even to the United States, and that there are Americans, at least some American decision makers, who know this although the constraints of their own policy may make it impossible for them to say so officially.

Mr. Thompson (Red Deer): Mr. Chairman, it is impossible to go on with a supplementary without getting into other areas. Thank you.

The Vice-Chairman: Thank you. Mr. MacLean.

• 1205

Mr. MacLean: My supplementary has been pretty well answered, but you have said that all Canada has to do is withdraw from NATO and then be in the happy position of Sweden. The happy position Sweden happens to be in is that it is spending more for defence than Canada is, and yet you say Canada will make great savings in defence in this way. Do you ascribe this apparent contradiction entirely to the different geographical situations of the two countries?

Professor Brecher: Yes, I would say entirely. That is to say, I see no contradiction whatsoever in this. I am not suggesting that a simple policy act of withdrawal from NATO would automatically create an idyllic image of Canada in the world. I see this simply as one of the series of steps that would constitute an independent foreign policy for this country and that could achieve tangible goals directed towards this image of distinctive identity.

I would suggest that the kind of contribution that Canada could make in terms of a

United Nations role for the management of force in small-scale conflicts, which it has done to some extent, would be enhanced. The kind of Canadian role in the foreign aid field, both its more positive acceptance and more substantial impact, would be made possible.

I would suggest that it would even contribute to some extent to the great internal debate that is taking place in this country, concerning the future of Canada.

Mr. MacLean: I was thinking more on the specific suggestion that great savings could be made with regard to defence costs.

Professor Brecher: My answer is yes. I see this as a key to substantial savings in defence which could then be used for a number of purposes, external in the foreign aid field, the restructuring of the defence capability to perform an essential mobile peacekeeping operation, and finally, in terms of contributing to the solution or alleviation of the fiscal problems of this country.

Mr. MacLean: Sweden is prevented from doing a number of these things simply because of its geographic location.

Professor Brecher: Precisely.

The Vice-Chairman: We now have Messrs. Laniel and Legault. Mr. Laniel.

Mr. Laniel: Mr. Chairman, my supplementary would be on this question of peacekeeping, and I wonder if our witness would agree with the statement first made to our Committee by Mr. Gellner stating that in the future it will become more and more impossible for nations such as Canada, white people, to do some peace-keeping jobs, in Africa especially.

Professor Brecher: My answer would be yes, as long as the image of Canada flowing from its position of unequivocal and unqualified alignment remains.

Mr. Laniel: That is not the point that he made though.

Professor Brecher: I know it is not, but Mr. Gellner and I happen to disagree on this issue.

The Vice-Chairman: Mr. Legault.

Mr. Legault: My question is supplementary to Mr. MacLean's. In the statement you have given you emphasized the interest of the two major powers in keeping India neutralized in order to maintain a delicate balance. Numer-

ous arguments have been put forth that Canada, by participating in NATO and by being actively interested and present in Europe, has served as a deterrent and helps to maintain that delicate balance, and if withdrawn would create difficulties in the sense that it would unbalance this delicate balance.

You have mentioned the position of Belgium, and that it tried to maintain neutrality, but due to conditions at that time, it was not respected. It has always been the view that Canada's position would be somewhat the same geographically in the present concept of any world conflict.

Would you not believe first that by pulling out of NATO, Canada would break this delicate balance, and secondly that our position, in view of Belgium's experience, cannot be entirely neutral?

• 1210

Professor Brecher: It seems to me that you have raised two distinct questions here. One is the role that NATO may or may not play as a deterrent in Europe. The other is the importance of Canada's membership in NATO in the performance by NATO of that role. I will not address myself to the first question. It is a very long and involved one. I would only say this, that whatever role NATO performs in Europe, the Canadian contribution to that role is of such marginal consequence that it is disfunctional in terms of Canada's identity. Its absence, in my judgment, would barely cause a ripple in that deterrent role that NATO performs. Therefore, I have always regarded this role, from 1949 on, as simply the automatic reflex of Canada being part of a North Atlantic triangle and therefore contributing within that North Atlantic triangle to the defence of Western Europe.

I am suggesting that in the late 1960s and early 1970s, whatever role NATO may play, Canada's presence in it is of no consequence to the achievement of a NATO role. I am suggesting precisely that the Canadian objective, in my judgment, is not to contribute virtually nothing to an organization which can play that role anyway, but rather to contribute something in an altered global environment where the great challenge of the 1970s is going to be the ability of the white Western world to build some kind of dialogue with the third world.

It is precisely the Swedens and the Canadas potentially that can do this. This does not suggest that it would be automatically received, and that it can make the kind of impact which would overcome the passionate racial conflicts that exist. It does suggest only that there is a role for Canada to play which its own people has denied it.

The Belgium case, I think, is not relevant to Canada for the following reason. Belgium was over-run at a time when land warfare was the principal component of military conflicts, 1914. Unless you anticipate a potential enemy of Canada crossing the northern wastes by land in order to attack the populated area of this country on the 100-mile belt north of the United States border, I do not see the analogy at all. The relevant point is Canadian air space. And that presupposes that the kind of conflict that was considered likely or at least possible in the 1950s between the Soviet Union and the United States, in which Canadian air space would be used, is as relevant now as it was in the early fifties.

I suggest, gentlemen, that just as generals very often, in fact usually, fight their current wars by strategies of past wars, we are postulating foreign policy for Canada in the future based upon its relevance 20 years before. And it is the need to rethink the fundamental postulates of Canadian foreign policy interests that leads me to the kind of observation that I have made.

The Vice-Chairman: Mr. Brewin.

Mr. Brewin: I understood you, Professor Brecher, to suggest that there would be some advantages to Canada from adopting a non-aligned position on the same style as the Swedish position, partly because we would not have to undertake a great deal of additional military expenditure because we are in a sense under the American umbrella. What I am not clear about is what would prevent us from reducing our commitments within both NORAD and NATO without terminating either of those alliances.

We are quite clear that within NATO the role that Canada can play can be changed by negotiation. Within NORAD we are told we are not committed to any specific type of air defence scheme, but merely to joint consultations, joint operations. I would like you to specify what advantage in these circumstances you see, particularly through the

withdrawal from an alliance which leaves us quite a lot of freedom about the military role we would play, and at the same time gives us some voice, or possible influence, within the policy of these alliances. I have not grasped what great advantage we would have of getting into the Swedish position.

If I may just add one more point that comes in with it. I do not know any reason why we should not stay within our alliances and still adopt a strong line such as Sweden has done in various matters affecting the third world and the security of the world. I have not really found the case about making ourselves similar to Sweden very convincing so far.

Professor Brecher: Let me, if I may, Mr. Brewin, take your second point first. I think in a sense the answer can be summed up in the word "credibility". I simply mean by this that as long as Canada remains formally aligned with a particular bloc military structure its credibility in the third world is undermined. Let me give you an illustration of this. In 1956 at the time of UNEF—in which, after all, Canada played a role of profound initiative and creativity—if one explores the intricacies of the formation of UNEF one will find that it was only with the greatest difficulty that Canada was accepted as a participant in UNEF, despite the fact that Canada proposed it at the United Nations, and there was a period of 72 hours in which—Sweden had no difficulty in this because of the image of Sweden as the non-aligned state—the government of the UAR indicated that it would not accept Canada.

Mr. Brewin: I thought that was because we were sending the Queen's Own and they thought it was kind of a neo-colonial...

Professor Brecher: That only exacerbated the issue. The real reason was that Canada was identified as a NATO state. So, my answer to your question is that the credibility of Canada is a function of the degree to which it is formally aligned or non-aligned with a military bloc. That is point number one.

To return to your first question, which was can we not simply reduce defence expenditure and yet remain within NATO—I will not talk about NORAD now—I would say of course we could, but it seems to me that would serve very little purpose because if one

is talking about a Canadian role in the world, the retention of status within NATO denies that role. What then is to be performed? The possible marginal influence of Canadian ministers at NATO Council meetings or, if you wish, the marginal influence in the strategy for the defence of Western Europe? I regard that, on the balance of a Canadian role in global terms, as inconsequential. Therefore I would say while it is theoretically possible and indeed practical to reduce our defence commitment and remain within NATO, it would not perform what I regard as the crucial objective of charting a path in foreign policy where the benefits are infinitely greater than the cost of this disruption that would ensue.

The Vice-Chairman: Mr. Nowlan, on a supplementary.

Mr. Nowlan: Yes, but from that answer I almost have another question, but I will ask my first question. Do I understand from your interesting discussion this morning that Canada should in fact have no armed forces other than the armed force that should be committed under Article 43 of the United Nations treaty?

• 1220

Professor Brecher: No, I am not taking that extremist position, nor do I think it is necessary. All I am saying is that the preoccupation in this country with the defence question seems to me to be again a kind of lag because no matter whether we spend \$1.6 billion or \$.4 billion, or even \$5 billion, I do not regard that kind of expenditure as contributing markedly to the defence of this country. Therefore my answer to your question is that I can see a place for a minimal—and, frankly, I am not in a position to indicate a numerical figure—defence budget and defence capability but essentially within the terms of internal order, not in terms of external defence, apart from that U.N. role.

Mr. Nowlan: Yes, because if you rely on the United States, then to be consistent and logical—and you have been pretty logical in some of your discussion—I felt that perhaps you would say that no forces were necessary other than this mobile force for the United Nations.

Professor Brecher: And that which is necessary primarily for internal order.

Mr. Nowlan: I see. You talk about our defensive barrier in the North and no invasion from the South—it is highly improbable—and I would agree with both points, but so far you have failed to mention the sea on either side, and certainly if you change the direction of our forces in NATO-NORAD and rely upon the American umbrella, are you inferring that the seas should also be protected by the Americans and that we do not need any forces there on either side? In other words, the sovereignty of the sea—what little we have of it today—is one of our basic NATO roles, as you know.

Professor Brecher: I will draw an historical analogy, if I may, which is the role of the British fleet in the nineteenth century in essentially providing moats or a defence perimeter for the United States from, I would say, the early part of the nineteenth century until World War I. I think in a sense that function has now passed to the United States or, if you wish, to the combined NATO naval force. However, in answer to your specific question, I can again see a marginal role which would involve a minimal defence expenditure for what is essentially, if you wish, a coast guard function, but not a major naval involvement.

Mr. Nowlan: I see. One final supplementary which arises from Mr. Brewin's questioning. You mentioned the question of credibility and the basic point that bothers me in your thesis is how credible can Canada ever be—which gets to the basis of your premise of Sweden and Canada—when Canada is right next to the United States and when none of the ingredients, the geography, the history and the trade that we have with the United States, involves the Swedish situation?

Professor Brecher: I would answer by saying that the kind of posture that this would entail would be something that might be called "pro-Western non-alignment". I mean by that that the third world, and indeed any other state in this world, is aware of the fact that of necessity Canada's geographic position, its natural lines of communication and its economic relationships create a relationship with the West in a symbolic sense and with the United States in particular which cannot be sundered, nor is it desirable to do so. Nonetheless, it is possible within those parameters, if you wish, to adopt a set of specific foreign policy postures which permit

the creation of this image of non-alignment—i.e., a distinctive identity—though pro-Western by virtue of cultural and other factors.

Mr. Nowlan: But it very much affects your autonomous actor, which is one of the desires...

Professor Brecher: It affects it in degree but again, it seems to me, the spectrum is necessary here. At the moment total alignment has reduced that credibility to X. If you are trying to suggest this in extreme either/or terms I would agree with you wholeheartedly. No matter what Canada would do, the fact that it is white limits its credibility in the third world. All I am suggesting is a way in which that credibility can be enhanced from X to X plus 10, though it may never reach X plus 50.

• 1225

Mr. Nowlan: I wonder, Mr. Chairman, if Professor Brecher is aware of Professor Eayrs' evidence before the Committee. He suggested that Sweden was not the parallel to Canada; Mexico was the parallel. Would you like to comment on that briefly, if you are aware of the evidence he gave here.

Professor Brecher: I am afraid I have not had an opportunity to read Professor Eayrs' text.

Mr. Nowlan: I must say I find yours a little more logical.

The Vice-Chairman: Mr. Anderson on a supplementary.

Mr. Anderson: Like some other speakers, Mr. Chairman, my supplementaries come after other supplementaries, but I would like to follow up the point raised by Mr. Brewin and which was further followed up by Mr. Nowlan. I cannot understand, sir, how Canada's credibility in a third world is going to be increased by following the course of action that you suggest, which is to turn over our defence to another nation, namely, the United States of America. I cannot see that any nation in the third world will look to Canada and say that Canada—and not only with those relationships that you mentioned a moment ago, the trade, the economic and the social relationships, but plus all defence being undertaken by another nation—is somehow a better nation to build a bridge. I would say the reverse would be true. That is more a

statement of opinion than a question. Perhaps you would comment on it.

Professor Brecher: I will comment very briefly. I think the error in this comment is the assumption that Canada's defence is not now undertaken by the United States and, secondly, the assumption that in the third world Canada is now regarded as providing its own defence. The image of Canada in the third world now, in so far as it exists at all, varies, I would say, again along the spectrum from a satellite of the United States to a semi-satellite, to one which in any event, in defence terms, is an extension of the United States, so that again whatever changes we would make by reduction of the defence budget would not alter that image at all.

Mr. Anderson: I think you are wrong in that area, sir. In my view those in the third world who saw Canada making efforts to at least preserve some sort of alliances with other nations in Europe, in some way trying to have a counterbalance to this enormous American pressure from the South, might possibly look upon Canada as trying to assert a national identity, which they would not see if we turned over our defence entirely, as you suggest, to the Americans. You may be quite right in your assumption that we are really defended by the Americans now and it does not make much difference if we stand up and admit it and let them take over the northern islands and run things as they wish up there, but I think that our credibility in the third world would be definitely reduced. I just cannot see that that would improve it.

I have another question along this line. You suggest that we acknowledge the facts of life and let the Americans run our defence, but I cannot think of any nation which has allowed another nation to make free use of its airspace and territory for defence purposes and yet preserved its independence. This is an unfair parallel but the most recent example of this is, of course, Czechoslovakia and the Soviet Union. They did not resist and they allowed the Russians to occupy their area, which I think is a pretty clear indication they are not an independent nation. I think we would be considered by others abroad to be in much the same position as Czechoslovakia now vis-à-vis Russia if we allowed the Americans to come in and take over our defence entirely, even though this may be symbolic, even though we are only trying to

do something which is almost impossible, nevertheless we are trying now and I think this does aid our credibility and aid our image abroad.

Professor Brecher: I think you have misread my comments. I may be mistaken but I do not recall having said at any point this morning that we ought to provide unrestricted access through Canadian airspace to the United States or, indeed, to the occupation of a single inch of Canadian soil by the United States. I do not think I said that anywhere, and certainly I did not intend this.

Mr. Anderson: I am sorry. I took the umbrella defence of the Americans to mean—

Professor Brecher: No. There are two relevant points here. At this particular juncture of the glove I do not see a threat to Canadian territorial integrity and political independence in international politics from the North or the South, because if one perceives such a threat one posits that the Soviet Union is prepared to undertake an action in our northern wastes that could lead to global confrontation. If it did not act in 1967, having poured in almost \$3 billion worth of aid to the UAR and if it has not intervened in Viet Nam, or indeed anywhere outside of the Soviet bloc proper, I would argue that there is absolutely no evidence to support the proposition that there is that imminent—or even not so imminent—threat from the North. Therefore the question of a defence posture seems to me to be highly overworked. We are preoccupied with defence when we should be preoccupied with foreign policy. That is my main point. When I talk about the United States being committed to our defence, I do not mean we ought to open up the doors to the presence of an American army in Canada. It is not necessary. I simply mean by that that if there ever should be a threat to Canada the United States, in its own interest, will have to act at that time. Therefore, I do not see an iota of difference in the defensibility of Canada whether we spend \$200 million or \$2 billion.

• 1230

Mr. Anderson: I do not think these fine distinctions will be understood by nations abroad. They will simply see that we are no longer attempting to take on defence in the north, on the assumption that the American umbrella will cover us.

You may be quite right, it may not involve the use of northern islands, or Canadian waters in the north, or American submarines, or anything like that, but I just do not think these fine distinctions will cut much ice in the third world in which I happen to have spent four of the last five and a half years. It will certainly not improve our image there.

Relative to NATO, sir, I am extremely curious about you constantly saying that we are still referring to NATO in terms of the threat to Europe of the late forties. In my opinion, Canadians have long since developed more sophisticated arguments with respect to NATO, generally along the line that NATO provides us a forum whereby, in conjunction with European powers with basically the same problems, we can put the screws to the United States. We could not do it alone; we can do it in concert. This, I would say, is the argument of the late middle-sixties. Whether it is valid or not, I do not know, but in my opinion you are definitely in error in assuming that Canadians generally simply accept NATO and the NATO commitment of manpower simply because it was a good thing back in the late forties.

Mr. Brecher: No; I accept that comment. I would simply add that I am not persuaded that the leverage idea is a valid one; that is to say, that Canada does in fact, through its NATO connection, put that kind of pressure on the United States; and I would add that even if it were valid the cost of achieving this leverage goal, in terms again of a return to this independent role for Canada, is highly disproportionate.

Mr. Anderson: I agree is a point we could discuss, but I am glad that there are aspects other rather than the defence of Europe that can be put forward.

The Vice-Chairman: Mr. Howard?

Mr. Allmand: I wish to raise a point of order.

The Vice-Chairman: Mr. Allmand, on a point of order.

Mr. Allmand: We have spent more than half an hour on supplementary questions which have ranged over the whole area of the subject matter. What was the purpose of the original list? It is up to you, as Chairman, to decide how the questions will be asked, but I was second or third on the list...

The Vice-Chairman: You are third on my list.

Mr. Allmand: It seems to me that the supplementary question list has become the main question list.

The Vice-Chairman: Mr. Allmand, this is a problem we have with a committee of 30 members.

Mr. Allmand: I have a supplementary question, then.

The Vice-Chairman: We started out with the ruling that there would be no supplementary questions, as you will recall, and that prevailed throughout most of the Biafra-Nigeria discussions. Then our Steering Committee, after some discussion, apparently laid down the regulation that supplementary questions be permitted. That is the instruction under which I am operating at the present time, and members can see that it presents a very difficult problem.

Mr. Thompson (Red Deer): A supplementary question should relate to the original question. I stopped questioning because we were digressing. I think this is where we are amiss.

The Vice-Chairman: The problem is made difficult because, as witness Mr. Nowlan's questioning, it is very easy to continue on from one line of questioning to another.

I think there should be some direction from the Steering Committee because of the particular difficulty we have in this Committee. I think it is largely due to its size. Probably there should be a ruling that no more than three supplementaries be permitted from members relative to a particular question. And that the questioner be limited to not more than two questions.

That will have to be discussed in the Steering Committee and your Chairman will have to take direction from there, and from this Committee on its feeling on the matter.

• 1235

Mr. MacLean: On a point of order, Mr. Chairman, may I suggest that we voluntarily restrict ourselves on supplementaries, or perhaps have none and revert to the original list at least for a while?

The Vice-Chairman: Yes. Is that agreed?

Some hon. Members: Agreed.

The Vice-Chairman: We will go back to Mr. Howard.

Mr. Guay (St. Boniface): I do not wish to create a problem, Mr. Chairman, but it seems to me that the time at our disposal is relatively short for a Committee of this size, as you have mentioned. Many members are interested in asking questions, and no doubt, some of them are answered on supplementaries before you get to the particular questions, but the fact remains that the witnesses who come before the Committee are very important and many of us—I say this in broad terms—sometimes do not get a chance to put the questions we wish to ask. I think the problem affects everyone.

We started this morning at 11 o'clock, we know that we have to sit in the House at 2 and we have to have lunch in the meantime. I think the timing of the meetings is a little off.

The Vice-Chairman: Thank you, Mr. Guay. We did have the problem this morning that the Public Accounts meeting was ahead of us in this room and accommodation is short because of the conference which was just finished.

Can we now go back to Mr. Howard?

Mr. Howard (Okanagan Boundary): Mr. Chairman, in view of what happened when I asked a question half an hour ago I will not ask any more. I yield the floor.

The Vice-Chairman: Thank you, Mr. Howard. Mr. MacDonald has left. Mr. Allmand?

Mr. Allmand: Professor Brecher, yesterday we had General Foulkes as a witness and he made the interesting statement that there was less likelihood of rape with 15 in the bed.

Any question relates to what Mr. Anderson was asking. Would our credibility and our independence be greater if we were completely out of NATO, with no, or very little, military force and relying on the United States to defend us, than by our being in NATO with 15 other nations, where the United States is one among 15 and where the decisions on NATO military matters in relation to the defence of the North Atlantic and so forth are discussed with many nations?

I have the impression that our independence can be just as credible within NATO, that we can serve the role of mediator and that we can initiate the things you say under the United Nations Charter or even more so, perhaps, as Mr. Anderson has suggested—than if we were simply in the position that

you suggest, with the United States protecting us and without our having any say whatsoever.

I can cite certain examples. France, for example, played a role in bringing together the combatants in the Viet Nam war. The fact that France was a member of NATO, although it has changed its military commitment, still served a very useful purpose.

There are other countries in NATO who play different roles internationally despite the fact that they are in NATO, because the rest of the world knows that their NATO alliance—their position in NATO—does not really subject them to all that much control.

I do not know where General Foulkes got the statement, but it expresses the point. In a one-to-one position with the United States we would probably be less credible—and probably our sovereignty and independence would be less—than if we are in a situation where there are 15 and the United States is just one.

Professor Brecher: It seems to me that you have raised a number of questions within this one overall discussion.

• 1240

Credibility has different meanings and different objects of concern. You may talk about credibility vis-à-vis Washington, credibility vis-à-vis the NATO members and credibility vis-à-vis the third world, or the Soviet bloc. I do not think you can lump all these together. Sweden is not a member of NATO and I submit that its credibility within the NATO community would be no less—and would not be increased—if Sweden tomorrow were to join NATO.

In the same way, if at the end of the normal course of the 20-year treaty, Canada were to decide—all this is past now, but it could next year—that it no longer regarded this formal association to be in the national interests of Canada—that these could be served in other ways—this would not alter certain fundamental links that exist between Canada and the United States and Canada and Western Europe.

The whole substance of my argument is that the question of NATO has to be perceived in terms of the over-all objectives of Canadian foreign policy. If that foreign policy is to be narrowed to Canada's role vis-à-vis Western Europe then your point is well taken—I do not dispute it—but I would argue

that this is not the sum of substance of Canadian foreign policy horizons.

We do not live in a world which is narrowly divided between Western Europe and the rest. The kinds of challenges that are going to take place in the seventies make the preoccupation with Western Europe simply out of date and out of tune with what are the great issues of conflict and confrontation between the northern half of the world and the southern half of the world, between the developed and the underdeveloped and between the white and the non-white.

The kind of role that Canada can play in that crossfire of conflicts would be immensely enhanced by the reduction of this narrow-gauge orientation and would be reduced virtually to nil were we to continue to tread the same path that we have trod in the last 20 years.

If, however, you wish to see Canada's role in the world as distinctly a western culture—a Western Europe-North Atlantic area of operations—then your point is well taken.

Mr. Allmand: Yes but I cited the example of France.

Professor Brecher: That is not a good example, I must confess, because Canada is not France. Canada does not have the power of France.

Though France may have retained membership in NATO I think you would agree with me that, under General de Gaulle France, if nothing else, has adopted an independent foreign policy.

Mr. Allmand: I do not know if it was General Foulkes, but some witness said recently that that was not so; that General de Gaulle's exterior policy is quite different in what actually takes place that France is still very, very much part of NATO, and that General de Gaulle's policy is really a façade of being apart from NATO but that he is able to accomplish some very independent actions.

Let us examine two things that Canada does notice the fact that it is in NATO—our initiatives relative to China and our policy on Cuba, of which the United States does not fully approve. It is a different policy...

An hon. Member: And Viet Nam.

Mr. Allmand: Partly with Vietnam, too. We are doing things that are not 100 per cent in line with United States' foreign policy, and the

world recognizes that—I think the world recognizes it.

Professor Brecher: It depends which world we are talking about. Some do and some do not. To go back to the example of France for a moment, I must confess that I would differ profoundly with the interpretation which argues that everything that President de Gaulle has done in the world of foreign policy has been a façade for what is essentially the retention of a NATO outlook. It is true that in issues narrowly affecting Western Europe there remain links between France and the NATO military command, but in every other area of foreign policy France has charted its own path—and I think most would agree—to the benefit of France; that is to say, in narrow national interest terms—in enhancing its prestige and its position in world politics.

On examples you cite of China and Cuba I would comment only briefly that there has been talk of a Canadian relationship with China going back to the spring of 1950. It was interrupted by the Korean war. From 1953 onwards it has been 16 years, with the very occasional trial balloon—which remained only a trial balloon—and with quite clear evidence of pressure emanating from NATO allies and particularly, in this case, from the United States, on the question of China.

• 1245

Does the fact that we are in the midst of a process leading towards relations with China mean that Canada could retain this association and to some extent pursue its own independent policies? My answer would be yes, I agree with you. I think this is a matter of degree, but I would regard the difference in degree one of kind—that qualitatively in the examples you cite, compared to what is possible in another road of foreign policy, the difference is so great as to make these examples not irrelevant but not central to the over-all argument.

Mr. Allmand: I just have a final supplementary. Do your definition of neutrality and neutralism and non-alignment really have as much meaning today in view of the technology of today—the atomic bomb, the intercontinental ballistic missile, radar systems and the use of submarines? To take Switzerland as an example, how really free from the ravages of war is it in a situation where we are tossing ballistic missiles, let us say, on Munich or on

Milan or on Lyons? Switzerland stands a great chance of being destroyed. In past years when wars were limited to conventional weapons it could free itself from the ravages of conflict, but now I think perhaps the Swiss themselves might feel they must reconsider this. It would seem to me that these concepts are becoming passé with this new technology—technology is developing even faster.

Professor Brecher: I would agree with your basic point that the revolution in military technology over the past 20 years has meant that even those states that have traditionally been capable of maintaining themselves aloof from the ravages of conflict might well find themselves, through a spill-over effect, either destroyed or very badly damaged. However, while that is true, it is also true that this would apply in only one contingency of war, that is to say, unrestricted air and nuclear warfare of a global or continental type.

We know very well that we have a scale of war from the minor brush fire war that occurs for a day or two through regional, subcontinental and ultimately to what we call a global nuclear war. Therefore, it is only in that one contingency that the impact of technology, as you described it, would be felt by any state that happens to be, whether it likes it or not, close by the major centres of conflict.

Second, I would argue that your point is valid regardless of what Switzerland's or Canada's defence budget happens to be. The defence budget is irrelevant in that case; ultimately there is no defence against that kind of situation, so whether Canada should maintain a large, medium or small budget is not affected by this one contingency type war.

Finally I would add that I think any policymaker, while he has to take into account the possibility in theoretical terms of this kind of intercontinental nuclear war, it is only one of a number of possibilities and he has to operate on the assumption that it is the most remote one, because if he is wrong, no matter what his defence capability happens to be, it is irrelevant to the outcome.

Mr. Allmand: Thank you.

The Vice-Chairman: Gentlemen, we have less than 15 minutes until 1 o'clock and I have six questioners: Messrs. MacLean, Laniel, Thompson, Stewart, Macquarrie and Hymmen in that order. Professor Brecher,

would you be available this afternoon at about 3.30 or 4 o'clock if we could arrange for another meeting?

Professor Brecher: I am told by my hosts for the afternoon that perhaps at 4 o'clock this would be possible.

The Vice-Chairman: Perhaps at 4 o'clock? We will try to arrange a further meeting this afternoon. Apparently there is great interest in your presentation, Professor. We will try to arrange a meeting for 4.00 p.m. We will have word back on that shortly.

I will now call on Mr. MacLean as the next questioner.

Mr. MacLean: I have a lot of questions but I will delete most of them. The ones I will ask will be for clarification of what has already been said. Would you agree that one should not confuse unilateral disarmament with any of these positions of neutrality or neutralism or non-alignment; that countries that follow this policy in many cases spend a great deal on defence?

Professor Brecher: Absolutely correct.

Mr. MacLean: Second, these postures of neutralism and non-alignment are not options that are automatically open to all countries by any means. It depends on the strategic and geographical location and the topography of the country, and so on. In other words, it has worked for Switzerland up to now but it has not worked for Belgium, for example.

Professor Brecher: I would agree that it is not automatically available to all states at all times.

Mr. MacLean: You made the remark in passing that the underdeveloped countries that have gained their independence in recent years are underdeveloped as a legacy of colonialism. Do you really believe that?

Professor Brecher: Yes, I do.

Mr. MacLean: You do? In other words, you are saying that if there had been no contact between Africa, for example, and Europe over the last couple of centuries, Africa would be more developed in relation to Europe than it is today. I think it is a too sweeping statement.

• 1250

Professor Brecher: It may be a too sweeping statement. I am saying simply that the

period of colonial rule of some two centuries or more was accompanied to some extent by the transmission of technology and development, but it was also characterized by a conscious limit on the flow of technology and the possibility of economic development in the interests of the colonial power.

Mr. MacLean: This may be true, and what you state may be true in some cases, but I would say that if it were true in all cases, let us say up until 1500, for example, Africa would have been just as advanced as Europe because it was not colonized by Europe. It would be free to go its own way and create its own development.

Professor Brecher: There are some research scholars who claim that certain societies in Western Africa in the late Middle Ages were perhaps just as advanced as, if not more advanced than, Central Europe.

Mr. MacLean: I have one other brief question. Would you consider that it might be possible, that it is natural, for countries as for individuals to strive for what they consider advancement or pre-eminence, and that over the last few years the détente between the East and the West has come about partially by the fact that national striving has been diverted in both cases away from military objectives to space research and other things of the sort that put a great demand on the national effort?

Professor Brecher: Yes, and I would add to that one of the conditions that made possible this détente was precisely the availability of a third non-aligned world which facilitated peaceful competition in terms of economic and other non-military forms of co-operation, whereby they could expand influence without engaging in direct conflict and confrontation themselves.

Mr. MacLean: Would you agree that further development along those lines should be a prime objective, making reduction in armaments and tension and...

Professor Brecher: That degree of co-operation which you speak of, I think, is a distinct possibility in the coming decade or two.

Mr. MacLean: I will leave it at that. I have a number of other questions. I do not agree with the witness on a number of points but I congratulate him on his presentation. I think if I can say so without being offensive, perhaps he has missed his calling, he should

have been a defence lawyer. He has made a first-class job of presenting a very poor case.

The Vice-Chairman: Mr. MacLean, would you like an opportunity at the end of the list this afternoon?

Mr. MacLean: No, I have finished.

The Vice-Chairman: All right, Mr. Laniel?

Mr. Laniel: I wonder, Mr. Chairman, with all the members gone for lunch, whether we could not adjourn until 4 o'clock.

The Vice-Chairman: Is that agreed?

Mr. Legault: Concerning the others, they have had their questions answered. If Mr. Laniel is the only one who has a question perhaps we could proceed now.

The Vice-Chairman: The others have gone; that is the trouble, Mr. Legault. Mr. Thompson has left, Mr. Stewart has left, Mr. Macquarrie is still here but Mr. Hymmen has left. These gentlemen anticipate that they will have an opportunity at 4 o'clock this afternoon, I believe. They had this in mind when they left.

Mr. Legault: Oh, I see.

The Vice-Chairman: I wonder, Mr. Laniel, if you might continue with a few questions until such time as we have word on the room for this afternoon's meeting?

Mr. Macquarrie: If I may say so, Mr. Chairman, it makes it very difficult for those of us who have to go not to show apparent discourtesy to our colleague. I have stayed longer than I should have. I wonder whether we would not be wise to call it 1 o'clock so that we can hear Mr. Laniel at 4 o'clock?

The Vice-Chairman: Is that agreed?

Some hon. Members: Agreed.

The Vice-Chairman: That suggestion is agreed to. We will adjourn until 4 o'clock if we can obtain a room.

AFTERNOON SITTING

Thursday, February 13, 1969

• 1607

The Vice-Chairman: Gentlemen, may we resume. Mr. Thompson and Mr. Stewart do not appear to be with us yet. Possibly we could start with Mr. Macquarrie.

Mr. Macquarrie: Mr. Chairman, I was interested in Professor Brecher's comment about our lack of image, and I think at one time he said we were not regarded as a distinctive identity and another time I think he used an even better expression, a distinctive actor in the world. I thought we had passed this hangup about our country's identity, and while I respect his views tremendously and am neither a Pollyanna nor an apostle of complacency, I am in profound disagreement with his rather dismal view. I have never felt at such international gatherings as I have been able to attend or from noting the international roles that Canada has undertaken, whether it be in reference to disarmament—and I think particularly the 18-nation group—truce supervision or external aid, that there were failures there which were attributable to this lack of separate identity. Whatever boo-boos we have made in external aid—and apparently we have made a good many—I cannot believe that that is one.

• 1610

Another little observation I would like to make is that I am puzzled by the suggestion that our remaining in NATO and our role and performance—and I believe even our posture there—is of such little consequence, and you graphically made that point. I am puzzled as to how the act of withdrawing from such an inconsequential role would be so extremely important and have such profound effects. I could ask directly if you really think that we have had trouble in communicating with members of the non-aligned states because we have not been able to establish the image of the chaste neutral, or if our acceptance on the international scene—and especially with these countries—is all that less than, shall we say, Sweden, even though it is known that we are an ally of the United States. I would like an evaluation of the difference in effectiveness of our role if we should suddenly present the world with a neutral non-NATO status.

Professor Brecher: May I say first, Mr. Chairman, that I yield to Mr. Macquarrie's perceptive remarks, on the basis of his experience at international conferences, about the image of Canada held by political and other leaders of the states. My observation is based on a combination of personal experience at other levels and also from considerable reading over a period of 15 years how

people in the third world look upon Canada. Whether or not it is correct to state, as I do, that this image is not so much a tarred image as a non-existent one, or whether Mr. Macquarrie is correct or not in saying that there is a distinctive identity, I still submit that there is a pronounced perception of Canada as a kind of natural geographic and cultural extension of its southern neighbour. Canada is America "writ large", if you wish. It is true that in some ways Canadian foreign aid is more acceptable and more effective, though of a much smaller dimension, precisely because it is known that relatively speaking Canada is a small power that does not constitute in any sense a threat to the existence of any one of these states as an independent entity, and in a sense—to the extent that an image of Canada exists—it is positive rather than negative. I accept this.

However, to go to your more basic point, I can only reiterate an observation which was made this morning. It seems to me that Sweden by its posture of conscious and, if you wish, committed non-alignment—despite its refusal to sacrifice its basic values, its culture, its democratic political system, its pattern of life which has grown out of its own historic experience and regardless of the pressures that may be placed upon it—has managed through its posture of non-alignment to exert far greater influence of a positive character in links with the third world in her role through the United Nations in peace-keeping enterprises, and I am suggesting that Canada by virtue of its presence in NATO, whether or not it exerts any influence therein, is automatically blurred in the minds of many who look upon NATO as simply one of two bloc military organizations engaged in a long-term conflict, if you wish, for the soul of Europe.

The only answer I can give you, Mr. Macquarrie, is that the classic defence of the continued Canadian membership in NATO is predicated on what I would call the series of essentially outmoded assumptions about the role of NATO, the importance of Canada's participation therein, the kinds of problems that will confront Canadian foreign policy in the next decade or more, and they are focussed upon the role of Canada simply as part of a North Atlantic triangle or a West European-North American geographic region. That may be important but it is not the total frame of reference in which a country like

Canada must operate. I would go further and say that with the increasing stabilization of the East-West conflict in Europe, the challenge to Canada's foreign policy does not lie in Europe but rather in what is emerging as the traumatic conflict of a continental racial level of development character between the West-North, if you wish, and the South and East with all of the racial overtones and the internal instability that characterize these societies and which highly exaggerate perceptions of mistrust. So that you may well be correct in saying that Canada has managed to maintain a distinctive image. Though I disagree with you on this I yield to your superior experience in this but I would argue nonetheless that what is disturbing about the great debate over Canadian foreign policy is that it continues to take place essentially within a mold that fits the world of the 1940s and 50s, not the world of the 1970s, and it is precisely those assumptions that I challenge.

• 1615

Mr. Macquarrie: In reference to image rating, as image building it is an inexact science. I do not know that my phrenology is any better than yours. I am not suggesting that it is; it is pretty imprecise. But are there doors now closed to Canada that are open to Sweden? And what doors would open if we were non-NATOized, or de-NATOized, I suppose.

Professor Brecher: Well, I am struck by the fact that Sweden can maintain diplomatic relations with Peking and establish diplomatic relations with Hanoi and incur, if you wish, displeasure to the extent of a diplomatic note from the United States but maintain a degree of access to the chancelleries of both worlds as well as to the chancelleries of the third world, which is quite unique. And I submit that this is possible because of the skill and because of the posture that Sweden has adopted and maintained with remarkable success over a period, in this case, of two decades since the second world war.

Mr. Macquarrie: But are not members of NATO such as Norway also in that position and still in NATO? I do not know about—you add Hanoi—I should not say that—but certainly with Peking.

Professor Brecher: I think not. For one thing it seems to me that Canada's potential

as a middle power is of considerably greater dimension than Norway, and furthermore the kinds of challenges that I speak of are not such that a relatively small state like Norway can take advantage of in the course of its diplomatic relations. I am not trying to make this into an open and shut case and if I have appeared to create that impression I regret this. I am simply trying to suggest that we must really begin, so to speak, to open our minds to new vistas that we had long assumed to be unthinkable, or as Herman Kahn once put it about nuclear weapons: one must begin to think about the unthinkable. And I suggest that if this debate on Canadian foreign and defence policy is to have the great educational value that I, as an educator, see as one of its fundamental objectives, then it is important to place on the table alternative options in foreign policy which have heretofore been dismissed as theoretical, visionary, unrealistic and irrelevant. I submit that they are precisely the opposite.

Mr. Macquarrie: Be assured—and I do not think I am just speaking for myself—that we are delighted that this is just what you are doing. It is extremely valuable and I do thank you for it. I have a couple more parts here, Mr. Chairman, although I do not want to monopolize the floor.

Mr. Allmand: May I ask a supplementary, Mr. Chairman? Mr. Macquarrie asked about doors that might open or close. Have you considered the amount of trade that Canada has with the United States and the amount of trade that Sweden has with the United States? Is it not possible that we might lose some trade or economic benefits and if so, would you still think it worthwhile to carry through this policy regardless of these ill effects on trade and economics? Is this a door that might close?

• 1620

Professor Brecher: I doubt that very much because it seems to me that economic relationships between states are essentially built and sustained on the basis of mutual benefit that accrues in tangible economic terms. I see no reason whatever why American investments or American trade with Canada should be affected at all by a change in political posture which is not antagonistic to the United States—and I am not suggesting antagonism—which does not imply an antipa-

thy to American policy but rather an assertion of a distinctive Canadian policy which may from time to time, indeed from time to time will find itself very closely akin to that of the United States. What I am inveighing against is what I regard as a kind of automatic responsiveness of Canada, and there are exceptions, but on the whole a responsiveness to American lead in the field of foreign policy which has tended, I think, to wither both the reality and what I call the image of a distinctive Canadian identity. But this is not to suggest that the important ties that link this country with the United States will automatically be sundered. I see no reason whatever for their being sundered because Canada should decide that in certain areas, specific issues, or what I call issue areas of defence and foreign policy, it should go its own way in an attempt not only to achieve its own national interest objectives, but also in global terms to strengthen bonds with a third world which would be prepared to accept on a basis of greater trust that kind of initiative from Canada than has heretofore been the case. So I do not see economic relations as being adversely affected whatsoever.

Mr. Macquarrie: You have discussed with us helpfully the question of our credibility with the non-aligned world. Is our credibility with the aligned world perhaps not worthy of a passing through? Naturally the head of state in NATO cannot publicly say what they think of our present introspection. Poor President Kennedy got into trouble for even saying publicly that it would be nice for us to be in the OAS. So that is that. But I am sure—I am convinced—that there would be no one in the chancelleries of the other 14 states that would welcome our withdrawal. Might there not be some diminution of our credibility with these people if we opted out?

Professor Brecher: Mr. Macquarrie, the only way I can answer this is to say that I agree with you at one level; that is to say, there will be varying degrees of disenchantment, expressed or unexpressed privately or publicly, but almost certainly privately, with what appears to be withdrawal from a club.

I would hope, from my own studies of the way diplomats behave and political leaders behave that this would also be accompanied by a new respect for Canada in the world even among these leaders and chancelleries, particularly because if they have the kind of

intelligence that I attribute to them, they will fully understand that this kind of path that we are now talking about does not *ipso facto* represent hostility to NATO or its members, does not represent a rupture in the relationships, but rather a broadening of Canada's relationships with other areas of the world which involves narrow-gauge withdrawal from direct military alignments but does not otherwise, I think, affect adversely the historic ties between Canada and the countries of Western Europe.

I would go further and say that if we are wrong in attributing that degree of wisdom and understanding to these leaders, I would still argue that the criterion on the basis of which Canadian foreign policy must be formulated is not whether or not other countries like it or dislike it, but whether or not this is in the interests of this country as we define those interests.

Mr. Macquarrie: I am not thinking of a popularity contest, but we could diminish our effectiveness if we decreased credibility with one group in the world community.

Professor Brecher: I must be fair and honest in saying that it is very difficult for me to measure quantitatively the comparative decline of credibility on the one hand, and the comparative rise in credibility elsewhere, in order to plot in quantitative terms an overall cost benefit ratio for Canada's place in world politics.

• 1625

Mr. Macquarrie: I find both of them hard to project at the moment. My final question deals with what I am old-fashioned enough to think is still the most important aspect of our foreign policy, that is bilateral relations with the country to the South. I believe you told someone this morning that you had not said that Canada should offer its air space to the United States. Would you advise that we deny it or attempt to?

Professor Brecher: I would, personally, because I regard it as unnecessary and I regard that as much more of an undermining of *de facto* Canadian sovereignty than the present kind of NORAD arrangement which seems to me to create the image, again, of a mutually satisfying and equally arrived at agreement but which, in effect, in terms of decision-making authority, has granted a

degree of legalized intervention in the defence policy of this country which would be infinitely greater.

Mr. Macquarrie: In recollection of the opening part of your paper, you discuss some of the classic cases of neutral states, and at a certain stage of development the wishes and the interests of some great power in propinquity to them terminated that status rather definitely as in the case of Belgium. I am wondering if, when it is still the point of view of the United States that participation in and over our air space is essential to their self-defence, to say nothing of continental defence, and so long as that prevails, we in fact have this freedom of movement and operation vis-à-vis neutrality, neutralism and non-alignment.

Professor Brecher: I think your point is well taken; that is to say, the United States no less than any other great power in history, indeed no less than any other state, will act in terms of its perception of its own national interests. If it regards control over Canadian air space as vital to those interests, NORAD or no NORAD, non-alignment or no non-alignment, it will act in such a way as to protect those interests. But in the same way, it seems to me to be perfectly compatible to talk about a Canadian posture of non-alignment in certain areas and issues, achieving certain goals, and in others, if you wish *ipso facto* and objectively because of our geographic continuity to the United States, having no control over the question of whether the United States will assert that domination in the presence or absence of a NORAD-type arrangement. I do not see these, in other words, as neat compartments that must at all times coincide with one another. The question of whether the U.S. will act, it seems to me, is irrelevant to the kind of over-all posture that Canada adopts to the rest of the world but the United States. Whether we are aligned or non-aligned, it will act over Canadian air space solely in terms of particular challenges to the United States at particular periods of time.

The question of whether or not we give them access to air space will not deter them. All I am suggesting is that if our concern is with the enhancement of Canadian independence and territorial integrity, a NORAD-type arrangement simply represents for me a façade of an agreement negotiated equally

between two parties in which one grants virtual control over the air space of another in return for protection. That protection will be granted anyway so long as the United States deems it vital, and that protection will terminate so long as the United States deems it no longer relevant to its interests, whether or not NORAD exists.

Mr. Macquarrie: I was thinking not only of military attitudes and performances and actions but of the very clear, cold, and to some, perhaps unwelcome fact that we need the United States economically much more than they need us militarily. At times in recent years we have had to call upon that favorite-nation attitude in order to restrain some undesirable factors in our economy. I can think of some of our ministers rushing to Washington to ask for the non-application of American legislation to Canadian investors. This I think introduces an area of sensitivity that makes us a little different from Switzerland.

• 1630

Professor Brecher: Mr. Macquarrie, if I may speak to that for a moment as someone from Quebec—I think this is a relevant remark. You know that the climate for investment in Quebec has become somewhat cooler in recent months and years, and yet it is striking that during this period the rate and volume of United States investment in Quebec has conspicuously increased. We have an interesting two-flow effect with Canadian funds moving out of Quebec to other parts of Canada and American funds moving into Quebec. This question has been raised rather frequently: how does one explain the willingness of the United States investors to establish branch plants in Quebec while Canadian investors move out? The answer is that to American investors a Quebec, even a separate Quebec, is a much more stable environment for investment than a great many countries in the world where the U.S. does invest. Apropos your point I would argue that regardless of what kind of foreign policy posture Canada pursues, to a would-be investor the climate that exists in Canada is still infinitely more attractive than perhaps 99 per cent of other countries in the world where American investment exists.

Again I would stress that there seems to be a kind of pre-occupation with the conscious

consequences that would follow if Canada were to mark out for itself, whether in whole or in part, a new path in foreign policy. I think this represents a misreading of the mind of the American investor for whom Canada is a natural and hospitable area for investment, regardless of its foreign policy, and I would almost go so far as to say regardless of whether or not Quebec remains an integral part of this country.

I do not know whether you accept this particular line of reasoning but I assure you that there is substantial evidence to suggest that American investors, whether in the Congo or other relatively unstable areas in the world, have not been deterred by much more traumatic events than the mere separation of the part of one country and the establishment of an independent state.

Mr. Macquarrie: A very good point. I suppose it depends really on how much they value the NORAD set up and this, at the moment, I do not know.

Professor Brecher: I cannot judge that really any more than you because here we are in the realm of classified materials and I simply do not have access.

Mr. Macquarrie: Thank you very much.

The Vice-Chairman: I have on my list Mr. Laniel, Mr. Thompson is not here so we will have to cross him, then Mr. Stewart, Mr. Hymmen, Mr. Gibson, Mr. Guay, Mr. Cañik and Mr. Allmand.

Mr. Stewart (Cochrane): Members may be interested in knowing that the stock exchange in Montreal was just blown up. They say it is in shambles.

The Vice-Chairman: Well that may not help the investment climate there. That is a sad supplementary.

• 1635

Mr. Laniel: Professor, on the last point you made in reply to Mr. Macquarrie you spoke of investments but you did not really speak of them in respect of the security or survival of the United States. Do you not think that even though Canada could become a non-aligned country, if at one time or another politicians in the United States felt that for their security or survival they needed, air bases in northern Canada or surveillance of our air space that they would apply sufficient pressure and, because of our economic link, force us into such concessions, which would bring

us to the same point as we are now or closely to it.

Professor Brecher: I would certainly agree that in that extreme situation the United States could certainly impose its will in the matter of access to air space, bases and the like. I would have grave doubts whether or not the military technology and weaponry that exists in the sixties is likely to escalate in the seventies the kind of traditional concept of bases an earlier period will apply. But in theory I think your point is well taken, that there would be really nothing to prevent that kind of imposition of will, as indeed super powers have imposed their will elsewhere in the world.

Mr. Laniel: As Mr. Anderson remarked while you were making that point, we would be in a similar position to that of Czechoslovakia if we were really linked with the United States. Why did the Russians decide to go in—because, as they saw it, it was in their best interests. However, it could be in the best interests of the United States at one time or another. You never know what might develop in the Middle East, let us say, and the United States in such a case might think of doing things like that. The saints are not all on one side and the bad ones on the other, you know.

Professor Brecher: No. The analogy may hold. I cannot deny this. Certainly it is a possibility that one has to contemplate.

Mr. Laniel: I conclude from what you say that you are looking for another role for Canada in the world. I am not sure that you have convinced me. I think we can agree between ourselves that the image of Canada is not that bad right now. I ask myself the question whether it is more important for me as a Canadian to see Canada in a neutral situation working to build up an image in the tiers monde or whether it is not more important to stay within an alliance, as we are now, with perhaps less involvement, and try to influence the alignment.

Do you not feel that Canada can be an influence? Would you agree with me if I said that I have the impression that Canada and other NATO countries might have had an influence on the decision of the United States to sit down around the table and start discussing the problem of Vietnam? Even brush wars

can develop into something much larger, and if they do there must be someone near the big powers within the blocs that will influence and try to bring some relief.

Professor Brecher: Let me comment, if I may, at two levels. On the question of Vietnam, again I am hampered by non access to documentation which my friends in External Affairs have.

Mr. Laniel: We did make a statement though.

Professor Brecher: That is a kind of closed system which I reject.

I think the evidence on the contrary is that the United States decided to set in motion discussions leading to negotiations and what will ultimately be some kind of resolution to that conflict only at the point at which its military advisers have accepted the reality which had been argued for a period of two years or more, that they could not resolve this conflict on the battle field, and all of the efforts that were made by the predecessor regime in this country and the travels back and forth of Canadian members of the ICC and other ex diplomats of the Canadian foreign service, as far as I am concerned, did not have one iota of influence on United States thinking or actions?

• 1640

I often think in this country that we pride ourselves on something which just does not exist and maybe it is necessary simply to solve and to make more meaningful our own role in the world.

I have often been told by people in External Affairs that we really have a significant moderating influence on United States policy. I fail to find it anywhere. It may well be that the United States makes decisions at times which happen to coincide with what Canada would like to do. But it is one thing to establish a causal relationship, it is quite another to establish a coincidental relationship. Great powers take advice only when that advice provides a rationalization for what they want to do anyway. I think that anyone who really assumes that this country exerts a restraining influence on American behaviour in the United Nations, Vietnam or where else is simply engaged in self-delusion. We all know how many statements were made by Mr. Martin in the United Nations and elsewhere on the bombing of North Vietnam, but when did

the bombing stop? It stopped only when the United States came to the conclusion that it no longer served a military or diplomatic purpose. We could then take claim for having pressured the United States into doing this but that, in fact, is a misreading of the situation. But I want to go to a more general point than that. That is on Vietnam.

Mr. Laniel: Does not the same principle apply to Sweden?

Professor Brecher: Let me try and answer it another way, if I may.

A number of members of this Committee have constantly refocussed my attention on Western Europe, NATO, the alliance, membership in the club, and so on. I think if you want to argue the future of Canadian foreign policy within those terms you can make an admirably sophisticated and logical case for the retention of Canadian membership in NATO and NORAD and for virtually no change in Canadian foreign policy. I argue the case in different terms.

Non-alignment for me is not in itself a policy goal. It is merely an instrumental goal. It is a technique by which certain objectives can be achieved. My premise is that as Canada moves into the 1970's the great issues of foreign policy are not East-West European relationships. Those have been stabilized for a variety of reasons which I need not go into here. They will remain stable either by the continued existence of the Warsaw Pact and NATO in their present form or by their transformation into some kind of all European security system. Canada's presence or absence in that stable relationship is of such marginal consequence that I do not regard it as worthy of debate. It is simply a way of continuing that which we did, and since it is comfortable we can continue to do so.

What I am suggesting is that the challenges for the next decade for Canada and the world are not Europe. The challenges of the next decade are how to bring about new equilibria between a developed West and North and an underdeveloped newly emergent world of some 60 weak, hesitant, distrustful states of non-white peoples who are clammering at the door and are determined that history which denied them much will no longer deny them in the future what they regard as their due. I do not want to get into the question of whether their reading of history is correct. All I am

suggesting is that there is a great challenge in re-establishing on a much more positive and firm foundation linkages between the established and affluent countries of the northern hemisphere and those of the south. Within that context, Canada can play a more meaningful role than in marginal contributions of the perpetuation of an alliance system which will continue to function whether or not Canada is a member. It is in that sense that non-alignment is meaningful to me—just because of the word. The word after all is simply a symptom of an attitude, behaviour, a way of looking at problems and trying to solve these problems. I cannot reiterate this in any more emphatic terms than I have already. To me the question is, do we look backwards to the forties and fifties or forward to the seventies? That is the issue I think on which this debate will ultimately rest.

• 1645

Mr. Laniel: Yes, but you did say in your analysis paper here that there are cases in which an aligned state mediates more effectively. There are cases when a neutralist is so emotionally involved because of its anti-racial anti-colonial issue that it ceases to have the value of a mediator, as in the case of Suez. You mentioned, in reply to the leader of the NDP party this morning, the acceptance of Canada within the UNEF force. You said it took 72 hours. To me 72 hours is immaterial. It is the things that you do. There might be a question, but it was the first time. After that I do not think Canada has been questioned as to its willing sincerely in fulfilling that job, and I think that problem is over now. The United Nations knows what we want to do, whether we are aligned or whether we are not aligned.

Professor Brecher: This, Mr. Laniel, seems to me a matter of interpretation. I respect your interpretation, and I think there are those who would share it and those who would not share it. It is an open question.

As to the earlier point that you read from my paper, I would simply note that that paper was written in 1961. The world has changed, it is almost a decade ago. If I were rewriting that and if I had the time to rewrite it now, I would rewrite that passage among others, simply because the nature of world politics at the end of the 1960s is, I

think, very different from that period of bipolarity at the beginning of the 1960s.

Mr. Laniel: Thank you, Mr. Chairman.

The Vice-Chairman: Mr. Cafik?

Mr. Cafik: You were talking about having a non-aligned policy and that, I gather, as a result of it we would be in a better position to work with the many numerous emerging underdeveloped nations in the world. I cannot see that being non-aligned in a technical sense or in the way in which you describe it would change the attitude of those nations to Canada. I do not know that they consider us a colonial power. We certainly are a white power, so the problems that they would have in respect to us in terms of racism would still be there.

In terms of alignment, if we said we were not aligned, I do not think we would fool anybody. All the declarations in the world to say that we are not aligned are not going to create the impression that we are unbiased in our approach to East-West conflicts that might arise.

Is the benefit the fact that we are going to turn more money toward the development of these things? Is it an economic benefit, as opposed to an alignment or non-alignment benefit?

Professor Brecher: There are, I think, two points to be made here. One is that we are dealing with the realm of the intangible. It is very difficult, I think, for a Canadian—any Canadian—to penetrate accurately into the thought processes of people who have lived under colonial rule. You are quite right in saying that most of the newly independent Afro-Asian leaders do not regard Canada as a colonial power. And historically, they know it was not a colonial power.

They do, however, regard Canada as an integral part of a Western, essentially Anglo-American, community. And they have certain objective indices which support the proposition that it remains an integral part of that community. Membership in NATO is one, voting at the United Nations is another, and indices of this kind.

When you ask if such a change in posture means simply a further expansion of Canadian foreign aid, I would hesitate to think that this would be the sole purpose of rationale or outcome of such a change. I am talking rather

of adding to the flexibility in international politics by contributing one more state to the small number which, because of its position—and I am using that word position not solely in geographic terms—but because of its conscious articulated policies, and because of its behaviour at the United Nations and elsewhere, can create links which are literally desperately needed on a planet which is fragmented in a variety of ways and full of fundamental distrust.

• 1650

The fact that Canada was not a colonial power does not *per se* make it acceptable. It may not even be acceptable as a non-aligned state. I am not suggesting that Sweden is now the darling of the third world, because you see, if you push me to that extreme, the change that would ensue is not so fundamental. But that is not the critical issue. The issue is what is the rationale for perpetuating the present policy. I do not find that rationale convincing. It is rather, "We did it before, let us continue to do it in the future".

I want to make clear that I do not wish to exaggerate the consequences of changing credibility, acceptability or influence of Canada in the world. It is rather that I see a dead end in past and present policy. And in terms of the two objectives that I set out in the early part of my remarks, for the next 10 years a distinctive identity and an image of a successful, bilingual and multicultural society—after all, many of these new states have the same kinds of linguistic and cultural problems that we have in a much more aggravated form—those two objectives, I submit, would be better achieved by this kind of departure in policy than the kind of stereotype continuation of a policy which, I feel, has not produced admirable results in Canadian national interest terms, but simply has been in the historic tradition, and that is no longer good enough.

Mr. Cafik: I do not agree with that. It is not a very positive argument, Mr. Chairman.

The Vice-Chairman: Mr. Stewart?

Mr. Stewart (Cochrane): Professor, many people have taken the habit of speaking of NATO and NORAD in the same breath, and I was glad that you made the point this morning that they should be looked at in two different ways and in separate contexts.

Let us for a moment put NATO aside and speak about NORAD. Mr. Macquarrie covered much of the ground that I had intended to speak about. Your idea seems to be that Canada should withdraw from the bilateral agreement of NORAD, because the United States is going to look after our defence in any case.

If we are in a position where another country is looking after our defence, does this not, by the fact itself, make us aligned?

Professor Brecher: No, I do not see this at all. The kind of argument that I would put forward here is that there seems to me to be a peculiar contradiction in the advocacy simultaneously of a world of non-proliferation in nuclear technology, and at the very same time, almost in the same breath, an extension in certain parts of the world that happens to suit X or Y, of nuclear technology. In other words, we have finally after almost a decade, reached the point where a nuclear non-proliferation agreement is about to take effect, with all kinds of reservations and certain key states not very happy, and indeed not even participating.

Yet, I take it that the United States, through its initiative in such a treaty, has committed itself in public to the proposition that the world is safer to the extent that the extension of the presence of nuclear weapons is reduced. At that very same moment, we have arguments in favour of the extension of nuclear technology to countries like Canada. I am submitting here that consistent with the underlying premises of nuclear non-proliferation as a condition for stability and tranquility, is the concept of de-nuclearization or de-nuclear zones. We have talked about this in Europe, we have also talked about it elsewhere, but thus far we have never really moved forward in this direction.

• 1655

I am submitting here that a pull-back from NORAD at the time at which this is possible, represents a step in the direction of de-nuclearization and the maximalization of the ideas that flow from a nuclear non-proliferation rather than a proliferation.

Mr. Stewart (Cochrane): Of course, the United States could never accept that view and I do not think that I would agree with that view either, because I regard this, as does the United States, as the same as the

defence of one country. I cannot conceive of a defence of the United States or of Canada which does not include the whole of the continent. And I think this was the very reason why NORAD came into existence. The fact that they must have our air space, that they must have a certain amount of control over the radar system and the communication systems that are in this country, is part of the over-all network of the defence of the United States. And as you said, whether we want them here or not, they would be here if they thought it was necessary for their security.

Is it not much better then to have them here with our consent? And not only that, but it seems to me that the United States has been more than generous with Canada because we have a very big say in what goes on at NORAD. One of our senior officers is either the commander or the deputy commander, alternately. And it seems that they have been very, very generous because what we contribute to the defence of North America is practically nothing as compared to what the United States does. And yet they have treated us as an equal partner, practically.

Do you not think that this is a happier situation than if we were to say, "You go it alone, because you are going to look after us anyway, but do not dare come into our air space"? Is this not creating new problems and tension?

Professor Brecher: It is very difficult to answer this kind of comment because I think it really moves us into an area almost of faith and interpretation of United States intentions and Canadian foreign policy aspirations.

I would disagree almost totally with everything you have said about American generosity towards Canada, its equality in the NORAD relationship. My reading of history tells me that great powers are never really generous beyond the point at which generosity happens to fit their interests.

Generosity is not a term, I think, that fits international politics or relationship with these states except as it is consistent with interests. There may be a Canadian deputy commander at NORAD. I daresay, to take an extreme case, if the Canadian Government were not co-operative in a situation in which SAC felt it were absolutely essential to do thus and so, it would do thus and so.

But that does not, I think, represent any kind of meaningful rationale for the per-

petuation of an arrangement which, on the surface, is a voluntaristically arrived-at agreement, but which in reality is a façade for legalized penetration of this country's air space and, to some extent, land space, and the presence of nuclear weapons beyond American soil, and ironically at a time when the United States itself regards the possible enemy for which those original radar installations were created to be no longer the primary enemy. We now talk about a new ABM system which is directed westwards rather than northwards.

In other words, the very purpose for which the radar installations in the north of Canada were originally set up, that purpose is regarded by American military strategists today as secondary, secondary in terms of a threat to the continental United States.

Mr. Stewart (Cochrane): But not eliminated?

Professor Brecher: Not eliminated. I would still submit that we must decide, not whether the United States will assert its will, and not whether it is in the interest of the United States.

I myself for as long as I can remember, have always been told that ultimately Canada must think in terms of what North America feels and thinks. I submit that the logical conclusion of that position is that Canada ought to merge totally with the United States, a position which I do not accept and which I think most Canadians would not accept.

● 1700

Now, one need not go from one extreme to the other. I am not suggesting that co-operation with one's natural geographic neighbour is undesirable. The question is, at what levels with that intensity, in what situation, as compared with what alternative options of policy present themselves to achieve whatever objectives we set for ourselves. If our objective is not to alienate the United States, then I would agree that everything you have said is a desirable policy. However, I do not think, non-alienation is a sufficiently legitimate foreign policy for an independent state. There must be something beyond that.

Mr. Stewart (Cochrane): Do you not agree that our relationship with the United States is a rather unusual one. It is not like the rela-

tionship between the United States and Mexico or any other country. In fact, they regard Canada as almost part of their own country.

Professor Brecher: I think they do that primarily because, by our behaviour over a longer period in the past than I can possibly remember, we have made it possible for them to so believe. That does not justify its perpetuation in the future.

Mr. Stewart (Cochrane): I would like to make one remark regarding the way Canada is viewed abroad. I believe your opinion is that if we were non-aligned with anyone, that we would perhaps have greater influence in the third world, and particularly in the African and Asian countries. I suppose in theory this can be argued from both sides all night long, but in actual practice I think we have very recently had a very, very good example of this, and it is one with which I am quite familiar. I am referring to the desire on the part of both sides of the Nigerian war to choose Canada over every other country, even though we are white, even though we are North American, even though we are almost a satellite of the United States and even though we are a member of NATO. They would prefer to have us entering into mediation than any other country.

An hon. Member: Ethiopia first.

Mr. Stewart (Cochrane): I do not believe that is so. In fact, Ethiopia has taken that initiative. However, I do not think they prefer Ethiopia. In my discussions with both sides they indicated they would like to see Canada take this role. I do not think in practice your theory necessarily holds up in the Nigerian situation.

Professor Brecher: You may be right in the Nigerian case, and here I yield to your knowledge. I would only say that the Nigerian problem and Canada's policy towards it seems to me to raise even more fundamental questions about Canadian foreign policy. I do not know, Mr. Chairman, whether this is the time or the place to enter into this, but if I were to do so at length—and I will not—I would say that I have followed with astonishment—and I think shame—this government's behaviour in that civil war, particularly with respect to the issue of Biafra. I have written about this in the public press and I find that the degree of indifference in this country to

one of the great human tragedies of this century is something which all Canadians who are conscious of public affairs will look back upon in the years to come as one of the least attractive chapters in the history of Canadian relations with any other part of the world.

Mr. Stewart (Cochrane): What would you suggest we do?

Mr. Allmand: We should have had Professor Brecher with us when we were studying question before.

Mr. Stewart (Cochrane): The question is by no means solved.

Mr. Howard (Okanagan Boundary): Mr. Chairman, on a point of order.

I am very interested in Professor Brecher's answers and the questioning that is going on, but I am a little concerned as time goes on some of our questioners are going to be missing and perhaps some of the points that people want to bring up will be missed. Would it be possible to speed up the questions and the answers a little more; otherwise we are going to miss some of the things that are going on here today, and I do not want to miss anything.

The Vice-Chairman: I think it would be advisable if the questions were more succinct and probably they could be cut down a bit in scope and number. I do not think we want to get back into Biafra at the moment. I think we should continue more along the lines laid down at the outset.

• 1705

Mr. Stewart (Cochrane): I only asked two short questions, Mr. Chairman. In fact, since 11 o'clock this morning I have been quite quiet and I have let everyone ask a whole lot of irrelevant supplementaries, and so on.

The Vice-Chairman: I can understand your fears, Mr. Howard—and I share them—that we are going to get into a big discussion of the problem in Nigeria and Biafra.

Mr. Stewart (Cochrane): I do not want to do that, but as our guest has expressed an opinion which perhaps could raise a number of points, possibly we could ask him just to give a short explanation of his view on this matter without pursuing it, and I will not ask any further questions.

The Vice-Chairman: I do not think it should be pursued very far, Mr. Stewart,

because we can get into expressions of opinion as to what other countries are doing in this area, and so on, and it can go very far afield.

Mr. Allmand: We spent nearly a month studying this question, Mr. Chairman. I think these are important questions but we could really range all over the map in foreign affairs.

The Vice-Chairman: Perhaps bearing in mind what is being said...

Mr. Stewart (Cochrane): I will bow to your decision on that but I do not like to see it left in the air. Professor Brecher has given an opinion in which he has criticized the government and I would like to see that cleared up.

The Vice-Chairman: I think perhaps Mr. Stewart should have an opportunity to put his question. He could make it succinct and perhaps we could have a short answer.

Mr. Howard (Okanagan Boundary): Yes, I was as concerned about getting answers that were perhaps a little longer than we need as I was about the long questions.

The Vice-Chairman: Thank you, Mr. Howard.

Mr. Winch: I do not give a hoot how long the answer is as long as we are getting information.

Professor Brecher: I would merely intervene, if I may, by saying that university lecturers are accustomed to lecturing at great length, so if at times they try your patience, I offer my apologies.

The Vice-Chairman: Mr. Stewart, could you put your further question.

Mr. Stewart (Cochrane): Professor Brecher, if it would not get us involved to any great extent, could you give us a brief idea of what you think Canada should be doing in this regard?

Professor Brecher: I would like to be quite clear about one point. I think a distinction has to be drawn between a human tragedy and the question of political intervention, although at times that borderline is not easily maintained because any act tends to spill over into other acts. I, as well as many others, have been perplexed and disturbed by what I would regard as a kind of casualness and almost indifference to that human tragedy on the part of many spokesmen in authority. I

think the magnitude of that tragedy is now known and I think anyone who doubts it is simply closing his mind to a stream of authentic evidence that has come out of Biafra through qualified sources. I know there were difficulties in the early stages and yet I cannot help believing that the kind of direct government involvement in the alleviation of that human tragedy that this country was capable of by virtue of its resources and its access to authority in Nigeria would have contributed significantly to the reduction of that distress. I have the feeling that it was very much like Mr. Chamberlains' remark in 1938 at the time of Munich when he was asked about Czechoslovakia; he referred to it as that far-off land. Biafra, too, is a far-off land but in many ways the inability of this country at the level of government to respond to that kind of tragedy I think speaks volumes of words.

Mr. Stewart (Cochrane): Thank you, Professor Brecher.

The Vice-Chairman: Do you have any further questions, Mr. Stewart?

Mr. Stewart (Cochrane): No, thank you.

Mr. Guay (St. Boniface): I will be very brief, Mr. Chairman. I will stick to the topic you are here today to discuss and I will not deviate from it. This morning you mentioned the fact that if there was any change in Canada's policy it would affect Sweden. In fact, I believe you said that it would cause a wrench. I thought you could perhaps briefly explain that particular part of your statement.

• 1710

Professor Brecher: It would cause a wrench?

Mr. Guay: A wrench; you used the word "wrench".

Professor Brecher: A wrench in what?

Mr. Guay: I am not sure. I noted the last part of the sentence while you were speaking. It would certainly cause a problem somewhere, in regard to the effect on Sweden, if we were to change our policy. Am I wrong in making that statement?

Professor Brecher: I think perhaps it was in another context. I must confess I do not recall it. It may have been in the context of Canada's withdrawal from NATO, the ques-

tion of whether or not this would cause a wrench in the working of NATO in Europe, and my answer was that it would not; that Canada's presence or absence was marginal to NATO's performance in Europe.

Mr. Guay: All right. You are speaking of neutrality, and would you agree that neutrality exists only as long as no country challenges that neutrality?

Professor Brecher: I do not think that is true. There are certain neutral states which withstand pressures on that neutrality and some are incapable of so doing, as Belgium was in 1914. I think Sweden has persistently resisted pressures which frequently come to the front pages of our press by the Soviet Union on its northern borders, or other states, but particularly in the case of the Soviet Union. It does so, of course, by the presence of substantial military capability. I do not think it is correct to say that neutral states can remain neutral only so long as all other states accept that status.

Mr. Guay (St. Boniface): I was going to say that if we were to follow your suggestion to be neutral, do you not think that possibly we would have to go to the superpowers and ask them to permit us to be neutral?

Professor Brecher: I think what you are referring to here is a permanently neutralized state which conducts its policy in such a way that it can never enter into any kind of alliance which could offend other powers. I am not suggesting permanent neutralization of the Austria type. I am talking about non-alignment with a neutralist active element of the Swedish type as distinct from the Austrian-Swiss-Laos type of permanently neutral or neutralized states.

Mr. Guay (St. Boniface): If we were aligned with the United States, as we are now, it is because we agree with their policies. Do we have more voice because we contribute, we take part in the NATO program?

Professor Brecher: This is the argument put by defenders of continued Canadian participation in NATO. I do not accept that argument because I find no evidence to support it. There may be evidence but it will not do for the experts to say to us, "We have the evidence but we cannot tell you". If the evidence is there, then we have a right to know what

it is. In the absence of that forthcoming, I will simply conclude there is no evidence.

Mr. Cafik: Professor Brecher, you talked a lot about neutralism and neutrality. I was not here for your opening statement this morning there was another committee meeting I had to attend, but I presume that you at least stick by the general principles outlined in this article that was issued to us. You speak of neutralism as interventionist; in other words, a positive force as opposed to the negative force that you describe as neutrality, which is an isolationist approach to things. You then go on and talk about it as being non-aligned. I presume you mean non-aligned with the superpowers. In other words, you could have a group of aligned, non-aligned states, and this would be quite consistent with your policy or with your approach to things. Does it follow that your approach to neutralism means to be unarmed or unprotected? That does not follow, does it?

Professor Brecher: No, and I fear I made that clear this morning when you were not present. We discussed this matter as to whether or not I was advocating a total abandonment of any defence capability, and I said no.

• 1715

Mr. Cafik: I asked some of the members of the Committee just what you said this morning and I got the impression that you had really advocated a kind of limited use of arms, or a limited presence of arms, but I gained the impression that it was not to such a sufficient degree that it would protect that neutrality.

Professor Brecher: That is quite right. I argued in advance that Canada's independence is protected regardless of our own indigenous Canadian defence capability. 21

Mr. Cafik: All right. That is a very odd statement to make. You talk of non-alignments and yet in answer to that question you speak as if we are aligned or would continue to be aligned. If we are already protected, against whom are we protected? Against Russia, against China? If we are not aligned we have to be equally concerned, I presume, about protection against the United States or against NATO or any other power in the world.

Professor Brecher: I mean by that simply that objectively by virtue of Canada's geo-

graphic contiguity to the United States there is built into that situation a posture on the part of the United States which would prevent, in its interests, the control of Canada by any other outside power.

Mr. Cafik: But what about itself?

Professor Brecher: I take it as a high probability that the United States would not, itself, intervene in a direct military sense though I am prepared to argue in theoretical terms that if it ever reached the point where it regarded this as vital to its national survival, it would do so, and it would do so whether or not Canada is formally aligned with it or non-aligned. In other words, that balances out. It is irrelevant to the question of Canada's policy posture in foreign affairs generally. I am arguing that Canada in a sense is the unique recipient of an objective defensibility, not because of its defence budget or size of armed forces, but quite impervious to that, because of that geographic position and because of its importance to the United States. That does not make us consciously or positively aligned. It makes us, in a sense, necessarily dependent for the continued territorial integrity and political independence upon what the United States would do. What the United States would do, it would do regardless of our defence policy.

Mr. Cafik: Yes, I can appreciate that and I have no argument with that particular approach, but it seems to me rather an odd thing, recognizing the fact that we have the protection of this American umbrella—and I suppose kind of happy that we are protected because of our geographical position—that we would then, sitting under the umbrella, adopt an approach that we were totally neutral or neutralist?

Professor Brecher: Let me clarify it. There may well be cases in specific policy issues where Canada's interests will coincide with those of the United States—a great many—and in those issues it seems to me to be perfectly logical that if it were a matter of voting at the United Nations, they would vote in the same way; or, elsewhere they would adopt policies which would be virtually indistinguishable one from the other. That, however, is a very different thing from saying that, as a kind of blanket rule, the Canadian participation in alliances of which the United States is the principal member virtually dictates non-

deviation from that policy position. There are minor exceptions. What I am suggesting here is that a policy of non-alignment does not mean Canada would consciously differ from the United States in every policy issue. It may well be that as these policy problems arise, they will find themselves together, but they will do so on the basis of criteria which I regard as very different from those criteria which led to Canadian policy decisions in the past.

Mr. Cafik: Pursuing this a little further, I have the impression that you feel that our alignment in such alliances as NATO and NORAD have a tendency to reduce our flexibility, yet I think the facts would indicate that we have adopted a rather flexible approach. We have opposed the United States in certain areas, such as, in Viet Nam, recommending the reduction and the elimination of bombing, and so on. We have taken independent positions with our allies in terms of the Suez crisis and in other areas, and I am sure we will in the future. So on our over-all policy, although generally speaking it is more favourable toward the disposition of our

• 1720

allies, which I think is true in reverse as well, there are times when we do approach things in a totally independent way. Now, by going through the facade—and I would call it a facade of neutrality—you seem to think it was a facade of having freedom and being able to exercise our rights by membership in NATO. I think to tell the world that we are neutral is a much greater facade when, in fact, the disposition of the people of Canada, in my view, the disposition of the government, is not really neutralist. So I think that is a facade. You do not seem to mind that kind of a facade—or maybe you do not think it is one.

Professor Brecher: No, I do not.

Mr. Cafik: How do you make such a distinction, that one is and the other is not?

Professor Brecher: Much of this is a matter of degree, if I may say so. You are quite right in saying that the fact that Canada has participated in United States-led alliances has not prevented her on occasion from taking quite independent postures on policies. I think this is a matter of degree. It seems to

me that your line of argument logically suggests that there are literally no constraints on the freedom of action of Canada in foreign policy by virtue of its presence or absence in NATO, NORAD or any other such arrangement. I find this logically an indefensible position.

Mr. Cafik: No, I did not say that.

Professor Brecher: No, no. Let me proceed then. If there are constraints, then the question simply is, what is the nature of those constraints? Would those constraints be qualitatively significantly different by non-participation in those alliances? I am arguing that they would be and that, therefore, the range of flexibility and its scope, and the frequency with which Canada would adopt an independent position in foreign policy, would be that much greater than has been the case over the past 20 years, which is not to deny that on occasion it has done so within that framework.

Mr. Cafik: All right. I think this is the last question or it might lead to another supplementary. Again I go back to this point that the neutralist claims, as I quote from your statement here in your document, that it can best remain out of war by preventing war. There are many ways that a neutralist could adopt certain approaches and policies in a positive way to prevent the occurrence of war. If we were a neutralist state, as you envisage, and we feel that one of the greatest contributions we can make to the prevention of war would be to align ourselves with Europe and say that we consider this a vital area, that if an attack is made on that area that we ourselves, although we are not a belligerent, do not want war and do everything positive to avoid it, but we would consider something to be the last straw and would have to go to the defence of that area, that, according to your terms of reference, could be the act of a neutralist state.

Professor Brecher: It could be but I would regard it as a distinctly less significant area of focus for Canada for the simple reason that the evidence is overwhelming during the past 15 years that the kinds of overt conflict likely to lead to escalation, involvement of great powers and superpowers, with the result of not conflicts in Europe, western or central, but in many other regions of the world where we have had these peripheral wars, if you

wish, or brush-fire wars, and it is precisely in that kind of conflict that Canada can make a meaningful contribution, at least in my judgment, far more meaningful than an air brigade in Europe. In other words, I think what we have to weigh here is first, where are the regions of likely conflict...

Mr. Cafik: I agree.

Professor Brecher: ...going to be in the next 20 years, and I am convinced they are not going to be in Europe. I think the evidence is clear on that.

Mr. Cafik: Could I pursue that? Perhaps the reason it is not going to be in Europe is because of NATO.

Professor Brecher: But even, if it is NATO, Canada's role in NATO is of no consequence to whether or not NATO deters or does not deter because its involvement is so small that many people are simply unaware of it. I am distinguishing between NATO in its totality and Canada's role in NATO.

Mr. Cafik: For instance, what is Canada's contribution to NATO in terms of strike force in Europe?

Professor Brecher: You tell me.

• 1725

Mr. Cafik: I understand it is 10 per cent. Is that insignificant?

Professor Brecher: I am saying that the United States and other allies in NATO do not regard the Canadian contribution, as distinct from Canadian membership in NATO, as of consequence. The withdrawal of Canada would not affect the Alliance in terms of its tangible deterrent capability in Western Europe.

Mr. Cafik: Would you suggest that other countries in NATO follow the approach you recommend for ourselves?

Professor Brecher: I do not really regard that as within my jurisdiction at least, not this afternoon. I do not think the issue for Canadian foreign policy is what other countries should do. The issue rather is, what are Canadian interests in global terms? Does Canada's participation in NATO contribute to those global interests as compared with alternative options available to Canada? That is the realm I think for at least my legitimate commentary. It is not on what a Norway or a

Belgium or other west European state should do.

Mr. Cafik: This is my last question. There have been, I understand, about 50 sort of localized wars since the end of the Second World War. Not one of them, to my knowledge, has been in Europe. Not one of them has led to an international war. Many people seem to feel that the stakes for the superpowers are highest in Europe. They feel the stakes in Africa are not so high, the stakes in Asia are not quite as direct, and consequently there is real possibility that the superpowers are not going to go to war over some matter that is of no direct and immediate and global significance; they are not going to unleash a nuclear war over such a matter. But the possibility of such a war being unleashed in Europe is very great; in fact, some maintain it is the only way that such a war could ever occur.

Professor Brecher: Well, I think that is antediluvian thinking on the part of those who see Europe as the place where over the past 20 years the greatest danger of world war has come. Let me note that in the last two years alone we have had the kind of perpetual conflict in the Middle East where on more than one occasion we talked about the danger of a Middle East conflict escalating into a global confrontation. It did not, because fortunately the superpowers were intelligent enough to realize that the gains from such a confrontation would be nil; the cost would be so fantastic as not to contemplate it.

Mr. Cafik: That is my argument. Right.

Professor Brecher: But I find not a single shred of evidence, at least in the last 10 years, that anything could break out in Europe which could lead to that kind of nuclear conflict. On the contrary, what I find is a remarkable stabilization process. If you wish to argue that NATO contributed to this, so did the Warsaw Pact; but apart from all that Canada's role in NATO can hardly be described as central to the stabilization process in Europe. You may say, "Well, if all the other 14 members of the club thought the same way, what would happen", and the answer, I think, is that even if that highly remote possibility were to come to pass, the Soviet leadership knows, I am convinced—and there is evidence that it does know—that

in the last analysis, whether a NATO exists in the formalized sense or not, a Western Europe as perceived by the United States in terms of its vital interests is no longer fair game or open country, even if it is penetrable. I think this preoccupation with Europe is really a throwback to an age when Europe was the centre of the universe in interstate conflicts; it is no longer, and it has not been since 1945. It took a Suez war to make the world realize that a United Kingdom, which had emerged from the Second World War with much of its empire still intact, was essentially a second-rate power. It may take another 20 years for us to realize that Europe may be important but it is no longer the area where the gut issues of conflict exist. The areas where those sources of conflict exist are in the essentially unstable, highly demanding, newly emergent states which have not yet achieved the very first foundations of stability to be able to function, in long-run terms, as members of the international community. That is where the brush-fire wars occur; that is where they can escalate without any realization of their consequences.

Mr. Cafik: Do you suggest we get involved in those brush-fire wars?

• 1730

Professor Brecher: No. I am saying that Canada's role ought to be to contribute to the hastening of the time process of moving from colonial rule to stable societies not alone because this is too big a job for Canada or even the United States alone to do it. But that is not the question. It is not in either or terms, nor is it a question of Canada versus the world. The question is rather narrower: does Canada have legitimate, possible, viable, alternative option in world politics? My answer is yes. The costs would be less. Defence budgets, I submit, could be cut. Canada's image could be enhanced. It could make a contribution to the challenges which we can only now dimly foresee which in my judgment are going to dominate international politics for the next one or two decades.

Mr. Cafik: Just a last comment: when you say that the costs could be cut, I think that is open to very serious question.

The Chairman: Mr. Allmand.

Mr. Allmand: Professor Brecher, your main suggestion or recommendation is that we

change the emphasis of our foreign policy so that we can act more or less as a bridge to the third world. I am going to put certain propositions to you for your comment.

It has been suggested—some people suggest—that we might be able to do this through other ways more directly and regardless whether or not we withdrew from Europe or NATO. For example, about a year or so ago during the Caribbean conference here in Ottawa it was suggested by many people that we try to form much closer links with the Caribbean countries perhaps even form some kind of economic union with the Leeward Islands. I was one who was very enthusiastic for that. There are still a lot of people in Canada who look forward to the day when perhaps we will have some special links with the Caribbean.

I am suggesting here that we—Canada—become part of the third world and I wanted to hear what your comments are on that. I think you are a specialist in India and Pakistan from reading some of your background, and therefore I want to know your comments on our continuing efforts in the Commonwealth, which is predominantly a black and yellow association.

The white countries are a minority group and actually Britain, which is the biggest country in it, is no longer a great world power, so it is becoming an association dominated by black countries, really—India, Pakistan, and so forth. I would think there is a great area there for us to build bridges and also in the black francophone countries. That is one thing. I think bridges can be built there regardless of what we do in NATO, Caribbean, Commonwealth.

Also you said to look to the seventies, not to the forties and the fifties. It would seem to me that we cannot overlook that in the seventies the United States is going to become one of the biggest and most powerful black countries in the world. I feel that we will not see the end of the seventies before there will either be a black president or vice-president of the United States. That is what I feel. The ambassadors to Europe and to the world in the United States will be probably one-third black before the seventies are finished. Therefore, the United States will become very much part of the third world, much more than Europe will be.

I want to look forward to these alternatives and be a part of it. I will just ask for your

comments on the Caribbean, the Commonwealth possibilities of building these bridges?

Professor Brecher: I think you have stated extremely well the kinds of important and viable options that exist for building these Canadian links with the third world. I would say most emphatically that not only is there a potential vis-a-vis the Caribbean, but there is one which has only recently come into being as a potential departure for Canadian policy, and that is in Latin America.

• 1735

Latin America in a very real sense is part of that third world, because while it is true that independence in the formal political sense came to much of Latin America a century more ago, they represent in terms of economic underdevelopment, social cleavages and the nation-building process, part of that vast third world. I think there is a potential for the expansion of Canadian links in the Caribbean and, along the lines that you suggest, I would agree wholeheartedly. I think in Latin America, primarily through bilateral association, there is an extraordinary potential here that has never been tapped.

As to the Commonwealth, I would agree with you again that this has now become essentially a multi-racial but predominantly non-white forum of some 28 states in which Canada, as a senior and respected member, has a natural entrée and access to much of the third world.

Finally, I would agree with you that the very bicultural and bilingual character of Canada has given this country an asset vis-à-vis the French-speaking states of Africa that was long ignored and has only now belatedly come into the picture of Canadian foreign policy-making.

Now, in all of those avenues I would agree that there are possibilities for growth and development in order to build these links, but if these are to be maximized in terms of Canadian national interests I submit that both because of the defence costs of the retention of existing alignments and the psychological costs that spill over in our relations with the third world, they can be maximized by withdrawing from traditional commitments and redirecting our energies along the lines that you have just suggested.

Mr. Prud'homme: Perhaps you could pass your views to the premiers of the three Prairie Provinces concerning the bilingual charac-

teristics of Canada. Needless to say, I share your view entirely on this point.

The Vice-Chairman: Are there any other question? That concludes our list of questions, Professor Brecher, and on behalf of all the members of this Committee I want to thank you very much indeed for your fine presentation. Certainly it is quite clear that the members of the Committee were very interested; you can tell that from the number of questions asked and the length of time that we have asked you to stay with us. I think you have probably set a record for questions for this Committee.

Mr. Allmand: Could we move to include in our Proceedings the statement of Professor Brecher that was distributed?

The Vice-Chairman: Will it be in order to so move? This is the "Neutralism—an Analysis" statement.

Mr. Allmand: Comments were made about it in our questions and also at the beginning by Professor Brecher.

The Vice-Chairman: It would be in order for you to so move.

Mr. Allmand: I move that it be printed as part of our Proceedings.

Motion agreed to.

APPENDIX HH

Neutrality: An Analysis

Michael Brecher*

The term "neutrality" has evoked strong emotions in recent years. Various words are used interchangeably: neutrality, neutralization, non-alignment and neutralism. The result is widespread obscurity about its meaning and implications for world politics. A brief semantic exercise may set the stage for a more rigorous analysis.

Neutrality is simply a legal status of status of states which demand certain rights of the belligerents in time of war and accept certain obligations towards those belligerents. It is a status which comes into existence only after a war has begun. It is, therefore, a term to designate a particular status in a period of over conflict; and a neutral state is one which practices neutrality, for example, the United States between 1914-17 and between 1939-41.

There are situations in which states proclaim themselves in advance desirous of avoiding participation in any war at any time. These states, if they are favoured with special geographical positions, if they happen to be small enough and not especially attractive to the more rapacious Great Powers, may then be given a status of *permanent neutrality* or *neutralization*; that is to say, in terms of power politics, they are removed from the arena of conflict. In time of war, these states accept the obligations and demand the rights of all other neutral states. In time of peace, they accept the fundamental obligation never to join an alliance which could conceivably involve them in war. In modern history there are four outstanding examples of this type, namely, Switzerland, neutralized in 1815, Belgium in 1831, Luxembourg in 1867 and most recently, Austria, in 1955. Only Austria and Switzerland remain as permanently neutralized states, which in effect have abandoned any pretensions to an active role in world politics, though they claim to be sovereign states and may even, as in the case of Austria, join the United Nations.

Non-alignment, by contrast, is a political status. It refers to a state which declares itself aloof from bloc conflicts; nothing more. It proclaims itself free from *a priori* alliances, notably military entanglements with any bloc or great power anywhere in the world. It also asserts that it will judge all policy issues "on their merits". This is not neutrality, however. It is, rather, the passive, first stage of neutrality.

Neutrality has in common with non-alignment an expressed desire to remain aloof from bloc conflict. But neutrality goes much further, for it involves a positive attitude towards bloc conflicts. A neutralist state assumes an obligation to help reduce tensions between blocs with a view to maintaining peace or bringing about peace, and more particularly to prevent the outbreak of war. In other words, non-alignment is the policy guide of the neutralist state, but neutrality represents an attitude and a policy which are much more activist than non-alignment as such. India is the outstanding example of the *neutralist state*. Sweden is a good example of the *non-aligned state*. And, as I suggested, Switzerland and Austria are *neutralized states*. In time of war, any state, whether it be Turkey or Sweden or the United States, which manages to remain aloof from the conflict, is a *neutral state*. This semantic exercise suggests a crucial link: both neutrality and neutrality derive from the same basic aspiration, though they use fundamentally different techniques because of the changed character of the world political system in which they have to operate. In short, neutrality is a contemporary expression of the time-honoured theme of neutrality.

We may explore this proposition by glancing at the origins and evolution of neutrality. As early as Kautilya's *Arthashastra*, a text on politics and administration in ancient India, there was a recognized concept of neutrality as one of the six possible roles of actors in inter-state politics. The Greek city-state system, of course, had a rather sophisticated view of neutrality both in theory and practice. Thucydides, in his account of the Pelop-

* Department of Political Science, McGill University. This article is based upon a lecture to the Dunster House Seminar on India, Harvard University, April 1961.

ponnesian War, refers quite frequently to states that were neutral during that war. If there were no neutrals in the Age of Rome, it was simply because Rome was a hegemonial state that would not countenance the idea of aloofness from conflict. But as we move towards another state system in which there was a multiplicity of units with comparatively equal power, for example, the Italian city-state system, neutrality is revived in theory and practice. And from the 15th to the 19th century neutrality as a legal status emerged full blown as a result of conflicts on the sea. Indeed, it was over trading rights and duties, and the claims of states that wanted to engage in commerce, while others were engaged in open hostilities, that the problem of neutrality arose. A painful conflict developed between neutrals who claimed the right to trade and belligerents who claimed the right to contraband or to take over ships if they interfered with the conduct of hostilities. Over a few hundred years there emerged in international law, both in custom and in treaty, recognized rules of neutrality. These reached their zenith in two important Hague Conventions in 1907 and the Declaration of London in 1916. This represented the high water mark of neutrality.

It was precisely at that point that technological changes in the character of warfare occurred, making neutrality almost passé. In the First and, more particularly, in the Second World War, when the stakes were total and character of the conflict was total, the belligerents were unwilling to accept the niceties and nuances of international law; the result was that they interfered with neutral rights whenever they could. The only states in the Second World War which managed to remain neutral were those that were favoured by geography or were sufficiently armed so that invasion would be more costly than the value of conquest to the invader, or were useful as listening posts, such as Turkey, Sweden and Switzerland. All through history, then, one finds the development of the idea and the status of neutrality. By the Second World War it was no longer respected by belligerents. Nevertheless, the aspiration to neutrality in the past continued. And that aspiration was to remain aloof from war.

It is in this sense that neutralism emerges as a policy version of the classic status of neutrality. There are basic differences, of course. Neutrality is isolationist and neu-

tralism is interventionist. The neutral contends that one can best stay out of war by being impartial towards all the belligerents, claiming certain rights and performing certain duties. The neutralist claims that it can best remain out of war by preventing war. This is the heart of the case for neutralism. For, argues the neutralist, in the changed character of war—the development of nuclear weapons, bi-polarity and ideological conflict—even if one could stay out of war, as the neutral did, it would not be particularly desirable, because one could not neutralize oneself against the adverse consequences of thermonuclear war. Therefore, the only way to remain out of global war is to do everything possible to prevent the outbreak of global war.

It is interesting to note in this connection the policy evolution of the leading neutralist state. From 1947 to 1950, Delhi's posture was strikingly similar to classical neutrality, with the frequent expression of hope that India could remain outside a war, should it occur. After the Korean War, however, there was a realization that non-belligerency or neutrality were not sufficient. And so India moved to the second stage—an open rejection of the leadership of both blocs but still passive in its orientation, that is, non-alignment. In the early 'fifties India moved to the third stage—a positive role in world politics and attempts to alleviate tensions with the ultimate purpose of avoiding a global conflict, in the belief that this was the *sine qua non* of India remaining free from war. Mr. Nehru most recently has gone beyond neutralism because of its verbal associations and called this a "Positive Policy for Peace".

II

Staying out of war, the initial aspiration to neutrality, is one of the sources of neutralism—but it would be a grave error to assume that neutralism is merely a twentieth-century response to that age-old problem. On the contrary, there are many sources *sui generis*. The great merit for the practitioners of neutralism is that the objective source of traditional neutrality and the subjective sources that flow from their conditions happen to coincide, indeed, to blend very well. Together they provide a powerful inducement to the policy of neutralism.

We may now look briefly at some of the specific sources of neutralism, focussing on India as the prototype. This is apart from the external setting—the character of world politics, the presence of nuclear weapons, the technological changes of the last fifteen years, and the awareness that war between the super-powers *ipso facto* means a war for all. These sources fall into two logical categories, material and non-material. The two key material mainsprings are geo-political and economic in character. The geo-political pressures on India are obvious to anyone who looks at a map. Indian statesmen are aware of the overpowering pressure of the Sino-Soviet axis on the Indian subcontinent. This does not mean that they are constantly conscious of hostility, but they are aware of the geo-political facts of life for an India which is essentially weak, which has rarely known unity, which is economically underdeveloped and which finds itself strikingly inferior, both in economic and military terms, to a Moscow-Pekin bloc. In other words, the geo-political conditions leads to a simple policy of non-alienation of two very powerful neighbours, particularly when those neighbours are allied to each other.

That geo-political facet is strengthened by the seeming remoteness of all other countervailing centres of powers. History tends to underpin geo-politics here because of Indian awareness of frequent land invasion of the sub-continent; this is accentuated in turn by the Partition of 1947 and by a weak Pakistan. In other words, the facts of geography and resultant geo-political pressures create in the Indian decision-making élite a powerful inducement to a policy of non-alignment, though not necessarily of neutralism.

The economic factor is no less important. It arises from the objective fact of economic underdevelopment and the subjective aspiration for material progress. That is to say, the desire to expand sources of foreign aid, whether capital or technical assistance, whether co-operative, through international channels, private or public, creates a strong inducement to maintain the lines of communication with both Soviet and Western blocs as the two important sources of economic strength. There is, in addition, a deep conviction that war anywhere, whether in Laos or the Congo or in Cuba, or anywhere else, is dangerous. It raises the level of tension

between the two blocs, heightens the prospects of major war, and therefore reduces the prospects for economic growth, apart from the holocaust effects of global war itself. There is, then, an intertwining of objective and subjective pressures towards a policy of at least non-alignment or passive non-involvement in blocs.

Among the non-material factors, one may mention the legacies of history and philosophy. The legacy of history is twofold, but the two are so closely related that they constitute one driving force in the foreign policy of all neutralist (and most non-aligned) states: "anti-colonialism" and "anti-racialism". These have strong policy implications and overtones. Both derive from experience with the Western World. This is very significant, for both tend to off-set political and economic affinities with the West and lead to greater tolerance of Soviet actions than would otherwise be the case. Whenever any great Western power is involved with a small power, whether in the Western Hemisphere, or more particularly with an Afro-Asian state—where it is accentuated by racial overtones—there is an instinctive response of condemnation. This is not true of Soviet actions, simply because the experience of India and other neutralist states with the Soviet bloc was different; in fact it was non-existent for a long time. These twin elements, "anti-racialism" and "anti-colonialism", are even reflected in something like the neutralists' attitude to Cuba, remote as it is from their interests.

As for the legacy of philosophy and tradition, the notion of tolerance in Hinduism and Buddhism merits attention. This has certain implications for Indian, Burmese and Ceylonese policy. The idea of tolerance is deeply embedded in Hindu-Buddhist society, and it has the political consequence of rejecting automatically all claims to the totality of truth, justice and good in the world. The idea that many different religions have equally valid claims to contributing to the total understanding of truth reflects itself in the political realm in the rejection of the absolute perspectives of either the Marxist ideology or Western democratic beliefs. There is the reluctance to accept any claim to absolute truth, justice or good, with the resultant blunting of the tone of their participation in conflicts that arise between East and West. Tolerance tends also to strengthen the material inducements to non-alignment, namely, to

remain apart from the world outlook of both sides, which claim a totality of truth. Taken together, these external and internal sources create an integrated and powerful inducement to neutralism.

III

Two cases which reveal important aspects of Indian neutralism are the Korean War, and Suez and Hungary.*

The most striking feature of India's role in the Korean truce-making settlement from 1950 onwards is the extent to which it alternated support from one side to another. On the four major issues that arose in the Neutral Nations Repatriation Commission (NNRC), India's chairman agreed in letter with the Polish and Czech delegates to the Commission but sided with the Swiss and Swedes in *action*. These four examples were on: (1) the use of force at the time of the repatriation of prisoners; (2) the dismantling of prisoner-of-war organizations during that period; (3) the extension of the explanation period when prisoners were being persuaded as to whether they ought to return to their homelands; and finally, (4) the ultimate disposition of the prisoners of war.

From the very outset, in June 1950, India voted for United Nations condemnation of North Korea, but it insisted throughout that North Korea ought to be heard in the Security Council. India opposed the crossing of the 38th parallel, but after all efforts to bring North and South Koreans together at the conference table seemed to be exhausted, India agreed to the crossing. India refused to condemn China as an aggressor in 1951 yet she maintained her ambulance unit in South Korea throughout the war. On the prisoner repatriation question, she drafted a resolution which favoured the Western position for the most part but with enough modifying clauses to make it palatable to the Chinese and North Koreans. As for India's role in the Neutral Nations Repatriation Commission, one finds this curious, perhaps unique, capacity to satisfy both sides on all the major issues—the positive contribution of neutralism in that case.

* A careful and valuable study, from which the following analysis has benefitted greatly, is B. S. Steinberg, *India's Neutralism in Theory and Practice* (unpublished Ph.D. thesis, McGill University, 1961).

On the breaking-up of the prisoner-of-war organizations, India agreed that this was undesirable; on the other hand, it agreed with the Poles and Czechs that it would be desirable to segregate the leaders of these prisoner-of-war concentrations because of the trouble they were causing; then it proceeded to turn round once more and say that this would be very difficult because it would involve the use of force, and the Commission did not have enough force to do this. On the question of the right to use force, India agreed with the Polish and Czech delegates that there was nothing to prevent it in the terms of reference of the NNRC but added that the use of force was a major, substantive step and should not be taken without unanimity in the Commission. Since this was lacking, force was not used.

Another example concerns the extension of the explanation period, which was to be 90 days. The Polish and Czech members of the Commission pointed out that of the 90 days about 50 days or more were wasted because the U.N. and South Korean Commands were not acting in a way to facilitate explanations. According to the Communist delegates, "90 days means 90 days for explanations, and therefore, the 90-day period ought to be extended until there were 90 full days of explanations". The Indian Chairman agreed "because the prisoners had in reality only 40 days". "On the other hand", said the Swiss and Swedish delegates in effect, "the terms of reference provide specifically for 90 days from the beginning of the explanation period; therefore, explanations must cease exactly 90 days thereafter; according to the letter of the NNRC, the 90 days period has ended, so there must be no extension". Indian agreed.

Finally, the Korean settlement provided for a return of prisoners only after a political conference took place. "Well", said the Polish and Czech delegates, "the prisoners must remain in the compounds until a political conference meets [the proposed 14-power conference]". The political conference never took place. Indian agreed and so it could not officially transfer them to civilian status. But, unilaterally, it did restore the prisoners to the detaining sides without violating the letter of the NNRC.

Is this not a curious type of policy? Not at all. The Indian motive was clear, and I think consistent with neutralism. It was mainly to keep the Commission alive and to achieve the

important objective of a Korean settlement. The phrase "to judge every issue on its merits" does not mean to judge it, in the narrowest sense, on the merits of each tactical issue as it arises; rather, on the larger merits of reducing the level of international tension. By this unusual capacity to satisfy the four delegates to the Left and Right, India did bring off a Korean settlement. Not everybody was satisfied. But the record demonstrates that on the whole the NNRC was a major success in mediation in difficult circumstances.

The significance of the Korean episode in terms of neutralism is something else again. In so far as anyone in the Western World knew what neutralism was, and not many people did—not that many know even now—it seemed rather peculiar. To most people it was neutrality, and neutrality was isolationist. As a result of the NNRC the stigma of isolationism attaching to neutralism was terminated. People began to ask themselves the question, "what kind of neutrality is this, when the neutral state actively intervenes in the settlement of disputes? This is not classical neutrality". Of course it wasn't, but since neutrality and neutralism are almost identical words it was assumed that they were the same policy or status.

In the Suez and Hungary episodes, India's response was strikingly inconsistent. Both of them were clearly invasions; without getting into the legal technicalities of aggression or non-aggression, they were both invasions of foreign territory by alien troops. Yet Indian invoked a peculiar double standard on these two issues. In the case of Hungary, India stressed what it called the broader implications of the problem, and in the case of Suez it adopted a narrower approach. Nor was this purely chance. To Delhi the Suez War was an attempted return of Western powers to an area from which they had recently withdrawn, an act not likely to win support in Asia. Hungary was blurred. Certainly it is always easier for Indians to identify themselves with Egyptians than with Hungarians. To most Asian and African leaders violence between whites and other whites is bad, but violence of whites against non-whites is infinitely worse. And there are two levels of response to overt conflict involving a European and an Asian, or two Europeans. The latter is true of two Asians as well, as revealed by the incapacity to identify Japa-

nese imperialism in the 'thirties and 'forties as of the same *genre* as Western imperialism of earlier epochs. It tended to be relegated to the category of the special case. Because it involved Asians and Asians, it did not have the same emotional impact as the British-French assault on Suez.

There are, I think, two further reasons for this inconsistency. First, criticism is expected in the Western World, Indians assume; that's part of the fabric of a constitutional democracy, they say. Westerners don't really mind it; they tend to flourish on it; and sometimes it has effect, as the criticism of British action by the British Labour Party and certain American and Commonwealth groups revealed. But criticism of the Soviet bloc meets a stone wall and is only likely to alienate without having any positive effect. Secondly, Hungary was viewed as a cold-war dispute which, if exacerbated, would lead to a higher level of tension between the Soviet and Western blocs. Suez was not, Suez involved a weak Afro-Asian state and two powerful Western states (leaving Israel apart, in this context). This was a case that did not have the likelihood of aggravating the cold war, unless the Soviets became directly involved. In short, it differed basically from Hungary, in India's view.

That glaring differences did exist in the Indian response is amply revealed by the records of the United Nations. The Indian reaction to Hungary was mild and slow, painfully slow, painful even for them in 1956. The Indian reaction to Suez was harsh and quick. Within less than 24 hours Mr. Nehru, on the basis of a single press report, used such highly-charged terms as aggression, invasion, dastardly actions and so on. The demand for withdrawal was immediate and sharp in the case of Suez; it was not in the case of Hungary, at least not for a long time.

India's role in Korea reflects one aspect of neutralism—the belief that a neutralist state has a positive role to play in relaxing tensions. Suez and Hungary reveal other aspects, notably the crucial role of "anti-colonialism" and "anti-racialism" in the response of neutralism whenever a former colonial power of the West is involved with a non-Western colonial area.

IV

The criticism that is generally levelled at neutralism is two-fold. One is that it is immoral, that it doesn't distinguish between

good (the West) and evil (the Soviets). The second is that it is, in fact, a basic political error, that self-interest requires full and active participation by neutralist states in military alliances with the West.

On the question of immorality much can be said. Suffice it to note that Indian leaders, because of the legacy of tradition and tolerance, do not accept this conception of absolute morality or absolute immorality in the ideology of the two major blocs in world politics. Their perspective is much more blurred. It is grey and grey rather than black and white; the notion of Soviet immorality seems unproven to the Indian.

Regarding the alleged political error, the following general propositions may be made. First, mediation is not a monopoly of neutralism; indeed, there are cases in which the neutralist state fails when it attempts to mediate. There are even situations when an aligned state mediates much more effectively than a neutralist state. In other words, the pretensions of some neutralists to a monopoly over the mediation of international conflicts is to be seriously questioned.

The Korean, Suez-Hungary and Laos cases reveal that India is more likely to offer mediation in a cold-war dispute involving the super-powers, that this offer is more likely to be accepted in that situation, and that it is more likely to be effective in those conditions. In Korea, India's attempts at mediation between 1950 and 1953 failed on every occasion. It succeeded only when certain conditions had been created, conditions in which there was a clear-cut military deadlock, in which the super-powers were embarrassed and wanted to extricate themselves from an awkward position, because the cost of continuing warfare beyond 1953 was too great in terms of whatever goals could be achieved. It was only in the conditions of stalemate and the desire of the super-powers to find a way out by diplomacy that a neutralist effort at mediation succeeded. In other words, it was the special conditions of Korea in 1953 that made India's effective mediation possible.

There are cases in which an aligned state mediates more effectively. These are cases when a neutralist is so emotionally involved because of anti-racial and anti-colonial issues that it ceases to have the value of a mediator, as in Suez. It was Canada, an aligned state, a participant in Western military alliances, that

was capable of initiating the UNEF proposal which ultimately led to a more tranquil Middle East. India had forfeited any claim to the role of mediator because of its involvement, because of the overlay of the anti-racial and anti-colonial elements.

In the case of Hungary, Indian neutralism didn't succeed, partly because only one super-power was involved, and there wasn't sufficient countervailing strength for the neutralist to intervene. Only under special conditions can India's neutralism make a positive mediatory contribution in international relations.

Nor does the neutralist state have a monopoly in its *desire* to preserve the peace. Other states share this goal. The difference lies in their conception of the appropriate techniques. The aligned state sees virtue in an occasional limited war, the neutralist state never, because of the conviction that limited war is likely to heighten tension. The aligned state sees the preservation of peace as best achieved by a military alliance, by "bargaining from strength". The neutralist sees the preservation of peace in opposition to military alliances on the grounds that they have a vicious-circle effect, one spawning the other.

Thirdly, I think it is true to say that in a normal cold-war dispute like Korea, only the neutralist state has sufficient trust of the super-powers to mediate successfully. Canada couldn't do it in the case of Korea; it could sit as one of the five members of the Commission, but it was identified with South Korea. Similarly Poland couldn't; only India could.

There is a good deal of confusion about the kind of role neutralist states can and do play in international relations. Is neutralism merely a 20th century variation of the balancing process? I think not. The basic difference is that the United Kingdom in the 19th century had sufficient power to prevent the outbreak of war or, if war broke out, to throw its weight into the scales in such a way as to ensure victory for one or another of the participants. Today no state can be a balancer in the 19th century sense simply because the gap between the power of the two super-powers and all others is such that the addition of the power of India or anybody else won't make any difference. In short, neutralists cannot deter global war by their possession of military power. If global war breaks out they can do nothing to determine the outcome.

All they can do is to try, by persuasion and other means of that kind, to prevent the resort to war by the super-powers, because of the realization that only then can they stay out of war itself.

We come now to the final proposition, which is that neutralist states play a stabilizing role in international politics just by being neutralist. First of all, they provide an important channel for diverting the surplus energies of the super-powers from direct conflict to peaceful competition for the support of the neutralists. An analogy may be drawn here with the 19th century, the "Hundred Years Peace" between 1815 and 1914, when there was no global war. One of the major reasons was that the great imperialist powers of Europe at the time were able to divert their energies from direct conflict to the division of much of Africa and Asia into colonial empires. They could avoid direct military conflict because they had enough to keep them happy and busy elsewhere! In the middle of the 20th century, neutralist states in Asia and Africa can perform a similar, though not invidious, role. That is to say, instead of carving them up, the two blocs

can reduce the likelihood of direct conflict by diverting their energies into a very time-consuming and very beneficial competition in the form of economic development and aid among the states of Asia and Africa. It is in the interests of the neutralist states to be non-aligned because, *inter alia*, they derive economic aid from many states, and war is thereby made less likely. It is in the interests of the super-powers, I think, to have a zone of competition and ultimately co-operation, for this zone, the neutralist zone, offers a tolerable alternative to military warfare.

The second facet of this proposition is that a totally bloc world, in other words, a totally bi-polarised world, in which all states are aligned with one or another of the super-powers, is rigid and therefore dangerous, with the temptation to play for the big stakes, since there is only one rival to total domination. The neutralists perform the valuable function of a cushioning effect, increasing the flexibility of the system. They may also provide, as India does, a link between the hostile blocs and sometimes mediation, a necessary role in bi-polarised politics.

CURRICULUM VITAE

MICHAEL BRECHER

February—1969

PLACE AND DATE OF BIRTH:—Montreal, Canada; March 14, 1925.

—Guggenheim Fellowship, 1965-66.

—Canada Council Grant-in-Aid of Research, summer 1968.

EDUCATION:—

B.A. McGill University, 1946; First Class Honours in Economics and Political Science. Allen Oliver Gold Medal. Allen Oliver Graduate Fellowship in Political Science. (Alexander Mackenzie Scholarship in Political Science 1944-45; 1945-46.) M.A. Yale University, 1948 (International Relations). Ph.D. Yale University, 1953 (International Relations).

PUBLICATIONS:—

BOOKS:—

—THE STRUGGLE FOR KASHMIR, Ryerson Press, Toronto, and Oxford University Press, New York, 1953, pp. 216. (Published under the auspices of the Canadian Institute of International Affairs and the Institute of Pacific Relations.)

—NEHRU: A Political Biography, Oxford University Press, London, Bombay and New York, 1959, pp. 682.

—Abridged Edition, Oxford University Press, London and Bombay, 1961. pp. 267, and Beacon Press, Boston, 1962.

—Translations in Hindi, 1961; German, 1965; Italian, 1966; Japanese, 1968.

—THE NEW STATES OF ASIA, Oxford University Press, London, Bombay and New York, 1963, pp. 226.

MINUTES OF PROCEEDINGS

[Text]

Tuesday, February 18, 1969.

(42)

The Standing Committee on External Affairs and National Defence met at 11:05 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Anderson, Barrett, Cafik, Fairweather, Forrestall, Gibson, Groos, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, Lewis, MacLean, Macquarrie, MacRae, Marceau, Penner, Prud'homme, Ryan, Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch—(25).

Also present: Messrs. Buchanan, Danson, Gillespie, Roberts, M.P.'s.

Witness: Professor Kenneth McNaught, Department of History, University of Toronto.

Mr. Roberts drew attention to two errors on page 904 of Issue No. 25 of the Minutes of Proceedings and Evidence. The Committee agreed to the corrections.

The Chairman introduced the witness, Professor Kenneth McNaught, University of Toronto. Professor McNaught made an opening statement.

Members questioned Professor McNaught, with particular reference to views expressed in his advance presentation to the Committee.

The Committee agreed to print the following as appendices to this day's Minutes of Proceedings and Evidence:

Professor McNaught's advance presentation entitled *Non-Alignment For Canada* and his curriculum vitae; (*See Appendix ii*)

List of Bilateral Defence Agreements Between Canada And Other Countries (page 882 of the Evidence refers); (*See Appendix jj*)

Letter to Professor McNaught dated July 31, 1967, from the Director, Home Branch, Department of Manpower and Immigration, Ottawa. (*See Appendix kk*)

The Chairman thanked Professor McNaught for his interesting testimony and the Committee adjourned at 1:40 p.m. The next meeting will be on Thursday, February 20, 1969 at 11:00 a.m., when the witness will be Mr. David Golden.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Tuesday, February 18, 1969.

The Chairman: Gentlemen, we have with us this morning, Professor Kenneth McNaught. A detailed biographical sketch of Professor McNaught and his qualifications has been distributed to members of the Committee. Professor McNaught tells me that he will not be available this afternoon, so we should try to plan on completing our questioning this morning.

Without going into further detail as to his qualifications which are very impressive indeed, I will simply introduce Professor McNaught to you. I might also mention that a summary of his evidence has been distributed to members of the Committee. If anyone does not have copies, the Clerk has additional copies here.

I will call upon Professor McNaught who will summarize the statement that has already been distributed to members of the Committee.

Professor Kenneth McNaught (Department of History, University of Toronto): Thank you very much, Mr. Chairman. Most of you have copies of this and perhaps some of you have even had time to read it. So I will summarize and perhaps read what I think are particularly, from my point of view at any rate, pertinent parts of the argument.

My essential case is that I think it is very important for Canada to develop a policy of non-alignment, and that to do so requires withdrawal from the military alliance system composed essentially of NATO, NORAD, the defence production sharing agreements, and the permanent committee on defence in North America.

At the beginning I argue that one of the principal points put forward by supporters of non-alignment has been that our alliance membership has prevented us from taking such useful initiatives as the recognition of the Chinese Government. I suggest that it might be argued that the fact that we are now apparently engaged in preliminary talks in Stockholm, looking toward the recognition of China, that this may be a counter-argument and may suggest that, in fact, our military alliance commitments have not been as restrictive as some of us argue. So I would like to read this paragraph as part of the argument:

What, then, is the context of our decision to negotiate the recognition of China? We do so in the environment created by acute political crisis in the United States. That crisis resulted directly from the insistent need to end the war in Vietnam. And any permanent settlement in Southeast Asia can scarcely be arranged if the United States continues its demand to maintain the faltering diplomatic ostracism of China. Thus, while Mr. McCloskey clucks disapprovingly in Washington, no one . . .

perhaps I should say nearly no one

. . . in Ottawa takes this as a serious signal to stop the play. Perhaps, but not necessarily, it would be too much to speculate that we had been quietly invited to make our move now. But certainly it would be too much to suggest that the move was a bold assertion of independence and proved that alliance membership does not inhibit us from pursuing policies strongly disapproved by the senior member.

● 1110

And I go on then to argue that that move toward the recognition of China came very belatedly and that we are still inhibited, along all the other lines about non-alignment, from taking what I consider to be proper initiatives. Furthermore, we are, by the military alliance system, necessarily directly associated with some of the most disagreeable actions going on in the world, and I want to read a paragraph on that.

From Greek repression to Portuguese imperialism to American slaughter in Vietnam—we are directly tied by the alliance system. Equally, by that system, we have prevented ourselves from exercising a freedom of action at the United Nations and on other fronts that might well have contributed to a reduction of international tensions.

And I argue that in fact we cannot effectively and convincingly support a non-proliferation nuclear treaty while we, ourselves, argue that we are protected by the largest nuclear power in the world. We can hardly tell Egypt or Israel or Pakistan not to

take the bomb while we glory, apparently and officially, under its protection.

I think then that there is a real credibility gap between the generally conceded knowledge that there is no defence in a nuclear war, and our admitted dependence upon the military alliance based upon the dominant nuclear power.

I argue that there is an historical background for essentially a militarily non-aligned policy in Canada, and it comes from the readings of most of the militia bills of the early years following Confederation, when, in fact—and perhaps I can put this most briefly by reading it—we believed:

that the only danger of attack lay in a breakdown of relations between Britain and the United States—and that the chief burden of defence would therefore be upon Britain. The main difference a hundred years later is that our protector . . .

the United States, not Britain

. . . could not protect us.

I think we could argue that if Macdonald and Cartier had believed that Britain could not protect us, we would have had Dominion status a lot sooner than we did.

But the real point I think is that we should revoke a policy of military alignment because it is defended largely on a myth. And I think it is a core part of my argument—and I go perhaps beyond where some of the other witnesses have gone, who may have vaguely supported this point of view—that we should not argue that withdrawal from the military alliance system results from our belief that the United States has to defend us. It seems to me that that is a credibility gap in some of the arguments.

We should say plainly, if we are to have a realistic and honest policy based on what we know to be the case, that there is no defence. There is only the appalling danger that civilization will be annihilated if all states do not recognize what in fact will happen if nuclear war breaks out.

In other words, I think we ought to use a position of military non-alignment quite consciously as an international image. It should not be an image of aloof Swedish or Swiss neutralism, but an image of genuine concern which reflects, I think, the real beliefs of the Canadian people rather than the tired outdated shibboleths of power.

● 1115

I think you can again sustain the argument for non-alignment by an historical reference. When we

were being pressed by London in the fourth quarter of the nineteenth century to join a *kreigsverein* of the British Empire, our argument usually was that the biggest contribution Canada could make to the defence of the Empire, was to make Canada safe and to build Canada up economically. And occasionally someone like Sir Charles Tupper would argue that this building of the CPR was, in fact, a contribution to the military strength of the Empire. But no Canadians really believed that, and certainly no Englishman did.

On one occasion Captain Mahan of the United States, who was to that period of 1890 much like Henry Kissinger is to the 1960s—I would argue a founder of American imperialism—suggested that the completion of the CPR under British aegis in Canada was a dagger pointed at the heart of American military power. But I do not think that many Americans or Canadians really believed that.

In other words, we were non-aligned militarily even while we were members of the Empire, and it was not until we quite unnecessarily aligned ourselves militarily in the South African war that we got into serious racial trouble, and that crisis deepens steadily.

I think there is a real lesson to be learned, and I would put it this way. In periods when the military expenditures which we can afford are insufficient to affect in any significant way the international balance of power, we are best advised to put all our effort into proving that a multi-racial state in the modern world can survive without atomizing itself and can develop a cultural life as rich, or richer, than that which can be afforded by nations which devote preposterous proportions of their national income to doomsday weapons.

Professor Eayrs, and I will not go over his argument, has already proven to my satisfaction, and I do not know to how many members of the Committee that would be equally true, that we could pare about a billion dollars from the present defence budget and still have ready a sufficient para-military force to be used at the service of the U.N. if and when it was needed. These savings, it seems to me, could well be spent on the alleviation of poverty and the enrichment of culture in Canada, and on extensions of our foreign aid program which is now, as Mr. Gellner pointed out earlier, abysmally low amongst the developed nations of the world. It seems to me that it would take a very powerful argument indeed to say that we would not do more for the peace of the world and for even a narrowly conceived Canadian national interest by spending that billion dollars in that way rather than on weaponry and personnel which virtually everybody agrees does not basically affect the power of the alliance structure.

It has been argued, and it is a powerful argument I gather in the East Block, that the real reason for Canada continuing in the military alignment of NATO is so that we can contain West Germany's ambitions both territorial and with respect to gaining nuclear weapons. More recently it has been argued that the Russian intervention in Czechoslovakia completely justified that, and I gather that was given as a reason by our present government for not moving faster on any consideration of withdrawal from NATO. I think that argument is not plausible. The intervention of Russia, it seems to me, was a direct response to what Russia considered, rightly or wrongly, a threat emanating from NATO to detach Czechoslovakia from the Communist orbit. So that, objectively, the Russian intervention in Czechoslovakia is no different in kind from American intervention in Guatemala or the Dominican Republic or abortively in Cuba. I would agree that it was a reprehensible military action to preserve a sphere of influence, but the point is it was an action of the kind that NATO was never designed to prevent and therefore to use it as a further argument for maintaining NATO, it seems to me, is supremely illogical.

I do not really believe that many Canadians think that West Germany is restrained from military adventures by the fact that we have a few thousand troops in West Germany. It seems to me as part of this argument of non-alignment that it would be fair to put the case on the same grounds as the case for Canada joining OAS, that is to say, the real case is not, should we get out of NATO. The real case is, why are we in? I argue that there are many, many instances of the restrictions which that membership imposes upon us that strongly suggest the desirability of getting out.

● 1120

Membership in NATO has been used often to support our support of the American war effort in Viet Nam, and I want to make a particular point about that because sometimes it is said that we are neutral or objective or do not support it. We do, in fact, and any reading of Hansard shows that we support the theoretical argument for the United States being in Viet Nam. Any reading of the American record shows that because Canada gives aid only to South Viet Nam we are listed by, for example, General Westmoreland as a supporter of the United States, and in the Spring of 1967 when 360 professors sought open repudiation by Canada of the American intervention in Viet Nam and a halt to the export of Canadian arms destined for Viet Nam to the United States, and the letter went to Mr. Pearson, Mr. Pearson replied:

Confidential and quiet arguments by a responsible government are usually more effective than

public ones. . . Too many public declarations and disclosures run the risk of complicating matters for those concerned. . . The more complex and dangerous the problem, the greater is the need for calm and deliberate diplomacy.

Well, that is, of course, the classic defence of quiet diplomacy. Presumably, quiet diplomacy went on in 1967 and 1968 but it had no effect, and it seems to me once again what had an effect was the American political crisis and the kind of action that we were proposing then, that is to say, of trying to block the sending of Canadian arms to the United States for use in Viet Nam, would therefore have had more effect on the ending of the war by helping a little bit to precipitate the American political crisis than the quiet diplomacy that presumably was going on.

The other point, if you agree that quiet diplomacy was not terribly effective, was that a very real part of our policy was effective and that was the active promotion of war contracting for the United States in Canada. The Canadian Commercial Corporation did not falter and did not use very quiet diplomacy. It had some very glossy advertisements and pamphlets showing how to get in on the gravy. I wanted to read a quotation again from Mr. Pearson's letter because it seems to me it is at the heart of the matter as to why we are not non-aligned and of what alignment really means, or why we could not openly repudiate the American invasion of Viet Nam. In that letter he first of all reviewed the extent to which our defence production has been integrated and mentioned the technological and mass production advantages we get from that, and went on:

For a broad range of reasons, therefore, it is clear that the imposition of an embargo on the export of military equipment to the United States, and concomitant termination of the Production Sharing Agreements, would have far-reaching consequences which no Canadian government could contemplate with equanimity. It would be interpreted as a notice of withdrawal on our part from continental defence and even from the collective defence arrangements of the Atlantic Alliance.

I think that is as concise and authoritative a statement as we have yet had on the inter-connection between our actual policy and our military alignment. I think that we have to review, then, all of the implications of that military alignment. They are very subtle and they go even beyond that purely economic inter-relationship to which Mr. Pearson referred so pointedly.

They go into almost all areas of our policy and I want to take only one further example. I know it is an irritating one and I do not do it lightly. I think it is an

important one because it shows the extent of the implications of the military alliance.

● 1125

This concerns our immigration policy. Most Canadians I think have believed that Canada has been in some sense an asylum, as the United States has been, for people from the British Isles and Europe. They believe that as a mark of our independence and liberalism that we have instructed our immigration officials not to enforce foreign laws or not to snoop into the political beliefs or military obligations of intending immigrants. Had we done that previously, a large number of Sir Clifford Sifton's immigrants in sheepskin coats would have been sent back to fight for the Imperial armies of Russia or Austria-Hungary. So that, when young American war-protestors sought asylum here and a number of them had difficulty getting in, the draft dodgers, public concern mounted and the immigration policy was modified and they were allowed in, but at the same time—and this is the important point—the department did make a quiet reservation. It claimed there was a difference between draft-resisters and deserters and it continues, as was demonstrated by four or five impulsive young students from York University a week or so ago, to reject deserters from the American Army. To me, the important point is that it does so as policy, although most Canadians undoubtedly assume that if an American refuses to fight in Viet Nam and deserts when he is ordered overseas he will not on that account be denied admission to Canada.

In the spring of 1967, I asked the department on what grounds it pursued the policy of rejecting, as policy, deserters. At first I was told it was an obligation springing from our NATO commitment. When I objected that I could not find any commitment under NATO arrangements they said it sprang from the NATO Visiting Forces Act. Well, it does not, of course, because that governs forces on service in Canada, and I want to quote from the letter I have which finally cleared the point up. It is an official letter in reply to an official inquiry that I made, and it says:

It is quite true that the NATO Visiting Forces Act is applicable only to foreign military personnel actually on service in Canada, and that consequently a foreign soldier who comes to Canada after deserting somewhere else is not subject to its provisions. I am sure you will agree, however, that neither Canada nor any other member of NATO would be acting in the spirit of the North Atlantic Treaty if it granted immunity within its borders to deserters from the military forces of other members of the Alliance.

I think you can go through a very broad range of Canadian policies in all matters and find the direct impact upon our thinking and policy of our military

alignment, and my chief case is that in most cases the impact is illiberal, it works against political independence and it does so unnecessarily because the military alignment does not in any sense protect us. It does, of course, as Mr. Robert McNamara said before a Senate Committee in the United States in 1965, by putting a couple of Bomarc sites here act as missile bait for Russian missiles, but I scarcely see that that is defence.

There is one final point, and that is the argument which I very often hear that because we are so timid within the alliance system we would probably be no bolder if we merely withdrew from the system. That is probably a strong argument. There is an answer, I think, however and that is, if, as a result of this present review, we were to decide upon military non-alignment, that decision would have to rest upon a political debate that would go far beyond these walls. It would be a debate which, as I suggested, would have to concern every substantive issue in domestic and foreign policy, and if that debate were to produce a majority for non-alignment it would also produce a majority which would demand extensive public planning of investment, resources development, cultural growth and the production probably of a limited range of conventional armaments under public ownership in Canada.

I can see no other way than by closely examining the total implications of our military alignment by which we can really define the true interest of this country or, indeed, discover the extent to which Canadians are willing to pursue those interests.

Thank you, Mr. Chairman.

The Chairman: Thank you very much Professor McNaught. Mr. Fairweather.

Mr. Fairweather: There are just two or three matters I would like to pursue. One is the recognition of China. Do you think there is any validity in the idea that the United States welcomes Canada's initiative and that really to have a press secretary replying to what is a fundamental change in policy shows that the U.S. really rather likes this as a pilot project for their own inevitable recognition of China?

● 1130

Professor McNaught: Mr. Fairweather, I do not like the use of the word "inevitable" as an historian, but in general I think I do agree. We are obviously very much too close to this particular development and have very little documentation on it, but I agree with your surprise about the extremely limited and modified response from the United States to our preliminary talks. Thus, it seems to me at least reasonably open to speculate that our moves toward recognition of China are not disagreeable to the United States and possibly that is part of the reason they are now being made.

Mr. Fairweather: And is it not true that several senior United States senators and other leaders of opinion met as recently as January in Santa Barbara to try to chart a course for American recognition?

Professor McNaught: Yes. I think the pressures from people like Senator Fulbright and the whole range of liberal senators has been very strong to change American policy on this. That being the case, it probably would not be the first time that Canada has moved as a kind of bellwether.

Mr. Fairweather: Would it be a fair analogy to suggest that Canadian initiative in commercial contact with China was in itself welcome in the U.S.?

Professor McNaught: I am not sure how far one would want to go in supporting that argument. It seems to me that the resistance of—and this is very hard to document too, but there is some documentation on it—American branch plants in this country to the development, and particularly the highly initiative development, of sales in Communist countries suggests that up until the present the United States has not been too pleased about extensive commercial relations developing that way.

Mr. Fairweather: In our United States—Canada interparliamentary group I was astounded to find the change in American policy among what might be thought to be almost neutralist, midwestern people who saw that a sale could empty their storage.

Professor McNaught: Yes.

Mr. Fairweather: You mentioned, sir, the freedom of action that non-alignment would give Canada in certain directions. I am not joining issue on this at this time because we have not written our report, but what change would we make, for instance, in the military government of Greece or the imperialism of Portugal in Africa just by withdrawing from NATO? I would like this developed, if you do not mind.

Professor McNaught: Mr. Fairweather, I was not suggesting that Canada could bring about the change of a foreign government. I was resting most of the case upon the desirability of creating a different image of Canada so that she will not be held suspect or hypocritical in the United Nations or elsewhere. It seems to me that our relationship to the non-proliferation treaty might be a good deal more convincing if we abandoned the argument that we were defended by the bomb. The point about even referring to Greece and Portugal is, of course, that some Canadian war material does get through Portuguese channels to help suppress a revolt in Mozambique, and things of that sort. I agree that in practical terms that is not a very significant influence and Portugal can get the weapons somewhere else. However, in terms of the image and

the credibility of Canada being military aligned to Portugal, which is an extremely reactionary military power in Africa, is not a good imagine. It seems to me that in order to defend that military alignment one would have to make a far more convincing case about its absolute necessity for Canada's national interest to be in it.

Mr. Fairweather: You think of us—to use a current advertising cliché—as sort of a worldwide Mr. Clean. This is the Utopian . . .

● 1135

Professor McNaught: I see the thrust of your argument, and heavens knows I am not suggesting that we should further the idea that so many Americans quite properly—many of colleagues and students amongst others—see of terribly self-righteous, prissy Canadians keeping their skirts clean, when in fact they are not. But I am suggesting that the idea of a non-aligned image is not necessarily the idea of moral purity, but that it is in fact a more realistic policy based on a clear recognition of the actual facts of influence and defence and risk that the one of military alignment.

Mr. Fairweather: Mr. Chairman, I would not mind going to the bottom of the list. There are many other people waiting to ask questions.

The Chairman: Thank you, Mr. Fairweather. Mr. Howard?

Mr. Howard (Okanagan-Boundary): Mr. Chairman, I have a personal comment I would like to make. I was interested in your comparison between Canada of 100 years ago and Canada today. I was rather surprised that you would make such sweeping generalizations of a nation 100 years ago. Surely we are a very different nation today than we were at that time. It would also be very risky to suggest that Britain should base her policies on a position that would be the same as her affairs 100 year ago. In so doing you are an advocate of the free ride in world affairs, as far as Canadian politics are concerned. We have been told by other witnesses—and we believe they are responsible witnesses—that Canada does have an important effect on the military balance in NATO in their conventional forces; that our military forces are important to those forces and that over the past 20 years this has had a significant effect on their peacekeeping abilities in Europe. It seems to me that you jump from this position of taking no stand vis-à-vis the two great powers of the world—we are just going to say, "A plague on both your houses"—to the position of our being really effective as a third force. I do not follow your argument. You say that we would be effective but I do not see in what way we could be effective. Certainly Canadians do not agree with all of the

activities of one of the great powers in world affairs and we do not disagree with all of the activities of the other great power. But somewhere in a hostile world we have to choose up sides, and perhaps it is only the lesser of two evils, and I am speaking of this idea of becoming the third force in world affairs. I just do not follow your argument that we are going to be effective in any way and I would like you to enlarge on that.

Professor McNaught: Sir, let me take those four main points you have made in order. I am particularly sensitive to your charge of bad history, and my argument there is that it seems to me we have gone through—and most of the writing on the history of Canadian relations in world affairs tends to agree with this—a period in which we moved from relatively impotent colonial status and underdevelopment to a period where we made contributions in South Africa and in two world wars of significant military kind and became industrialized. However, we go right through that period to the point at which Melvin Conant, the defence specialist who wrote *The Polar Watch* made the very effective case that once again we are in a position of being quite impotent militarily. As far as the argument of influence on the military balance of NATO is concerned, it seems to me on looking over the evidence of this Committee when Mr. Gellner was here—and I think his information on military matters is very clear and sharp—that he would agree that the influence we have militarily is political influence and not military influence; that we buy influence politically by making a military contribution. However, the essential argument is the comparison with 100 years ago is that in the nuclear age and the missile age and the air age Canada cannot really, without crippling herself economically, make significant military contributions.

● 1140

I will now move from there to your point about the free ride. I think it is tremendously important we make quite clear that we do not believe we are defended by the United States. I for one certainly do not believe it. I feel very nervous indeed when I realize that the diametric range of the Bomarc missile is 400 miles, so it would go 200 miles north and 200 miles south, and 200 miles south of North Bay is at about Rosedale in Toronto, where it might be presumed to intercept an oncoming Russian bomber if indeed the Russians were silly enough to send bombers over at this late date. I do not think we are arguing for a free ride and I for one would argue that we should not only save that billion dollars on defence but add to it and make an honest woman of Canada in the field of external aid. We are very, very far down on the list now and I am not suggesting a free ride; it is quite the reverse. I think we ought to pay our way far more in terms of trying

positively for conciliation and the elimination of those conditions in the third world that lead to frictions and accidental war.

With respect to being neutral on the question of whether Russia is right in a given case and America is right in another case, I do not think that non-alignment implies that kind of intellectual or moral neutrality. I think there is no reason in the world why non-alignment would prevent us from speaking very forcibly against the Russian intervention in Czechoslovakia, nor would it prevent us from speaking very forcibly against the Russian intervention in Viet Nam, and both things should be done and whatever countervailing action we can take should be followed. It seems to me it is military non-alignment that is the point, and this will free us a good deal for initiatives which might cost us more money than we spend now.

Finally, as to your last point, I do not think that we have to choose sides, in other words.

Mr. Howard (Okanagan Boundary): Thank you.

The Chairman: Mr. Macquarrie?

Mr. Macquarrie: I may say that I was delighted by the definiteness of the point of view expressed in Professor McNaught's paper. As a clean living young Canadian I am a little leery about going over to the American Embassy too often or even spending too much time in the East Block!

I wonder if, in the reference in the first part of your paper to our pusillanimous attitude and our fear of offending the United States, in presenting this you gave much thought to the fact that the Canadian government in foreign policy, as in any other policy, must take note of the attitude of its people. Might it not be that for a long time there was a significant body of opinion in Canada which would look with disfavour upon this act of recognition. I discover there is still a body of opinion, and I am inclined to think it is a minority, but there still are people who feel that way. I wonder if you would be prepared to give a decent regard for our point of view in this factor?

● 1145

Professor McNaught: That last piece of phraseology tempts me to say that I do not suppose Prince Edward Islanders favour public ownership very much either! However, it seems to me that a decent regard to Canadian public opinion means testing it precisely, and one of my key arguments is that in putting forward the arguments we do in defence of our present foreign policy we are not really testing Canadian public opinion. That is to say, we tell our electorates that we are defended by the American

nuclear umbrella and by the whole NATO structure, and we tell them that as a semi-developed industrial state we cannot produce the weapons we need for our defence and thus we have to have the defence production sharing agreement. I think both those things are wrong. In fact, I do not think they are true. The point is that if we go to the Canadian people with what I would regard as the facts—and which I suspect you do not, Mr. Macquarrie—I would argue that Canadian opinion will come down on the side of non-alignment, but it depends on how the facts are presented and whether they are presented. I agree that in the present circumstances a Canadian public opinion poll would probably show support for NATO, but it would not be that overwhelming and it seems to me that those people who agree with all or some of this case, and particularly the points about the credibility gaps within our present policy, should go out and politically educate the Canadians as to the reality of the defence and foreign policy situation. It could produce a majority for non-alignment. I have a decent respect for Canadian public opinion, but because I have I think it is open to persuasion, particularly on the basis of facts.

Mr. Macquarrie: I do not think there has really been any presentation of the argument that if we do this we will offend the United States. I do not think, in all fairness, this has actually been the thrust given to the problem. I am most tremulous to suggest that I move in as a mere political scientist when talking with a leading historian, but I am wondering if over the years there has been in this country this penchant for nonalignment, if I may use that expression. Might one not say that the leaders of the state at the time of the Boer War found it very difficult to resist Canadian involvement—recalling Laurier's troubles in that regard. And I recall, too, that Borden felt there was no other choice apart from the legal situation. He felt that even the whole question of conscription was one that was forced upon him. And certainly in the world war, too. In other words, I myself would question—and that is as far as I will go because I defer to your historical knowledge—that there is anything more natural in the Canadian character which would lead us to nonalignment than to an involvement beyond our shores.

Professor McNaught: Even from the history of M. Bourassa?

Mr. Macquarrie: Bourassa was never one who carried public opinion; he carried a portion of it.

Professor McNaught: An important portion, yes.

Mr. Macquarrie: Certainly minorities are always important.

Professor McNaught: They always are.

Mr. Macquarrie: I would like to ask a couple of little questions and then I will pass.

Do you really believe, Professor, that the Soviet Union would have been restrained to any real degree in its movements against Czechoslovakia whether or not their military operation was carried out with multinational group?

Professor McNaught: I think that the diplomatic difficulties which Russia has obviously encountered during and right down to the present in the intervention in Czechoslovakia suggest very strongly that she would be deeply concerned about making that a multinational Warsaw Pact operation and might very well have thought twice about doing it unilaterally, yes.

Mr. Macquarrie: I am impressed by your point of view—I almost said "faith." There is one comment in the quotation about General Westmoreland. I cannot believe that it is not possible for any observer with half an eye to distinguish our role vis a vis the Vietnamese conflict from Australia, South Korea and so on. I thought perhaps that that was an area in which if there were time I would not have disagreed with you.

Professor McNaught: If I may take just one minute on that last point, there is of course a difference between our role and that of Australia in South Viet Nam. However anybody, as you say, with half an eye can see that we send aid only to Saigon, and that we have certainly passed along very useful information to the Americans who are observers on the ICC. Thus, that half eye, looking out of its other quarter, can see the case I am making about our alignment, I think.

● 1150

Mr. Macquarrie: I may say, Mr. Chairman, that the half-eyed observers were the people to whom the professor referred, not to himself.

The Chairman: Mr. Laniel?

Mr. Laniel: Professor, to pursue the point made by Mr. Macquarrie about the origin of our alignment, from 1899, first I do not see how you can come to that conclusion because in 1899 there was actually no conscription. It was a voluntary participation by individuals. Then you referred to the most serious of our racial crisis which has deepened steadily as our alignment and commitments deepened. I do not come at all to that conclusion. I am a Quebecker, a French-speaking Canadian, and I even get the impression that our present policy does get more support in Quebec than it does in many other parts of Canada. What do you call our racial crisis in Canada?

Professor McNaught: Well, sir, I defer to your superior knowledge of French Canadian feeling on it. I can only draw my conclusions from the historical books I have read and from looking at the contemporary press, I suppose, of French Canada.

I would defend the proposition that the intervention in South Africa, although it did not carry with it conscription, did carry a point of view in supporting the British Colonial Empire in trouble that most French Canadians found very distasteful, and that certainly conscription in two world wars did create a racial crisis in the country.

On the question of whether or not Quebec opinion is more forthright in its support of our present military alignment, it is very hard to test exactly but I would say that if one went through the issues of *Cité Libre* when they were heavily contributed to by the present Prime Minister . . .

Mr. Laniel: Read by no one though.

Professor McNaught: Read by the new guard perhaps—that one would find considerable informed expression of Quebec opinion in favour of nonalignment. I think you would find the same in *Le Devoir*.

Mr. Laniel: There are many people in Quebec, like any other province, that speak to themselves and between themselves only.

Professor McNaught: That I suppose has to be a matter of opinion in the absence of a precise opinion poll. But I would argue that even if your case were so that again, as with English-speaking Canada, the presentation of a case based on what in fact are the facts might well, if it were politically pressed, result in a majority for nonalignment.

Mr. Laniel: Would you not agree, though, that part of the problem that you referred to would be related just as much, if we complied with part of your conclusion, to the economic or sentimental relations with the Empire, from the side of French Canadians, who would look at English-speaking Canadians as sometimes forgetting Canada too much for the benefit of the Empire—and that it was only a matter of feeling and lack of communication? So I do not see exactly what our commitments or alignment have to do with that. But now it is being changed and our alignment is more with the United States. Still I am not sure that the Canadian population does come to the same conclusion that you do. Can you really give me an alternative to Canada's progress in the future, or can you tell me really if Canada would have progressed just as much as it has without being aligned.

Professor McNaught: Well this, of course, is the very centre of the argument and it is why I was suggesting that a review of foreign policy, particularly with respect to military alignment, has to be also a review of the whole range of domestic economic social policy. I am very impressed by the findings of the Watkins Report and Mr. Safarian's writing on the extent of the American ownership of Canadian industry. I am also very impressed with the way a country like Sweden can produce for itself all the military equipment it needs and that anything that it has to buy in the way of particular electronic equipment it can buy without putting all its eggs in one country's basket.

It seems to me that what we have done in fact is to allow the economic military relationship to become so intertwined that it is now possible for a man like Professor Underhill to say that in 1940 we moved out of our British century and into our American century and will inevitably have to follow the American lead. It is that kind of interpretation I am trying to contest. I, for one, do not see the inevitability that is attached to it. I, for one, think that a serious commitment to economic planning in this country could render us less dependent than Mr. Pearson suggested in his letter upon defence production-sharing agreements, and I suspect that if the political campaign were put in the right hue that Canadians would support that line of progress.

Mr. Laniel: I do come to the conclusion that your opinions or conclusions are based more on morality than anything else because we hear people, and I believe it, say that nuclear war is impossible and that the danger of war is among unstable nations. You might have different opinions than I have or get a different image, but I believe that the dangers of war exist in small emerging nations, and very often in nations that have instability and a racial crisis—and they are nonaligned countries. So how can you come to a conclusion like that.

Professor McNaught: I do not really see the relationship there. I think that certainly Canada's influence should be toward minimizing the crises and the imbalance and the insecurity of those small nonaligned and underdeveloped countries—although they are not all nonaligned. Pakistan, for example, is aligned. But the fact that they are nonaligned is not the fact which makes them unstable, nor is the fact that we are aligned make us unstable. All I am suggesting is that we can free ourselves to work in precisely those unstable areas more effectively if we accept the argument about the indefensibility of our national interests in the event of a nuclear war. I do not think any of your witnesses probably have suggested that Canada is likely to face a conventional attack.

Mr. Laniel: I will not pursue that line of questioning, Mr. Chairman.

On page 6 you refer to Czechoslovakia and compare it with the American intervention in Guatemala, the Dominican Republic and also in Cuba. How can you come to such a conclusion and then say that the Russian intervention was a direct response to what Russia considered, rightly or wrongly, a threat emanating from NATO to Czechoslovakia from the communist orbit. Would you not agree at the same time that that was done by Russia mainly because they were losing control of political Czechoslovakia?

Professor McNaught: Yes, yes, I quite agree, and that of course is why the American interventions take place in Latin America. But the diplomatic argumentation on the Russian side has been that the NATO powers, particularly West Germany, have been luring Czechoslovakia away. Indeed, the Russian argument went well beyond that and said there was heavy infiltration. If I remember correctly, immediately before the August intervention a very great deal of space was given to the NATO war games by the Russian press. As I say, rightly or wrongly—they may be wrong in the fear—but the existence of NATO serves as a very effective justification for the maintenance of the Warsaw Pact and this kind of intervention.

● 1200

Mr. Laniel: An excuse, you mean.

Professor McNaught: An excuse.

Mr. Laniel: Thank you, Mr. Chairman.

Mr. MacLean: Mr. Chairman, on page 3 there is the expression "American slaughter in Viet Nam", and at the bottom of page 7

... we have no direct treaty obligations to support American aggression ...

and so on. There seems to be a thread throughout this paper that the Professor is vitally concerned with the morality of the United States in international affairs and rightly so, but to me the academic freedom for centuries, I suppose, has been based on the premise that academics search for truth.

To me these seem to be half-truths in the sense that there is no apparent concern about the international morality of other large countries—I am thinking of China and Russia as examples—and there seems to be a lack of concern about the right of independent nations to defend themselves against world communistic infiltration and the stirring up of trouble by international communist parties throughout the world. The presumption would be that the communist world no longer practices this sort of thing; they have suddenly reformed. When would this have taken place?

Professor McNaught: That is not my assumption. Obviously the Soviet Union is prepared to act unilaterally and militarily when it feels its immediate direct interest is threatened, but so is the United States and I assumed that in talking about non-alignment I would be concerning myself principally with the countries with which we are basically aligned. I think there is, of course, a right for independent nations to defend themselves, but we could bog down here for hours on the question of whether or not South Vietnam is an independent nation and on the precise sequence of the infiltration of non-Vietnamese troops.

All I can say in defence of my academic integrity in the matter is that some time ago I came to the conclusion that in fact the only foreign troops in any numbers in Viet Nam are American and their contributing allies and that this does, in fact, constitute invasion.

Mr. MacLean: You assume thereby that there is no objection to North Vietnamese troops being in South Viet Nam.

Professor McNaught: No more objection, sir, than there would be for troops from Catalonia to be in Valencia during the Spanish civil war. I regard the Vietnamese war in exactly the same way as the late President Kennedy did, that this is a civil war and therefore one will probably expect a movement back and forward of various sections of the Vietnamese people trying to resolve their problems. It is not an international boundary and the Geneva Accord spelled that out very precisely in 1954.

● 1205

Mr. MacLean: Therefore you would have to be able to say that there were no foreign troops in any part in Viet Nam.

Professor McNaught: Except for the American troops and the Australians and the South Koreans.

Mr. MacLean: You believe that this is so?

Professor McNaught: Yes.

Mr. MacLean: On page 6 there is a statement:

But it was an action of a sort that NATO was never designed to prevent; and it was an action which, in considerable degree, the existence of NATO made likely and possible.

This concerns the Czechoslovakian affair last summer. How, then, do you account for the *coup* in Czechoslovakia in 1947 before NATO existed.

Professor McNaught: In 1947, of course, central Europe was in a good deal more turmoil than it is now. It is an interesting fact in terms of historical statistics

that the last election held in Czechoslovakia before what you call the *coup* produced a majority for the communist party which was slightly greater than the majority that Abraham Lincoln won in 1860, and which he then proceeded to enforce by force of arms which produced the biggest war of the century in North America.

These things obviously are going to happen but my point is that NATO was not designed to roll back communist power from Czechoslovakia, nor was it designed to roll back communist power in Hungary, and even in the great days of John Foster Dulles it could not be used for that purpose because it was not designed for that purpose. It was designed to protect the sphere of influence that already existed, surely.

Mr. MacLean: I do not want to go into a personal experience, but I was in Czechoslovakia just before the *coup* and I would not say that what was taking place there by any stretch of the imagination could have been called a free declaration of popular support.

On page 7 there is a statement beginning with the following words:

Certainly such a development would rob Russia of much of the rationale for maintaining the Warsaw Pact system.

This is arguable, of course. It sounds quite plausible, but thinking back a bit, what rationale did Russia have compared to the democratic countries—Britain the United States, France and so on—who, after World War II, promptly dismantled their military machines whereas Russia, on the other hand, kept hers up and maintained it almost at the strength it was during World War II and, in the process, connived at the imposition of communist control in Eastern Europe as well as gobbling up the Baltic states when there was virtually no military power of any sort in the rest of Europe? What were they afraid of?

Professor McNaught: What were the Russians afraid of?

Mr. MacLean: Yes, since NATO is the bugbear as far as they are concerned at the present time.

Professor McNaught: I am not suggesting, sir, that the only possibility of friction between Russia and the West lies in the existence of NATO. You can go back to Catherine the Great and Frederick the Great and, indeed, through the entire history of Russia and the Germanies and find an historical and cumulative fear on the part of Russians that they will be invaded by armies tramping across the Pripet Marshes and all the rest of it. That is a built-in and historical condition.

I am arguing that the existence of NATO at the moment gives an additional diplomatic advantage to the Russians in their maintenance of the Warsaw Pact

which is the principal system which they use to maintain their predominant influence over Eastern Europe. Certainly I would not argue that all causes of friction or fear by Russia of Germany would be removed by the removal of NATO. What I am suggesting is that the removal of NATO will reduce friction and will reduce the diplomatic reasons and justification for the Warsaw Pact.

● 1210

Mr. MacLean: What about the other side of the coin, the fear of European countries of Russia?

Professor McNaught: Of course, they are there but again, as I have said I do not believe, nor have I ever seen it argued, except by the late Senator McCarthy, that NATO is designed to roll back communism in Eastern Europe.

Mr. MacLean: No, I am not suggesting that, but it was created and designed, I would submit, to stop the communistic flood across Europe which started with Czechoslovakia.

Professor McNaught: This clearly is a matter of difference of view and I think I come down on the side of George Kennan, and the revisionist history that has been going on and the review of atomic diplomacy, that in fact—and I hesitate to quote, because it is not attributable, a very highly placed person in recent Canadian diplomatic service—it is arguable whether or not there was a Russian military threat against Western Europe beyond Czechoslovakia at any time.

Mr. MacLean: This is likely true. The communist is in the position where he uses other methods which democratic countries do not usually use to subvert the legally constituted governments of other countries.

I have one further question. On page 10 with regard to military deserters from the United States, are you suggesting that these people are all legitimate immigrants who intend to cast their lot irrevocably with Canada and to remain here for the rest of their lives as Canadian citizens, as was the case with Sir Clifford Sifton's men in the sheepskin coats that you referred to?

Professor McNaught: There are two points there. I might say just very briefly on your point that democratic governments do not normally use methods of subverting foreign governments that are commonly used by the Russians, I doubt very much whether the Russians have an organization that is any more efficient than the CIA.

Second, on the question of deserters, it seems to me that it is traditionally and properly not our job

to inquire about their military status and I do not think that we have ever seriously concerned ourselves about a kind of immigrant's pact with God that he will never leave Canada once he comes here.

On the personal level, I can only say that I have a number of draft dodgers and deserters who are both colleagues and graduate students. My own impression is, particularly as I looked over the applications as I did a week or so ago for Canada Council scholarship grants, that draft evaders and draft dodgers are going to turn out to be one of the most invigorating streams of immigration that we have ever had in this country.

Mr. MacLean: Your point of view on this does not surprise me at all, but I think a country surely has a right to assess the purpose of someone coming into the country is to determine whether they are coming as visitors, landed immigrants, or with the purpose of becoming citizens eventually—permanent residents. I will pass now. I have taken up too much time.

The Chairman: Mr. Groos and then Mr. Lewis.

Mr. Groos: Doctor, to put it mildly, I take it you do not place much value on Canada's taking part in mutual defence alliances such as NATO.

Professor McNaught: Yes, sir.

Mr. Groos: Would you agree that a viable defensive alliance is, perhaps, a prerequisite to negotiating a general disarmament, arguing that it is better to negotiate from a position of joint strength rather than divided weakness?

● 1215

Professor McNaught: That is, of course, an argument that is always put forward in defence of the present NATO arrangements and it is one that I might well have added to the argument about containing West Germany: that in fact you cannot negotiate disarmament and security in Western Europe without matching the Warsaw with the NATO arrangements.

My own feeling, I must confess, is that since the Second World War the history of disarmament conferences—the progress towards disarmament, the progress even towards limiting the spread of the nuclear weapon—has been not only nil but retrogressive and has been based on the growth and extension of the military alliance system. My conclusion is that the military alliance system does not lead us very rapidly towards disarmament.

I think when you couple that with what I consider to be the fact of the case that Canada cannot in any

case contribute militarily anything of substance, we have a political responsibility—I will not use the word “moral” if possible—to experiment and to initiate along the other line. You can call it unilateral disarmament if you like. It is a pejorative term—it is not a pejorative term to me, but it will be if it comes up in the press.

I think that Canada, conceding not that she is defended by the United States as many people argued as isolationists in the nineteen-twenties, but conceding that there is not any defence in a military sense should use this as an area of experiment and say: “We do not believe that we are defended. We believe that we are made more vulnerable and more likely to be attacked and we are not going to commit ourselves to any part in the arms race, whether it be by supplying Portugal or the American army in Viet Nam or by even putting Bomarcas at North Bay and La Macaza; that we, in fact, believe the road to serious progress towards disarmament is along the path of creating mutual confidence and the reduction of friction in any way that we can find open to us.”

Mr. Groos: I am not prepared to agree with your assertion that Canada has nothing to offer to NATO by remaining within the Alliance because I think that she has—I will not use the word “morally” either—but let us come a little closer to home and argue the case the other way.

You say that we have nothing to gain by remaining within the Alliance. May I suggest to you that perhaps we have something to lose from the point of view of the security of our people by removing ourselves from the Alliance, or certainly some sort of an alliance with the United States? I noticed yesterday in a paper—and I am speaking personally now—that the United States apparently intends to instal one of what I think are 14 light ABM sites on Bainbridge Island, which happens to be north of Seattle and Tacoma and in the close vicinity of Vancouver and Victoria.

It seems to me that influence on the site of the anti-ballistic missiles is a matter of very practical importance to the people in the Victoria and Vancouver areas and I think it would be a matter of very practical and urgent importance to the people who live pretty well anywhere along the northern United States boundary. I include people who live in Winnipeg, Toronto and Montreal. Does it not necessitate some sort of alliance so that you can at least be talking to one another about these sort of things and discussing the position of these sites?

● 1220

Professor McNaught: I agree that there are areas of risk here and I would place the argument basically on the question of balancing the risks. It seems to

me that we are not going to prevent the Americans, whether we are inside or outside of a military alliance with them, from placing any of those ABM sites virtually wherever they want, whether it is outside Detroit, and thus endangering Windsor, or wherever it may be. I do not think they are going to imperil what they consider to be the effectiveness of their system merely because we do not want it too close to Vancouver. I really cannot see the strength of the argument that if we are inside the Alliance we are likely to gain that.

Mr. Groos: As someone who was formerly mixed up in this sort of thing, I disagree with you entirely. I think if it is to our joint advantage to have these moved somewhere else—if we can show that it is to our joint advantage—the Americans will be very quick to respond.

Professor McNaught: I would like to say just one further thing to your argument. Your basic assumption, of course, is that the emplacement of anti-ballistic missile systems can be considered somehow, if it is done rightly, to be to our joint advantage and, of course, really that is the basic point at which we disagree.

I do not, in fact, agree that even with the ABM thin system—or whatever the Americans call it now—we are enhancing our defence. You have heard a lot of evidence so far from people from the Hudson Institute and others about that, and when you are talking about saving 8 million people or 18 million, if you are going to kill 40, 50, 60, or 70 million I really cannot see much point in talking about the relative advantages.

Mr. Groos: To return to this point, since you returned to it yourself, I was arguing it from the other point of view, that whereas you may not be able to do much to enhance your own safety from the point of view of oncoming missiles without diminishing such safety as you are about to have, you could certainly diminish your safety from your own fallout or the fallout of the destruction of the oncoming missile by moving these elsewhere. Would that not appeal to you, not to have the fallout over Toronto or Montreal?

Professor McNaught: We are already going to have it over Toronto from the Bomarcas. You see, it is a question of what one's estimate is of what is going to happen in the event of a nuclear war because there is not going to be any fallout unless there is a nuclear attack, and despite the variations in Herman Kahn's War Games and the rest of it, I do not feel that anybody, in fact, is likely to survive in any populous Canadian centre if there is a nuclear attack and this again, I suppose, is basically where we would differ.

Mr. Groos: Thank you.

The Chairman: Do you have a supplementary, Mr. Gibson?

Mr. Gibson: Do you not feel that you are attributing complete bad faith to the United States, considering Canadian defence interests as well as their own, in taking that position?

Professor McNaught: No, I am not really. What I am saying is that I do not believe that it is our defence interest that is being considered. I believe that the faith is perfectly good faith with the people who presumably are doing that planning; people who will trust a Canadian deputy commander of NORAD at Colorado are acting in good faith. Certainly it is not a question of good faith; it is a question of the interpretation of the reality of the situation. I just do not believe that gives us defence no matter how good the faith is.

The Chairman: Mr. Lewis?

Mr. Lewis: Professor McNaught, as you know, even though I cannot accept your final conclusion my position is closer to yours than that of other members of the Committee. It seems to me that there are some elements in your argument that ought to be investigated a little more closely.

● 1225

Is it realistic to speak of the Warsaw Pact as the same kind of alliance as the NATO pact? Is the Warsaw Pact, in fact, much more than a piece of window dressing for a military system with headquarters in Moscow which existed before the Warsaw Pact was nominally created and which would exist tomorrow if the Warsaw Pact were officially dismantled?

Is it not also a fact that when you are talking about the Warsaw Pact, because of what I have just said—if it is valid and I think it is—you cannot be talking about any member of the Warsaw Pact withdrawing. The invasion of Czechoslovakia last August is the latest example, but you did not really need any example. Yugoslavia is the one country that succeeded and it succeeded probably because it came so soon after the first rape of Czechoslovakia and before the eastern situation hardened to the extent that it has since.

One knew perfectly well that if any member of the Warsaw Pact tried to withdraw from that military—it is not really an alliance—tie-up aside from any formal alliance they would be invaded, they would be stopped, whereas I think it is still true to say despite the criticisms of American policy which you make in your paper and with which I almost entirely agree, it

is still true to say that if any member of NATO withdrew—Canada, Denmark or any other member—it would be able to withdraw. If NATO were abolished tomorrow you would have a genuine dismantling of an alliance. Therefore, the two cannot be argued about in the same sense at all. Is that not true?

Professor McNaught: I agree with your analysis so far as it suggests that the Warsaw Pact is considerably different in kind from NATO. As you suggest, it is far more a diplomatic window dressing for a military containment system but we have heard it argued, and argued strongly, that one of the two principal reasons for maintaining NATO is to contain Germany, and indeed that is the argument I have heard put most frequently and persuasively when talking, at least in private, to members of the Department of External Affairs. It is an argument in terms of good faith that I think they hold in good faith but with which I think I disagree.

I think what you are presupposing in talking about the permanence of the Warsaw Pact, whether or not NATO disbanded, is no change in the foreseeable future anywhere in Eastern Europe. I think obviously there have been signs of considerable change, considerable liberalization, from time to time and while it is true that just such a change was suppressed militarily by Russia, it does not follow that it always will be. A suppression of the level of insecurity, fear, and the rest of it, the tension in Western Europe, might well lead to a reduction in Russia's feeling of need to maintain a purely military containment.

So far as a NATO member's withdrawing from the pact in Western Europe is concerned, if she just withdrew militarily you are probably right that nothing would happen, but if she withdrew—let us take Italy as a hypothetical example—to become a communist state I for one would not bet that there would be no intervention.

Mr. Lewis: Well, perhaps I agree with you on the latter. I do not read present day history as presenting that kind of likelihood in Italy or France where the Communist parties are the strongest at the moment. And I do not agree with the proposition that NATO is valuable in containing West Germany. I was not in Parliament at the time, but I happen to be one who opposed the rearming of Germany in the first place.

But that is irrelevant, is it not, Professor McNaught, to the present situation, and you have taken me to the second point that I want to discuss with you for a moment.

• 1230

Is not Germany the real problem in Europe at the moment? If one talks about spheres of influence

and ignores Germany and the very explosive situation that that divided country presents to Europe it seems to me that one is not reading modern history adequately.

I am not impressed by the suggestion Mr. MacLean made about Russia gobbling up the Baltic states. I have a memory that we agreed to that gobbling up. I forget whether it was the Potsdam or the Yalta Treaty, but we said: "You go ahead and gobble them up," and we signed a treaty to that effect.

All of that is history, and one can criticize it, but the fact remains that you have (a) a divided Germany, (b) a divided Berlin and (c) a situation in which there is still no peace treaty in Europe.

The fact also remains that you have a determination on the part of the eastern European nations, the Soviet Union and all its allies, or satellites, whichever you like, to keep Germany divided unless it can come under Communist control; and the United States, Britain and France and their allies, or satellites, if you like, determined to keep Germany divided unless it not be a Communist state.

In that constantly boiling situation, with threats and counter-threats about Berlin, stuck in the middle of the Soviet zone, surely it is not unreasonable to expect that the western nations of Europe, aware of that situation and contiguous to the immediate dangers, would feel a pressure on them to have a military alliance, or some kind of alliance, to protect themselves. Any worry about the situation, and I am sharing with you a concern rather than a finished opinion, is that although I think it is true that the Soviet Union is not interested in going west of Czechoslovakia, excluding Germany, it is not at all true, I suggest to you, that the Soviet Union and its allies are not interested in going at some point into the rest of Germany—certainly ejecting the western presence in Berlin, which is a crazy situation, anyhow, and eventually going beyond that.

This is the kind of situation in which it seems to me that to condemn the western European Nations in NATO, whatever Canada's role may be, and to condemn them for taking this NATO step in 1948 and hanging on to it since, does not have very great validity in the present situation.

I am sorry to have taken so long, but I wanted to explain fully what was concerning me.

Professor McNaught: To take your last point first, I have not condemned them for taking the step in 1948 or 1949. It seems to me that the tension of the world was understandable then, even though there was still a monopoly of "the bomb" in American hands.

It seems to me that to defend NATO as a military alliance which offers precarious security to Norway,

Denmark and France—and France does not seem to think that it offers very much—is to skirt around the very subject that concerns you most and lies at the centre of it, and that is the condition of Germany.

I was talking the other night with Professor Smith, who is publishing a book on East Germany and is an American authority on it—regarded of course, by our student radicals as a lackey in the pay of the defense department—who argued, persuasively to me at any rate, that one of the effective things Canada could do if she got out of NATO would be to negotiate for the recognition of East Germany.

I think I would agree entirely with that, that the problem, as in many other areas, is to recognize the realities of the situation. Germany is divided; Germany has not always been united historically; and it is now again clearly, permanently and substantially divided. A realistic foreign policy surely would take account of this and in so doing might well lead other states to a similar position.

• 1235

Mr. Lewis: If I may interrupt you, I think that might make sense to me if it were not for Berlin. How do you solve that? Do you recognize East Germany and retain Berlin as a separate enclave inside East Germany?

Professor McNaught: It seems to me that one of the problems in resolving the Berlin situation, which we should never have had in the first place, is to find some kind of diplomatic leverage by which to force real bargaining on the subject. Such a leverage might well be the question of the recognition of East Germany. But I do not see how we can recognize East Germany and stay in NATO.

Mr. Lewis: No, we cannot do that. That is pretty obvious.

That is all, Mr. Chairman.

The Chairman: Mr. Cafik, and then Mr. Harkness.

Mr. Cafik: Professor McNaught, on page 3 and continuing into page 4 there are a number of comments about which I would like to speak for a moment.

On page 3 you say:

The biggest of the credibility gaps, and there are many, in our foreign-defence policies is that between our generally conceded knowledge that there is no defence in a nuclear war and our support of an alliance system founded on a dominant nuclear power.

Then you go on, and the same theme appears on the following page, where you say:

... we should revoke a policy of military alignment which is defended on the basis of a myth.

I presume the myth you are talking of is the non-defensibility of a country. Then farther on in the same paragraph you say:

... we should say plainly that there is *no* defence. . .

It seems to be quite clear that you are stating that there is no way that we can defend ourselves.

Professor McNaught: Against the only kind of invasion or attack that is foreseeable, yes.

Mr. Cafik: All right. It is one argument to say that there is no way that any nation can adequately defend itself in the event of a nuclear war, but that is surely altogether different from saying that there is nothing that a country can do to prevent the occurrence of a nuclear war?

Professor McNaught: Right.

Mr. Cafik: If a country wanted to avoid the occurrence of a nuclear war, realizing that a nuclear war is one that everyone would lose if anyone went into it—that there is no way of defending it—if a country believed that then surely it would be quite consistent with that belief for that country to feel that it could best prevent a war by military alliance and a position of strength. Would you agree with that?

Professor McNaught: Yes.

Mr. Cafik: I have the impression upon reading this paper, that you are creating a myth in the sense that saying to the Canadian people, "There is no way you can defend yourself in a nuclear war", you create the impression—or I am afraid many people get it—that there is nothing we can do; that we just have to sit back and accept it—accept this unhealthy reality.

I think quite the contrary is true and that Canada can do something. I, personally, at the moment, from anything I have heard, am inclined to feel that the best way to prevent the awful possibility of a nuclear war is to participate in alliances that would make it impossible, and certainly not worth while, for a nuclear power to begin one. What have you to say about that?

Professor McNaught: Let us take that last point first. The two presidents preceding the present one in the United States are both on record as saying that the gravest danger of nuclear war that we face is that of accident. So also are Mr. Wilson and Mr. Khrushchev on record. If I had the references I am sure I could find the present leaders of Russia agreeing with that position. I find it difficult not to agree with them.

Mr. Cafik: Yes.

Professor McNaught: Therefore, to build up alliances based upon this kind of incredibly intricate electronic system of devices and controls, in which you say you have a balance of terror—and which is not a balance because the United States says we have to maintain our superiority—is not credible, because within that system all of the leaders of the great powers say that there is a real danger of accident and that that is the way in which nuclear war will come. In fact, Mr. Kennedy went even further and said there could probably be a mathematical formula by which you could predict when it would come.

Mr. Cafik: In view of this, what is the solution? Do you suggest that all countries on this side of the sort of war of nerves, on the west, should unilaterally disarm and disband their associations with one another for mutual defence?

● 1240

Professor McNaught: I agree with you that we find ourselves in a kind of Greek tragedy. As I said previously, I am not questioning the good faith of most of the people who construct and maintain the system, but I am saying that because we can contribute nothing substantial to it, and because all the other methods of containing it and rolling it back as a potential end-of-the-world system have failed within the military-alliance approach, we owe it to the world to strike out on a different line. I am not saying that only the countries in the west should do it. I am talking of the country we can influence.

Mr. Cafik: I find a little inconsistency there. You say we should get out of NATO because we do not contribute anything to it. I would regard your argument as more consistent with your approach if you thought we should get out of it because we did contribute something to it.

Professor McNaught: You are quite right. When I put it that way there is an apparent disconnection there. I agree with you that we should get out of it if we did contribute something to it, yes.

Mr. Cafik: So that is not an argument. The amount of contribution is not germane to your argument.

Professor McNaught: It is in the sense that I reject that as a counter-argument. If it is said to us, as to anyone who supports non-alignment that we have to stay in because we contribute an important element to NATO, I say that is not in fact an argument. We do not, but even if we did we should get out.

Mr. Cafik: Then what is the argument for getting out? Do you feel that these military alliances such as

NATO and NORAD, discounting Canada's participation in them at the moment, have any material effect in eliminating, or decreasing, the possibility of a nuclear war?

Professor McNaught: On the basis of the fact that the alliance system, on our analysis of it and its history, seems to be (a) self-perpetuating and (b) mushrooming in its effect, when you relate very contemporary recent history to the history of the alliance system—say, prior to World War I—and the fact that the alliance system leads, by its own internal generating power and the condition of its armament race,—which still goes on—to increasing the likelihood of war, it seems to me that the argument is that the alliance system will lead us to war and that this is one of the principal reasons for working against its continuance.

Mr. Cafik: Then you think that not only should Canada withdraw from NATO but that NATO should be disbanded?

Professor McNaught: It is probably not up to Canadians to argue that case, but to take their own action and proceed on the assumption that actions do, in fact, speak louder than words. In other words, I think that an image and an initiative are what we should be pursuing and not a cloud of verbiage on what other people should do.

Mr. Cafik: I gather you are a historian. From an historical standpoint, bearing in mind that since World War II roughly 50 wars have been fought in the world and that none of them has really been in Europe, or has affected the real European theatre, would you conclude that that proved that NATO was not a deterrent to war, or perhaps that it was? Or would you not draw any conclusion?

Professor McNaught: I do not think it is necessary to draw definite conclusions from that, no. I think that it is quite clear that the fiftieth, if that is the exact number . . .

Mr. Cafik: I think it is a little more than that.

Professor McNaught: . . . of wars beyond Europe —certainly a number of those wars have been closely related to the competition of the existing alliance systems of Europe and America. The Korean war would certainly be an example. The Vietnamese war is clearly an example. As to whether or not NATO has prevented war in Europe, it seems to me you cannot make that conclusion just because wars so far have happened outside Europe.

● 1245

In other words, if NATO had not existed, there would still have been within the context of nuclear

armaments a reluctance to face a conflict in Europe which, by the very nature of the Continent and its population, could not be contained, whereas the peripheral wars more easily can be contained.

Mr. Cafik: I do not think I agree with your view but I will pursue another line of questioning. Also on page 4 you say:

but an image of concern which reflects the real beliefs of the Canadian people . . .

I gather you have the impression—and this was pursued a little earlier—that the Canadian public are inclined to favour a non-alignment policy. You had stated that one time, and I find later you give arguments as to why they do not really favour it—because we have not given them the facts, as you call them. I do not know how you can have your cake and eat it; that they are in favour of it but we are misleading them and that is why they are not.

Professor McNaught: Historians are notable for having their cake and eating it, I am afraid, and I will agree with you that I am assuming a knowledge about what the Canadian people want there that is not historically verifiable. That is true. It is my assumption, however, that if the case were put on the kind of ground that I consider to be realistic, then one would have a majority of the Canadian public opinion behind it.

Mr. Cafik: It seems to me that in that argument that you put forward, what you would consider the facts would really be begging the question. In other words, you would expect to say to a group of people—Canadians: "NATO serves no useful purpose; I want you to believe this. I want you to believe that it does not help defend us, it does not in any way deter us from entering into a war; therefore what do you think about it?" I think they are obviously going to vote a particular way if they believe the premise you laid down. So I think you would have the same problem if you presented all your facts to the Canadian people as you see them; I think that they would have the same reason to suspect that they may not have made a valid judgment because the factors may not be right as they were presented to them.

Professor McNaught: I agree it is a political problem at that point, and I am assuming that in presenting the case—and you are hearing all kinds of cases presented to this Committee—just as with Mr. Gellner or General Foulkes, who may wish to substantiate and bolster the present line of policy, it is open to us to try to change it.

Mr. Cafik: Right. On page 5 you say here—and I have always been disturbed about this. We have heard people indicating the same thing.

Professor Eayrs has already demonstrated to this committee that a billion dollars could be pared from our defence budget . . .

I have been a member of this Committee since the 28th Parliament began and I have never really seen any proof that there would be any paring of a billion dollars. I gather that our defence budget is roughly \$1.7 billion and I suppose that it could be argued that we could pare the whole \$1.7 billion. I mean it is quite simple to cut everything off. But I have not seen any evidence that you can pare down that much if you believe that we need any kind of defence at all. And that brings up the next question. Do you feel that we would need any defence if we took a neutral role as you outline, or a non-aligned role?

Professor McNaught: The argument, as I recall it from reading sections of the brief presented by Professor Eayrs and also the chapter in his book on contemporary Canada, which is a very good and commendable chapter, is that \$700 million would be enough to maintain the kind of paramilitary security forces that we would need. Yes.

Mr. Cafik: And you think that these military forces would be strictly on this continent, in Canada, to defend our coast lines and our northern frontiers?

Professor McNaught: And to some extent, available no doubt as very highly trained technical people to specialized UN essentially police missions.

Mr. Cafik: You must feel, then, that Sweden and Switzerland, which are not aligned, spend too much on defence, do you?

Professor McNaught: I would argue essentially yes.

Mr. Cafik: They do?

Professor McNaught: Yes.

Mr. Cafik: You feel, in other words, that we should just pray and hope that all our neighbours, the Americans, the aggressors and this sort of thing will just sort of sit back and leave us alone. You just hope that everything will go well.

• 1250

Professor McNaught: We only have one neighbour unless one takes the polar projection. . .

Mr. Cafik: That is the area apparently in which there is the greatest danger. In the northern section, I understand from evidence we have heard, there is perhaps real reason why we should have sufficient

reconnaissance force to look after that area and ensure that it is not in fact being annexed by other powers.

Professor McNaught: The kind of reconnaissance force that I have heard suggested for the northern reaches and which you would need, based on the argument that the Americans do not accept the sector theory of geography and that the Russians may use floating icefields and the rest of it, is roughly the same kind that you have to police the fisheries, is it not?

In other words, if the Americans decide to move in there they will move in there; and if the Russians decide to move in there they will move in there. And I have yet to hear any persuasive arguments advanced by our Department of National Defence since they abandoned their plans for defence against the United States that there is very much we could do about it.

Mr. Cafik: Thank you. I had a number of other questions but I think I should leave them.

The Chairman: Mr. Harkness, then Mr. Ryan.

Mr. Harkness: Professor, would you agree that your paper here really is a statement of the pacifist position and constitutes an argument that Canada should take a pacifist stance in international defence policy?

Professor McNaught: Well, sir, pacifism is a difficult thing to define. Woodrow Wilson has been called a pacifist by his principal biographer, and yet he conducted a fairly substantial military operation abroad and in Mexico. I would not define the position that I am putting forward as a pacifist stand because I think "pacifist" has to have a fairly precise meaning and that means a person who is never willing to fight.

Mr. Harkness: Would you agree then that you are putting forward the position of disarmament or more or less complete disarmament?

Professor McNaught: Yes.

Mr. Harkness: As a historian looking at the situation between the two great wars, does it not give you some cause for concern that the pacifist feeling that existed during that period, particularly in the United States and Great Britain, and as a result the disarmament of those two countries, was a very strong reason for—in fact perhaps the only basic reason why the Second World War broke out?

Professor McNaught: Yes, I think I would agree that, in other words, Professor Underhill was wrong then

and he is wrong now. That is to say—I say that with great respect; he is my mentor in some ways—that it was wrong to not prepare, to not make an alliance with Russia when we should have made an alliance with Russia to prevent the Nazi explosion and we should have contributed more to that alliance militarily than in fact we did. My argument, however, is that the entire nature of war has changed. We now are involved with a weapons system which has revolutionised the whole concept of the use of power in the world and in such a way that the kind of contribution which we could have made effectively in the twenties and thirties is no longer open to us.

Mr. Harkness: But would you not agree that the basic situation still exists that disarmament on the part of a considerable number of nations invites aggression from those which are armed? In other words, we get back to a large extent to what Mr. Cafik was talking about when he brought up this statement of yours that there is no defence in a nuclear war and therefore you should do nothing about it. Is it not a fact that the real defence against a nuclear war, as Mr. Cafik pointed out, is the deterrent power of both nuclear and conventional armies? This is the greatest guarantee, in fact the only guarantee we have against such a war taking place.

Professor McNaught: Well, of course, I disagree with that proposition. I do not regard it as a guarantee. I believe that it is open, and progressively open, to accident or electronic failure. I do not accept most of the arguments put forward about feeling safe, not in the ultimate sense. I do not see it as a guarantee at all, and I do see a very substantial movement towards disarmament as a far greater guarantee which will certainly have to be undertaken in the context of increasing UN police activity in the minor areas.

● 1255

Mr. Harkness: Do you really believe that if the western countries got rid of their nuclear arms and got rid of their conventional arms we would not almost immediately have the situation where the Communist bloc would use their arms in order to, we will say, take over the entire world?

Professor McNaught: Well, sir, I have not suggested that we should say to the United States, "Destroy all your weapons." What I have said is that the limited area in which Canada can in any circumstances have real influence is not along the line of contributing to an armaments race; it is along the line of saying convincingly to other people, "Do not join it." The problem is limitation and we are not going to solve that problem by supporting an alliance-based arms race.

Mr. Harkness: All I can say on that is that I disagree completely with you. I think your position in this regard is not borne out by actual experience. It is certainly not by my experience and I have had considerable with regard to these matters. I think the exact reverse is the case. The fact that we do belong to these alliances, the fact that we do maintain a certain degree of armament and make a certain contribution to the security of the western world puts us in a very much better position to have some influence on world affairs and have some influence on the general action which is taken by the alliances we belong to on the whole than would be the case if we withdrew from them.

Professor McNaught: I agree that is the point of difference, sir.

Mr. Harkness: Quite a few of the statements that you make throughout here I think are subject—I will put it in this way. Would you agree that they represent your point of view and that there are a large number of other people who are knowledgeable in these matters who would take the directly opposite point of view?

Professor McNaught: I find that almost certainly and always to be the case, yes.

Mr. Harkness: I will just mention one or two of these. You say:

...as we review our role in the International Control Commission in Vietnam it becomes more and more clear that we accepted the job principally because the United States thought we would be the best representative of the West—that we would be a patsy for the Americans.

This is directly contrary to all my knowledge in regard to this matter which, I would humbly submit, is perhaps a little more intimate than yours from a practical point of view. What evidence have you that that statement is correct?

Professor McNaught: The evidence, it seems to me, is that it was the United States that suggested we should join the Commission. The evidence also is in various places in *Hansard*, where Senator Martin, who was then External Affairs Minister said as he was directly countering the argument that we were neutral on the ICC—no, I believe it was in answer to questions put to him by Mr. Lewis a couple of years ago. He said, "No, we are not. We are there as the western member of the ICC." I take that as fairly substantial evidence that that is what we were.

Mr. Harkness: That is a very different thing, though, than saying that we were there principally because the United States thought we should be and that we are a

patsy for the Americans. Actually when the Commission was set up, as you will probably remember, we accepted the job as the result of a request at the Geneva Conference in regard to the matter, and we accepted, as far as I am aware, not with any idea of representing the United States on it but of representing the western world generally on it. Poland was to represent the eastern world generally on it and India was supposed to be there as a non-alliance member of it. In no sense whatever, to my knowledge, were we to be there representing the United States and particularly to be a patsy for the United States. I take the greatest objection to this statement that we would be a patsy for the Americans.

Professor McNaught: The word perhaps is unduly offensive. If you would like me to change it to "agent" or "representative" or something of that sort, I would be perfectly agreeable. It is there for a little extra point, Mr. Chairman, and I think it is a matter of interpretation.

● 1300

Mr. Harkness: I think my point there would be that we were the representative of the western world.

Professor McNaught: In the same way that Poland was of the eastern world?

Mr. Harkness: On the whole. Poland was there representing the Communist bloc, yes.

Professor McNaught: And who lays down policy for the Communist bloc.

Mr. Harkness: This comes back to the very matter that Mr. Lewis was mentioning, that there is an essential and very great difference between the Communist bloc and the western world.

Professor McNaught: But I would argue in this case, sir, that the essential difference is that where the Communist nations may feel themselves compelled to toe the line, Canada, in all too many cases, has self-imposed upon Canadian policy a support of the American position, and the evidence for that I think is clear and spread right across our foreign policy. I agree it is self-imposed.

The Chairman: That is an advantage, Professor.

Professor McNaught: It is an advantage if you recognize that self-imposition can be revoked.

Mr. Harkness: Also, I think it is a matter of each country in the Western World looking first, as it must do, to what its own best interests are. And our best interests, in my view, are served by continuing in the alliance, in these alliances.

On page 6 you say:

Does Canada really believe that West Germany is restrained from military adventures or from acquiring nuclear weapons simply because of the presence of NATO troops in Germany? Certainly West Germany puts no more faith in America's willingness to defend her by nuclear retaliation against Russia than does de Gaulle.

I would suggest that this is a statement which is just contrary to fact. Having had considerable dealings with the Minister of Defence of Germany, and having talked to their External Affairs Minister at considerable length on these subjects, I am personally completely convinced that Germany puts her security almost entirely in the fact that America is going to be willing to defend her. She looks upon the presence on German soil of a large number of American troops armed with nuclear weapons as her more or less complete guarantee, that in the event of a Communist attack on Germany, the Americans will participate in her defence.

Professor McNaught: Sir, that is certainly a point of sharp disagreement. It seems to me that a very strong case could be made that NATO provides, in some ways, a convenient defence for the West German Government to resist right-wing demands in Germany for a much more aggressive foreign policy. I would agree that far. But I do not find it at all convincing that the fact that there are as many thousands of American troops on German soil as there are, in any way adds to the credibility of a policy of the United States of repulsing an attack on West Germany by nuclear weapons.

Mr. Harkness: Then you would assume that in the event of an attack the Americans would just, we will say, abandon their troops that are there? This to me is inconceivable.

Professor McNaught: They are, of course, armed with strategic or tactical nuclear weapons which have a larger explosive blast than the Hiroshima bomb. If there is going to be a nuclear defence, they are going to be destroyed anyway. It seems to me that they are there as a very real kind of hostage, but one which cannot be reclaimed by the use of nuclear weapons.

In other words, it is, in fact, the same kind of mythology that we are led to accept, that there is a defence against that kind of attack. It seems to me that they are buying political influence in the same way that we attempt to buy political influence from the United States by staying in the military alliance.

• 1305

Mr. Harkness: Yes, this is your point of view. But you put forward in your paper here that the Germans

essentially have this point of view, that the Germans do not believe that the presence of these American forces there means that America is going to be willing to defend Germany by nuclear means, which I think is completely wrong, and which I am sure the Germans think is completely wrong.

Professor McNaught: There is a very great debate in Germany on it, and once again one is making hypothetical assumptions about the broad tenor of public opinion, and I do not think it can be tested perfectly on a factual basis. But certainly the unrest in Germany at the moment would suggest that there is a credibility gap there of rather large proportions.

The Chairman: Gentlemen, we still have several members who wish to ask questions, and unfortunately Professor McNaught can not be back this afternoon. So if you agree, we will continue until we complete the list of questioners.

Before calling the next questioner, would the Committee agree to print Professor McNaught's advance presentation as an appendix to this day's *Minutes of Proceedings and Evidence*? Agreed.

Some hon. Members: Agreed.

The Chairman: Secondly, on February 5th Mr. Forrestall requested there be made available a list of all bilateral defence agreements in force between Canada and other states. Apparently there are 64 in all. A large majority are with the United States. Nine are with other NATO states, and 9 are with non-NATO states. All the agreements are of a highly technical nature. The Clerk has copies of the list available for any member who wants one immediately, but perhaps it would be helpful if we could print the list as an appendix to today's proceedings. Would that be agreed?

Some hon. Members: Agreed.

Mr. Roberts: Mr. Chairman, along the same lines, could the letter from which Professor McNaught quoted in his brief be appended too?

Professor McNaught: You mean the whole letter from the Department of Immigration?

Mr. Roberts: Yes.

The Chairman: It is a question of whether there is any objection on your part, Professor.

Professor McNaught: There is no objection on my part. I hope there is not on the part of the Department, since I have a copy of the letter if you would like to use it.

Mr. Roberts: I would like to have a copy of the whole thing.

The Chairman: Would you like to check with the Department before authorizing its printing, or do you feel it is necessary, Professor?

Professor McNaught: It is an official letter, so I cannot see that there would be any objection.

The Chairman: Is it agreed that this should be printed as an appendix?

Some hon. Members: Agreed.

The Chairman: Mr. Ryan?

Mr. Ryan: Thank you, Mr. Chairman. Professor McNaught, I was going to question you about the very paragraph on page 6 about which Mr. Harkness just finished questioning you. I was objecting to your dogmatic statement, I thought, that:

Certainly West Germany puts no more faith in America's willingness to defend her by nuclear retaliation against Russia than does de Gaulle.

You put this as if it were a fact. I would support Mr. Harkness in what he has to say from my experience on the North Atlantic Assembly, the consultative assembly connected with the NATO Alliance over a period of the last three years. I would say that any West German representative to whom I spoke in the course of that time was extremely nervous about any suggestion of a withdrawal by American or Canadian forces from the continent for the very reason that their presence there and their strength there lent credibility to the willingness of the North American continent to go to war, if need be, in their defence.

That is not a question, that is a statement on my part, Professor, but I thought I should support Mr. Harkness on it.

My first question. Would you not agree that every one of the 15 members of the NATO Alliance has lived, for the last 20 years, in relative peace and security within its own boundaries, and that this is some kind of a world record, particularly for these touchy times?

• 1310

Professor McNaught: Relative peace and security would, of course, perhaps exclude Greece and Turkey and possibly, in terms of peace, Portugal.

Mr. Ryan: No, they have not been invaded. I said within their boundaries.

Professor McNaught: Within their boundaries, yes. But they have had engagements between themselves; certainly Greece and Turkey have.

Mr. Ryan: Do you not think that some of Greece's troubles have been due to Communist infiltration, and also in the Portuguese colonies of Mozambique and Angola?

Professor McNaught: There is no question at all that unrest and political turbulence have been influenced by Communist feelings, yes.

Mr. Ryan: Yes. On page 5 of your written submission you dealt with Professor Eayrs' suggestion about diverting a billion dollars from our military budget to other aims. At the bottom of the middle paragraph you say, and I quote:

the same billion dollars spent on weaponry and personnel which in no way affect the military power of the alliance

Now this is what I find to be a bit incredible, that our contribution to the alliance in no way affects its military power. Are you aware, Professor, that our air division is one of the top divisions professionally manned?

Professor McNaught: Yes I am.

Mr. Ryan: Are you aware that these are probably tops in their profession, that they have nuclear and conventional weaponry that contributes approximately 10 per cent of the air strength in Europe, that our armoured brigade is one of the finest there is in the world, that we are no longer doing with 100,000 men what we can do with 9,000 or 10,000 men? This is a strong firm commitment from Canada, and I would take issue with you when you say there is no military power contribution from Canada in this respect.

Also we have the NATO naval program in the Atlantic, and I understand that this is a far greater contribution than the public generally know about. It has been run down considerably in the last while, but if the true facts were known, that naval force of ours has much to offer to the military strength of the NATO Alliance. Having said that, what would your reaction be to what I have had to say?

Professor McNaught: I am completely persuaded by the analysis of the relationship of Canadian military potential to the general power of the alliance which has been made not only by Melvin Conant, but also by Professor Eayrs, more recently. Professor Eayrs' point, as I recall it, is that while nobody detracts from the skill and training of the air division and the rest of it in West Germany, it is considerably over and above the strike power required and assessed as required by NATO commanders. And the more general point that Conant insists on, is that in this age we cannot, because of our size, contribute enough to make a significant military difference.

In saying that our contribution in no way affects the military power of the alliance, that does not mean that it contains no power itself. Of course the brigade group and the CF-104s contain power, particularly with their nuclear tactical weapons. But the point is that they do not affect in an essential way the over-all military power of NATO. Certainly they do not affect it to the extent that NATO, as it is conceived, would be crippled by their withdrawal, or seriously affected by their withdrawal.

Mr. Ryan: On page 7 in the third line from the top, you say, quote:

If Canada were to declare for non-alignment, and the results was a virtual disbanding of NATO, it is perfectly reasonable to argue that she would be decreasing rather than increasing tensions in Europe.

• 1315

It is the term "perfectly" that I am getting at. I think I am quarrelling more with your overstatement or overemphasis than anything else. And in this connection I would like to say something about my view of the current situation in Western Europe and in the Atlantic.

The Soviet fleet—now the second in the world in power—is patrolling from Norway through to Iceland and beyond. It has a four-fifth dominance in the Baltic. It has the Island of Bornholm, the Danish Island, as a hostage, with 100,000 people on it. The Soviet army is sitting on the German plain, in East Germany, with about 20 divisions. It is now a spearhead in Czechoslovakia. The Soviet fleet is passing through the Bosphorus, the Dardanelles. It is in great strength, about 50 units. It is based in Syria and in Egypt, and soon apparently it is to be based at the very new modern facility in Algiers. There is some word to the effect that it is even being refueled in Yugoslavia.

There is also the withdrawal of the whole British military influence in the Middle East and the Far East and there will be a big vacuum there which the Russian fleet is also attempting to fill by coming around through Far East waters at the moment because Suez is closed. With all these prongs like a pitchfork into Western Europe, do you think really that now is the time for us to withdraw from NATO, to hit it really between the eyes, as it were, and to permit this large Russian military build-up to be in a position to take on the Western European allies one at a time?

Professor McNaught: Your assumption underlying this, of course, is that there is a Russian conspiracy to attack us, that it is based on a general intention

of aggression and takeover. I do not see that that is any more valid an assumption than it is to say that the American power is aggressive and maintains fleets in all the places you have mentioned and, indeed, intervenes farther from her borders than as yet Russia has done in strength. The real thrust of your argument is that in some way Canada can contribute significantly to what is, I quite agree with you, a power confrontation all around the world. I think Canada cannot effectively contribute to that and that we should work in every possible way with the money that we would save, which otherwise would be uselessly spent on a military contribution, to eliminate points of tension at which this vast confrontation at any point could blow up.

Mr. Ryan: You would break up this successful unity that has endured for all these years in order to accomplish what?

Professor McNaught: Just what I have said. If one says "successful unity for all these years" one has also to understand, of course, the changing environment during those years and the development of world-devastating weapons which it seems to me does, in fact, go well beyond the older concepts of gunboat diplomacy or even vast land armies fighting from trench to trench in Europe. It is a revolutionary new situation and so infinitely expensive that the real power confrontation cannot be affected by us. Our effect has to be on a non-military line.

Mr. Ryan: Of course, I quite agree that the nuclear confrontation is one thing but it is more the conventional confrontation in Western Europe that I fear will cause a blowup.

• 1320

Professor McNaught: Let me put one question by way of illustration. When we had the missile crisis in Cuba in 1962 there was the confrontation of two branches of conventional weaponry by the two super-powers, by Russia trying to get ordinary ships into Cuba and the President of the United States imposing an embargo, but fortunately the confrontation did not move beyond into shooting. But there is mounting evidence, and certainly we all felt it at the time, that the real danger behind that conventional confrontation was nuclear weapons, and I would argue to you that the confrontation of the conventional forces of either of the super powers will always involve that danger of nuclear weapons.

Mr. Ryan: As a historian, Professor, has Russia not had a history of expanding from time to time, retreating somewhat, but always keeping within its maw other tribes, other nationalities, other nations and that this has been a constantly growing process down through the last hundreds of years, so that now there are very few Russians left in Russia, proportionately?

Professor McNaught: Yes, that is quite true. One of the most significant American historians, Frederick Jackson Turner, however, rewrote the entire history of the United States in terms of expansion and I think you really do not want me to take the Committee's time to tick off, one by one, the wars of expansion of the United States. I agree they are both very large continental, militarily expansive powers, yes.

Mr. Ryan: Most of the Americans came in by lawful immigration methods, not by taking.

Professor McNaught: I do not think the Mexicans would agree with you, sir.

Mr. Ryan: Well, in some barren areas this would be true.

Professor McNaught: Nor would the Filipino's.

Mr. Ryan: But in respect of Russia, there is this sort of recognized theory of the pebble in the pond, that she has been rippling out and she needs to be contained.

Professor McNaught: You have invited me to comment on it as a historian. I can only refer you to the now vast literature of American expansionism from the foundation of the Republic. It was Captain Mahan in the eighteen-nineties who spelled out the whole virtually imperial theory on which American power has grown and enveloped a very great deal of the world.

Mr. Ryan: Are you suggesting seriously that there is an analogy to be drawn between the satellites under Moscow and the satellites under Washington?

Professor McNaught: I am suggesting seriously that the Vietnamese people probably think exactly that.

Mr. Ryan: A couple of weeks ago, I was in Saigon for a couple of days and I did not find that to be the case at all. In fact, the Americans are starting to secure that country completely. They are going to have trouble along the border so long as the Russians are in there helping the Combodians and the Laotians and the North Vietnamese.

Professor McNaught: Yes, certainly there is the confrontation, but the Americans are in fact there and doing . . .

Mr. Ryan: The South Vietnamese government and the Americans are starting to win the people over in the south. That is what I found. I was only there for a short few days. I know I am no oracle but it certainly looked to me as if perhaps now is not the time to settle that war.

Professor McNaught: Well, I sincerely hope you are right.

The Chairman: Mr. Gillespie, do you have a question?

Mr. Gillespie: Thank you, Mr. Chairman. I did not have the advantage, I am afraid, of hearing Professor McNaught deliver his paper but I have been listening intently and I would like to put a couple of questions to you, Professor McNaught.

A moment ago you referred to the two super powers as being militarily expansive powers, I think probably this is the basic assumption that one has to recognize in thinking about the world order and the kind of balance of power that we might look for in the world. It seems to me that we can only secure the peace of the world based on some appreciation of this idea of balance of power, related to both capability and intention.

You seemed to say at one point—I do not know whether I understood you correctly or not—that you were against all forms of alliances and that you would promote the disbandment of NATO because you felt that this would help to ease tensions throughout the world. Did I read you correctly?

● 1325

Professor McNaught: The essential point I was trying to make is that I think NATO has, in fact, restricted Canadian foreign policy initiatives and that therefore we should withdraw from it. The possible confirmative point that we should then urge the disbandment of NATO is not one that I would make as a formal proposition.

Mr. Gillespie: Did you not make the proposition during the hearings this morning that it would be advantageous if NATO, as one of the military alliances within the world, were to disband?

Professor McNaught: It is my feeling that this would promote a reduction of tension, yes.

Mr. Gillespie: Then are you arguing the case for the withdrawal of Canadian forces from NATO as part of this particular objective; that is, the dissolution of NATO?

Professor McNaught: I am arguing the essential point first that we should have freedom of initiative for our own foreign and defence policy and the subsidiary argument that our best method of influencing other people is to take an action of that sort rather than by simply persuading them verbally.

Mr. Gillespie: Surely you would have to go back to the basic assumption that you are making about the kind of world order within which we have to make our policy. The kind of world order that you seem to be foreseeing is one that would be better preserved if there were no military alliances.

Professor McNaught: Yes.

Mr. Gillespie: You start from that position and then you follow through and say we should get rid of NATO and then you follow through logically and say Canada should withdraw from NATO because this will help to bring NATO down.

Professor McNaught: You are moving. . .

Mr. Gillespie: You can see the argument from one point and I am turning it on you and saying that it has to be related to the kind of goals and the kind of world order within which you foresee Canadian policy being made.

Professor McNaught: I quite agree. I think in return for this kind of policy one should bargain for concessions in Berlin, the settlement of the German question. Certainly it should not be done as a merely naive and isolated unrelated kind of action. But I say that to anticipate the disbanding of NATO as it presently exists is to offer ourselves a flexibility of approach and initiative that we do not have within it.

Mr. Gillespie: But thinking again in terms of the world order argument, is it not more likely that the balance of power, the stability, the predictability of actions of others will be better preserved around an alliance system?

Professor McNaught: That, of course. . .

Mr. Gillespie: I am not now arguing Canada's position. I am arguing the alliance system which you were arguing also earlier, I think.

Professor McNaught: I think the history of alliances is such as to give me no confidence whatsoever in their ability to preserve world order, but precisely the reverse, and the history of Schmidt and Bernstein and others of the alliance structure that led to the first World War, which was very similar in nature to the alliance structure that has grown up today, is such as to persuade me that they lead to arms races, they lead to fear, they lead to militarism and they lead, in fact, to all those things that threaten stability rather than create it.

Mr. Gillespie: So long as there is certainty about the response, they do not need to do the very things that you have been talking about, and surely this is one of the things that NATO has provided—the certainty of response.

Professor McNaught: May I give you one quick historical illustration? In 1911 and 1912 Sir Winston Churchill at the Admiralty had Sir Eyre Crowe draw up a plan of naval action and of rapid deployment of British military forces to France in the event of a breakdown, and he said in the Crowe Memorandum that this was a system of massive and instant and known retaliation which would make certain that there would be no attack upon France. I do not really see the certainty of retaliation; that was, in fact, disbelieved by Germany and I think there is exactly the same kind of credibility gap today between the alliance systems.

● 1330

Mr. Gillespie: I would have thought that might have happened if Cuba had gone the other way. I suggest to you the very fact that the United States were prepared to meet the threat of Cuba and to risk the world holocaust at that time has increased the credibility of NATO and the certainty of response.

Professor McNaught: I take, I am afraid, a different point of view about what happened in Cuba. It seems to be borne out by everything fresh we learn about it, including Robert Kennedy's latest publication, that essentially in the last analysis, since the United States did in fact commit an act of war in imposing an embargo on Cuba, the peace of the world depended upon the good sense of Mr. Khrushchev in not trying to overcome that embargo.

In other words, there was a credibility gap both ways there and I do not think that the fear of instant retaliation was such that it prevented President Kennedy at that time from undertaking an act of war.

Mr. Gillespie: Would you agree that the whole history of these alliances and the reason they have broken down is because there has been uncertainty about the resolve within the alliances to back up the alliance when the crunch comes.

It seems to me, anything we may do inadvertently or as a matter of policy which tends to weaken the idea that NATO will respond, depreciates the value of NATO as a factor in maintaining the balance of power.

Professor McNaught: I disagree. It seems to me the more complex and massive the system of the alliance becomes the more dangerous it becomes. One historical example you will recall is the crisis over the shooting of the Archduke at Sarajevo in 1914 when certain members of the various alliances began to make preparations against the possibility that there would be war. One of the preparations made, of course, was the sending by the Czar of very large numbers of troops to the border. The difficulty was

that by accident and rather bad planning they bunched up at the border and some of them had to go across it because there was a jam at the railhead. It was that event, prominently, amongst other things, which induced the Kaiser to move fast.

In other words, I think that the massive organizations of alliance structures—and the technological changes involved today do not necessarily change the inner psychology of the alliance system—are themselves propellents towards war and accident.

Mr. Gillespie: Thank you, Mr. Chairman.

The Chairman: Professor McNaught, in yesterday's newspaper I believe there was a story to the effect that the Russian government was in favour of Canada withdrawing from NATO. Most of Canada's traditional friends are in NATO. If Canada were to withdraw from NATO, how, in your view, could it do so without causing concern and anguish to its friends, and without giving aid and comfort to the Russian government? One of the arguments used in favour of our continuing in NATO is that, if we were to withdraw, it would give aid and comfort to the Russian government and distress our friends.

Professor McNaught: You may think I have skated on thin ice already; this is going to be really thin, but I believe the case I am going to put. What distresses me about the way in which you have put the question is the assumption that we have friends and we have enemies.

The Chairman: I avoided using the term "enemies".

● 1335

Professor McNaught: However, the counterpart of friend is enemy and while it is true that some of our traditional friends are in NATO, so are some of our traditional enemies. An enemy today is not necessarily an enemy tomorrow and *vice versa*. One of the real problems we face, a problem which all of us who have lived through the cold war should recognize, is that the existence of an alliance system itself tends toward that very cast of mind of dividing the world into friends and enemies, and thus of reducing the flexibility of responses to individuals inside the

other camp. This is precisely one of the areas in which Canada has been most restricted by her military alliance membership.

I am obviously not going to take the step to say we should regard Russia as a friend, but I think we should certainly not take the step and automatically say that Russia is an enemy.

The Chairman: If Canada were to consider entering a state of neutrality, do you think there is any possibility at all that the U.S.S.R. and the U.S. would recognize Canadian neutrality? In your view do you think there is any possibility that Russia and the United States would recognize Canada as being in a state of neutrality in view of its geographical position?

Professor McNaught: The recognition of neutrality, of course, is a complicated problem in international law. I have not proposed that we should try and get for ourselves a scrap of paper such as the Belgians have relied on since the 1830s with an international guarantee of neutrality, but rather that we should not align ourselves positively and militarily which, as I say, creates the division of the world psychologically, politically and the rest of it. My answer is that probably they would both recognize that neutrality if we wanted them to, although I would not advocate it.

The Chairman: Why would you not advocate it?

Professor McNaught: I cannot see any particular end to be served by advocating it. To advocate a formal neutrality of the Belgian, Swiss or Swedish type, it seems to me, while it would not be a serious restriction on your flexibility of foreign policy, it would be an unnecessary restriction on it. Everybody knows that the Swedes and the Swiss do, in fact, have restrictions on their foreign policy which flow directly from their formal neutrality.

The Chairman: Thank you very much, Professor McNaught. Are there any other questions?

On your behalf, I would like to thank Professor McNaught for being with us this morning. I know we found it very interesting and I hope you found it interesting as well, Professor McNaught.

Professor McNaught: I have indeed. Thank you, very much.

APPENDIX II

Kenneth McNaught

NON-ALIGNMENT FOR CANADA

For a long time many people have argued that our membership in the NATO-NORAD military alliance system has acted as a break against serious Canadian diplomatic initiatives, especially if those initiatives would clearly offend the United States. Amongst the stock illustrations in support of this argument was the case of our non-recognition of China and our pusillanimity on the question of Chinese membership in the United Nations. Now that we have begun to negotiate the matter of recognition directly with the Chinese I do not doubt that the proponents of alliance loyalty will point to the Stockholm talks as proof that the alliance is really broad and tolerant and doesn't inhibit us at all. Because of its plausibility I should deal with this very current argument first.

The point about an initiative is that it is something that comes first, that it is something consciously designed to give a lead. Now, while one can only applaud the decision finally to make "honest women" of our wheat dealers one can hardly argue that with forty embassies established in Peking, including those of France and Sweden, and with substantial evidence that Italy is about to follow suit, we are taking a daring initiative. Indeed, to the skeptical eye of an historian who is painfully aware of the revised interpretations of events required from time to time as archives are belatedly opened to researchers, the whole picture lacks perspective. And even before the archives are open a little reflection can add perspective. For years we have listened to those who have been close to the East Block indicate, both implicitly and explicitly, that the reason we did not recognize China was that to do so would unnecessarily offend the United States. Again, as we review our role in the International Control Commission in Vietnam it becomes more and more clear that we accepted the job principally because the United States thought we would be the best representative of the West—that we would be a patsy for the Americans. In this context of occasions on which we have run interference (or information) for Washington our current approach to Peking—as an initiative—is unconvincing. Through the grisly years of escalating horror in Vietnam we served Washington on the ICC, we steadfastly boycotted Peking at the diplomatic level, and we even endorsed the American theory of intervention in Vietnam. Undoubtedly we practised quiet diplomacy and even intimated publicly that it would be useful to stop the bombing. Like Catherine the Great, during the eighteenth century partitions of Poland, we wept but we kept on keeping on.

What, then, is the context of our decision to negotiate the recognition of China? We do so in the environment created by acute political crisis in the United States. That crisis resulted directly from the insistent need to end the war in Vietnam. And any permanent settlement in Southeast Asia can scarcely be arranged if the United States continues its demand to maintain the faltering diplomatic ostracism of China. Thus, while Mr. McCloskey clucks disapprovingly in Washington, no one in Ottawa takes this as a serious signal to stop the play. Perhaps, but not necessarily, it would be too much to speculate that we had been quietly invited to make our move now. But certainly it would be too much to suggest that the move was a bold assertion of independence and proved that alliance membership does not inhibit us from pursuing policies strongly disapproved by the senior member.

Apart from the China question there remain in full force all the other illustrations of how our military alignment leads to inactivity on many worthwhile fronts and, at the same time, humiliates the Canadian people by associating them closely with some of the most detestable action in the contemporary world. From Greek repression to Portuguese imperialism to American slaughter in Vietnam—we are directly tied by the alliance system. Equally, by that system, we have prevented ourselves from exercising a freedom of action at the United Nations and on other fronts that might well have contributed to a reduction of international tensions. By loyally supporting the American claim that their nuclear superiority must be sustained if there is to be a "balance" of terror we have directly contributed to the continuing "imbalance" and to the proliferation of nuclear weapons. By declaring before the world that we believe we are defended by the American nuclear forces (and thus must concede their strategic demands) we have emasculated our support of a non-proliferation treaty. For how can we say to Israel, or India, or Egypt or anyone else that *they* should forswear nuclear weapons when at the same time we claim to bask in the protection of those very weapons—and add that they are absolutely essential to our security?

The biggest of the credibility gaps, and there are many, in our foreign-defence policies is that between our generally conceded knowledge that there *is* no defence in a nuclear war and our support of an alliance system founded on a dominant nuclear power. Since

we know, moreover, that we would be attacked only in the event of war involving the United States and as a result of American policy differences with another nuclear power, the double logic of the situation dictates strict military non-alignment. In a very real sense the nuclear age has recreated for Canada a situation surprisingly similar to that in which our militia bills of the 1860's were debated. At that time everyone agreed that the only danger of attack lay in a breakdown of relations between Britain and the United States—and that the chief burden of defence would therefore be upon Britain. The main difference a hundred years later is that our protector could not protect us. I think it is a safe bet that, had Macdonald and Cartier disbelieved the power of Britain to defend us, Dominion status would have been achieved with more despatch than was in fact the case.

But the real point is, following from the above reflections, that we should revoke a policy of military alignment which is defended on the basis of a myth. In so doing we should not argue that withdrawal from the military alliances system results from our belief that the United States has to defend us willy-nilly; we should say plainly that there is *no* defence, there is only appalling danger that civilization will be annihilated if all states do not come to realize the facts. We should use our non-alignment quite consciously as an international image; not an image of aloof neutralism but an image of concern which reflects the real beliefs of the Canadian people rather than the tired, pre-nuclear age shibboleths of 'power'.

A modern policy of non-alignment might well draw sustenance from the non-military policy bases of our early Confederation years. In that period the governments not only knew that Canada could not afford to contribute anything of significance to the military defence of the empire, they also acted on the knowledge. The principal argument they advanced to London, in reply to *kreigsverein* suggestions was that our best contribution was the development of the country and the peaceful working out of the implications of our multi-national life. While it is true that on occasion someone like Sir Charles Tupper would argue that the building of the CPR was in fact a direct contribution to the military strength of the Empire, few Canadians took that argument seriously—and even fewer Englishmen. Only the rather suspicious Captain Mahan, prefiguring the patterns of American imperialism from the lessons of British sea power, thought that the CPR posed a threat to America. Our military non-alignment in such crises as that which enveloped General Gordon in the Soudan, left us free to develop the ways and sinews of peace. When, quite unnecessarily, we decided to align ourselves militarily with the Empire in 1899 in South Africa, we brought about one of the most serious of our racial crises. And it was a crisis which deepened steadily as our alignment and commitment deepened. Surely the lesson to be learned is that in periods when the military expenditures

which we can afford are insufficient to affect in any significant way the international 'balance of power' we are best advised to put all our effort into proving that a multi-racial state in the modern world can survive without atomizing itself and can develop a cultural life as rich, or richer, than that which can be afforded by nations which devote preposterous proportions of their national incomes to doomsday weapons.

Professor Eayrs has already demonstrated to this committee that a billion dollars could be pared from our defence budget without impairing our ability to provide the kind of para-military forces which we should, as a non-aligned state, have ready for UN police-supervisory actions. If these savings were spent on the alleviation of poverty and the enrichment of culture in Canada, and on extensions of our foreign aid programme it would take a courageous man to argue that they would not do more for the peace of the world, and for even a narrowly-conceived Canadian national interest, than the same billion dollars spent on weaponry and personnel which in no way affect the military power of the alliance.

But the argument for continuing our tight military alignment through NATO and NORAD and the defence production sharing agreement is far more complicated than the relatively superficial one of securing military defence. It is, however, no more convincing than the straight defence argument. That we buy influence at Washington is a part of the further argument for alignment that, again, Professor Eayrs has critically examined. In fact what we buy is inhibitions and defence contracts. An argument advanced less volubly, but of great influence amongst members of the Department of External Affairs, is that a strong NATO is the only sure means of keeping a chain on West Germany's territorial ambitions and any demand she might put forth to acquire her own nuclear weapons. And West German nervousness, it is argued, has justifiably increased because of Russia's intervention in Czechoslovakia. The argument is barely plausible, especially when it includes the proposition that the Soviet intervention renewed the military threat against western Europe. That intervention was a direct response to what Russia considered, rightly or wrongly, a threat emanating from NATO to detach Czechoslovakia from the Communist orbit. It was no different in kind from American intervention in Guatemala or the Dominican Republic or, abortively, in Cuba. That is, it was a reprehensible military action to preserve a sphere of influence. But it was an action of a sort that NATO was never designed to prevent; and it was an action which, in considerable degree, the existence of NATO made likely and possible. NATO, in short, is the principal justification for the Warsaw Pact. And without the Warsaw Pact cover the Russian action would have been diplomatically next to impossible.

Does Canada really believe that West Germany is restrained from military adventures or from acquiring nuclear weapons simply because of the presence of NATO troops in Germany? Certainly West Germany puts no more faith in America's willingness to defend her by nuclear retaliation against Russia than does De Gaulle. And as far as conventional defence against a conventional cross-border aggression is concerned West Germany is certainly capable of assembling sufficient force against any assault that was of less size than that which would invite total (and therefore nuclear) conflagration in Europe. Were Canada to disengage herself from NATO, in the opinion of many observers, including at least one who is high in the present government, some other NATO members would probably follow suit. The fear is that all that would be left would be West Germany and the United States. Yet this is the essential relationship in NATO in any event. If Canada were to declare for non-alignment, and the result was a virtual disbanding of NATO, it is perfectly reasonable to argue that she would be decreasing rather than increasing tensions in Europe. Certainly such a development would rob Russia of much of the rationale for maintaining the Warsaw Pact system. And, beyond doubt, the options open to Canada in her relationship to central and eastern Europe would be sharply increased. She might even lapse into realism by recognizing the permanent division of the Germanies.

The opportunities for constructive and peace-promoting initiatives that non-alignment would open up are, in fact, so numerous that the real question is not "should we get out?" but "why do we stay in?" The question should really be debated on exactly the same grounds as the question "should we join OAS?" If the debate were put on this basis the answer would probably be the same in both cases—the disadvantages far outweigh the advantages. And in both cases the disadvantages (although even stronger in the case of NATO) cluster around the inhibitions imposed by membership. I think the inhibitions imposed by our military alignment are so numerous and, often, so subtle that they deserve further specific illustrations. For, in fact, they constitute a positive argument for non-alignment.

Canada has on many occasions expressed sympathy for the plight of the Vietnamese nation but we have sent aid only to the southern part of that nation. As a result we were listed by General Westmoreland as one of America's supporting allies—and how else but in that light can other states see us? The point is that even in an area where we have no direct treaty obligations to support American aggression we consider that our basic military alignment dictates such support. And when, after more than two full years of massive escalation of the war, Canadian public opinion showed a growing uneasiness, we got a clear statement of why we had to play ball. The statement came in a letter from former Prime Minister Pearson. It was his

reply to 360 professors who had sought Canada's open repudiation of the intervention in Vietnam and a halt to the export of Canadian war material destined for use in Vietnam. Mr. Pearson wrote: (March, 1967)

Confidential and quiet arguments by a responsible government are usually more effective than public ones.... Too many public declarations and disclosures run the risk of complicating matters for those concerned.... The more complex and dangerous the problem, the greater is the need for calm and deliberate diplomacy.

Well, the quiet diplomacy presumably continued through 1967 and 1968 with no noticeable effect—except, perhaps, to weaken the position of Mr. Ronning. What did lead to some progress towards a negotiated peace was the political breakdown in the United States itself. Can anyone deny that Canada's only real avenue of influence in these circumstances would have been along the lines proposed in the professors' letter—a kind of action that certainly would not have delayed the American political crisis and which would probably have hastened it?

While our quiet and ineffectual briefs were being trundled along the corridors of power in Washington a more effective section of our external relations machinery was in top form. The Canadian Commercial Corporation pushed ever higher our share in the profits of the war—up towards \$400,000,000 a year in *direct* contracting. And here we find the really solid reason for not rocking the North American boat. It is a reason which was elaborated in Mr. Pearson's letter. After reviewing the extent to which defence production has been integrated, and the technological and mass production advantages we receive as a result, he argued that because of these developments we could not in fact refuse to contribute to the American war effort in Vietnam:

For a broad range of reasons, therefore, it is clear that the imposition of an embargo on the export of military equipment to the USA, and concomitant termination of the Production Sharing Agreements, would have far-reaching consequences which no Canadian government could contemplate with equanimity. It would be interpreted as a notice of withdrawal on our part from continental defence and even from the collective defence arrangements of the Atlantic Alliance.

Perhaps this is the line of reasoning which has induced the defence minister to propose, during the present policy review, that our arms spending should be increased rather than decreased. No more concise or authoritative statement has yet appeared than that contained in Mr. Pearson's letter. After it, who can maintain that acceptance of continental integration in defence production and planning leaves us free in general foreign policy; and who can deny that our NATO-NORAD membership dictates our foreign

policy? The military alliance is the outward and visible sign of our inward and very material ecstasy.

No doubt the political implications of the situation as stated by Mr. Pearson do not engender equanimity in government circles. Withdrawal from continental defence planning and production would require a good deal of political footwork and even more hard economic planning. But that in itself is not an argument for not pulling out into the open the real reasons (and results) of our military alignment. If the purpose of the present policy review is *really* to consider all the implications of our present alignment then it will have to examine and publicize a very wide range of our domestic policies that are directly affected. In many cases, from foreign investment to immigration, the real meaning of our policies is not only determined by our military alignment but is also almost totally unknown to the public. I propose to mention one area in which the alignment influence is direct and, at the same time, largely obscured from view.

Most Canadians feel that our immigration policy should reflect our basic liberalism. They believe that, not unlike the United States, Canada has been an asylum for millions of people from the British Isles and Europe. They believe, too, that it is a mark both of our independence and our liberalism that we instruct our immigration officials not to enforce foreign laws or to snoop into the political beliefs or military obligations of intending immigrants. Had we acted otherwise a good many of Sir Clifford Sifton's "men in sheepskin coats" would have been sent back to fight in the imperial armies of Russia and Austria-Hungary. Thus, when young American war-protestors began to seek asylum in Canada and many of them experienced difficulty in being admitted there was considerable public concern and the Department of Immigration instructed its border officials to adhere to the regulations by not asking questions about military status. At the same time, however, the Department made a quiet reservation. There was a difference between draft-resisters and deserters. Thus it continues to, in effect, enforce American law by rejecting deserters from the American army. And it does so as policy, although most Canadians undoubtedly assume that if an American refuses to fight in Vietnam and deserts when he is ordered overseas, he will not on that account be denied entry to Canada.

When, in the spring of 1967, I asked the Department on what grounds it pursued this policy I was told, at first, that it was an obligation arising from our NATO commitment. When I objected that the commitment was nowhere spelled out I was informed that it stemmed from the NATO Visiting Forces Act. When I argued further that this did not apply to deserters the

point was conceded and I received an official letter* which cleared up the point. I will quote from the letter because it is the only way of illustrating fully the point I am developing:

It is quite true that the NATO Visiting Forces Act is applicable only to foreign military personnel actually on service in Canada, and that consequently a foreign soldier who comes to Canada after deserting somewhere else is not subject to its provisions. I am sure you will agree, however, that neither Canada nor any other member of NATO would be acting in the spirit of the North Atlantic Treaty if it granted immunity within its borders to deserters from the military forces of other members of the Alliance.

Well, I agree that the admission of American deserters to Canada is contrary to the spirit of NATO. That is just the point. Moreover, the further reasoning behind the Departmental position is equally unnerving:

The doctrine of 'asylum' is not recognized in the Canadian Immigration Act, or in any other Canadian statute to the best of my knowledge. In any event, common usage suggests that it really has no application to citizens of friendly countries, particularly those having democratic forms of government similar in principle to our own. The connotation surely is that a person seeking 'asylum' aims to escape from political persecution by a regime having totally different standards from ours. A deserter from the American Forces, or from those of most other NATO members, is certainly not in danger of political persecution, though he may well be faced with prosecution.

I don't think I need to specify those parts of the above passage that should cause deep concern to Canadian liberal opinion, or to underline the relationship of the policy to our military alignment. The letter goes on to suggest very clearly that the avoidance of service in Vietnam is a legitimate concern of our immigration officers, since, to avoid military responsibilities is tantamount to total irresponsibility:

Personal qualities are of major significance in reaching a decision on this point, and motivation is one of the qualities to be taken into account. A person who comes here because he believes it to be a good country to live in, and one that offers him better opportunities, is more likely—other things being equal—to make the transition successfully than is a man whose chief motive is to avoid responsibilities in his own country. Accordingly, there have to be rather special circumstances before we accept an applicant seeking to escape

*Department of Manpower and Immigration, Office of Director and Assistant Deputy Minister (Immigration); File No. 555-38; July 31, 1967.

from his creditors, his wife, or some other legal obligation under the laws of his own country. I think you will agree that, under the Immigration Act, we have to look at military deserters in this general category.

It is often argued that, if we really *want* to take an independent line in our foreign relations we could do so, like De Gaulle, without formally rejecting military alignment. I have tried to show that the complexity of our alliance commitments, both known and unknown, is such that independence is unlikely within the alliance system. But what of the further argument that, since we are so timid within the alliance system we would probably be no bolder if we merely withdrew formally from the system? This is a strong argument. One answer is that if, as a result of the present review, we decide upon military non-alignment, that decision will rest upon a political debate that must go far beyond the walls of the West Block. It would be a debate concerning almost every substantive issue in Canadian domestic and foreign policy. And, if it produced a majority for non-alignment, it would also have produced a majority which would demand extensive public planning of investment, resources development, cultural growth and the production of the limited range of conventional armaments that we would still require. In no other way than by closely examining the total implications of our military alignment can we really define the true interests of the country or discover the extent to which Canadians are willing to pursue those interests.

APPENDIX JJ

February 6, 1969.

List of Bilateral Defence Agreement
Between Canada and Other Countries*Belgium*

1953, March 30—General Agreement between Canada and Belgium concerning the transit through and stationing in Belgium of Canadian forces.

France

1962, May 25—Exchange of notes between Canada and France for the exchange of defence science information.

Federal Republic of Germany

1959, Aug. 3—Agreement between Canada and the Federal Republic of Germany on the settlement of disputes arising out of direct procurement.

1964, Aug. 28—Exchange of notes between the Government of Canada and the Government of the Federal Republic of Germany concerning the exchange of information relating to defence science (with a memorandum of understanding).

Ghana

1962, Jan. 8—Technical assistance agreement on military training between the Government of Canada and the Government of the Republic of Ghana.

Greece

1962, July 18—Exchange of notes between Canada and Greece concerning the exchange of defence science information (together with a Memorandum of Understanding).

India

1953, June 12—Exchange of notes between Canada and India constituting an agreement regarding the inspection of supplies and equipment purchased in Canada by India.

Italy

1961, Dec. 18—Agreement between the Government of Canada and the Government of the Republic of Italy concerning the sale in Italy of waste material and scrap belonging to the command of the RCAF in Italy.

1963, Sept. 18—Supplementary agreement to the agreement between the Government of Canada and the Government of Italy concerning the sale of waste material and scrap belonging to the RCAF signed in Rome December 18, 1961.

Jamaica

1965, July 16—Exchange of notes between the Government of Canada and the Government of Jamaica concerning the training of Jamaican military personnel by the Canadian forces in Canada.

Korea

1958, Dec. 18—Utilities claims settlement agreement between the Government of the U.S.A. as unified command and on its own behalf and on behalf of certain other governments, and the Government of the Republic of Korea.

Malaysia

1966, Apr. 22—Agreement between the Government of Canada and the Government of Malaysia concerning the provision of military transport aircraft to Malaysia.

Nigeria

1963, July 3—Agreement between Canada and Nigeria governing the training in Canada of military personnel from Nigeria.

1964, June 25—Agreement between the Government of Canada and the Government of the Federal Republic of Nigeria regarding the terms and conditions of service of Canadian Armed Forces personnel on secondment to the Nigerian Armed Forces.

Norway

1960, May 24—Exchange of notes between Canada and Norway concerning the organization of the "Canada-Norway Defence Science Information Exchange Project".

Tanzania

1965, Nov. 4—Agreement between the Government of Canada and the Government of the United Republic of Tanzania concerning the provision of military training and advisory assistance.

1966, Apr. 30—Agreement between the Government of Canada and the Government of the United Republic of Tanzania concerning the provision of military transport and liaison aircraft to Tanzania.

United Kingdom

1964, Sept. 11—Exchange of notes between the Government of Canada and the Government of the United Kingdom concerning the status of Canadian forces in Bermuda.

United States of America

1940, Aug. 18—Declaration by the Prime Minister of Canada and the President of the U.S.A. regarding the establishment of a permanent joint board on defence (Known as the Ogdensburg Declaration).

1941, Mar. 27—Agreement between U.K. and U.S.A. relating to the bases leased to the U.S.A.

1941, Mar. 27—Protocol between Canada, U.K. and U.S.A. concerning the defence of Newfoundland.

1941, Apr. 20—Declaration by the Prime Minister of Canada and the President of the U.S.A. regarding co-operation for war production made on April 20, 1941 (and related documents).

1944, June 27—Exchange of notes between Canada and U.S.A. relating to payment for certain defence installations in Canada and at Goose Bay, Labrador.

1947, Feb. 12—Joint statement by Canada and U.S.A. concerning defence cooperation between the two countries. (Permanent Joint Board of Defence to continue collaboration for security purposes).

1947, Oct. 23—Exchange of notes between U.S.A. and U.K. relating to the delimitation of the area within territorial waters adjacent to the leased naval base at Argentia, Newfoundland. (With Annex).

1949, April 12—Exchange of notes between Canada and the U.S.A. regarding the establishment of a joint industrial mobilization committee.

1950, Oct. 26—Exchange of notes between Canada and U.S.A. giving formal effect to the "Statement of Principles for Economic Cooperation".

1951, Aug. 1—Exchange of notes between Canada and the U.S.A. regarding the extension and coordination of the Continental Radar Defence System. (Pine Tree).

1952, March 19—Exchange of notes between Canada and the U.S.A. confirming the recommendation of March 28-30, 1950 made by the permanent Joint Board on Defence concerning leased bases in Newfoundland.

1952, Apr. 30—Exchange of notes between Canada and the U.S.A. relating to the application of the NATO status of forces agreement of June 19, 1951 to the U.S. Forces in Canada including those at the leased bases in Newfoundland and at Goose Bay, Labrador.

1952, Nov. 8—Exchange of notes between Canada and U.S.A. for the establishment of United States global communications facilities in Newfoundland.

1952, Dec. 5—Exchange of notes between Canada and U.S.A. regarding the leasing of certain lands situated within RCAF Station Goose Bay (Newfoundland).

1953, June 30—Exchange of notes between Canada and U.S.A. regarding the transfer to Canada of the three Loran stations at Port-aux-Basques, Battle Harbour and Bonavista in Newfoundland.

1953, June 30—Exchange of notes between Canada and U.S.A. concerning the installation of an oil pipeline from Haines to Fairbanks, Alaska.

1954, May 3—Exchange of notes between Canada and U.S.A. concerning the construction and operation of a Loran Station at Cape Christian, Baffin Island (together with annex).

1955, May 5—Exchange of notes between Canada and U.S.A. governing the establishment of a distant early warning system in Canadian territory (Dew Line).

1955, June 13—Exchange of notes between Canada and U.S.A. governing the establishment and operation by the United States Air Force of Gap Filler Radar stations in the Newfoundland-Labrador area.

1955, June 15(1)—Agreement between the governments of Canada and U.S.A. for cooperation regarding atomic information for mutual defence purposes.

1955, June 15(2)—Exchange of notes between Canada and U.S.A. governing the establishment and operation by the United States Air Force of Augmentation Radar stations in British Columbia, Ontario and Nova Scotia (Pine Tree).

1955, Sep. 22—Exchange of notes between Canada and U.S.A. concerning the construction and operation of a petroleum products pipeline between the U.S. Air Force dock at St. John's and Pepperrell Air Force Base in Newfoundland.

1956, April 19—Exchange of notes between Canada and U.S.A. respecting the construction of housing units of Pepperrell Air Force Base, St. John's, Newfoundland.

1956, Apr. 23—Exchange of notes between Canada and U.S.A. extending participation in the Canadian Unemployment Insurance Act to Canadian employees of the United States Armed Forces in Canada.

1957, Jan. 17—Exchange of notes between Canada and U.S.A. concerning use of the Haines Cut-Off Road by the United States Army for the winter maintenance of the Haines-Fairbanks Pipeline.

1958, May 12—Agreement between the Government of Canada and the Government of the U.S.A. concerning the organization and operation of the North American Air Defence Command (NORAD).

1958, Sept. 2—Exchange of notes between Canada and the U.S.A. concerning the establishment of a Canada-United States committee on joint defence.

1959, April 13—Exchange of notes between Canada and U.S.A. concerning the construction and equipment required for the augmentation of communications facilities at Cape Dyer, Baffin Island (Dew East).

1959, May 1—Exchange of notes between Canada and the U.S.A. concerning the establishment in Canada of short range tactical air navigation facilities at nine sites (TACAN).

1959, May 22—Agreement between Canada and the U.S.A. to provide for cooperation on the uses of Atomic Energy for mutual defence purposes.

1959, July 13—Exchange of notes between Canada and U.S.A. governing the establishment of an integrated communications system to support the ballistic missiles early warning system.

1960, Aug. 31—Exchange of notes between Canada and the U.S.A. concerning the loan to Canada for a five year period of the submarine USS Burrfish.

1961, June 12—Exchange of notes between Canada and the U.S.A. concerning improvement of the Air Defence of the Canada-U.S.A. region of NATO; the Defence Production Sharing Programme of the two governments and the provision of assistance to certain other NATO governments (SWAP).

1961, Sept. 1—Exchange of notes between Canada and the U.S.A. concerning the disposal of excess U.S. property in Canada.

1961, Sept. 23—Exchange of notes between Canada and the United States of America concerning the addition of Cape Dyer to the annex of the agreement of May 1, 1959 relating to short range tactical air navigation (TACAN) facilities in Canada.

1961, Sep. 27—Exchange of notes between Canada and U.S.A. concerning cost-sharing and related arrangements with respect to planned improvements in the continental air defence system (with annex).

1964, May 6—Exchange of notes between the Government of Canada and the Government of the United States of America to amend the agreement of September 27, 1961 relating to the Continental Air Defence System by cancelling the proposed Gap Filler Radar Programme.

1964, May 25—Exchange of notes between the Government of Canada and the Government of the United States of America concerning the phasing out of certain radar stations of the Continental Radar Defence System within Canada.

1965, May 12—Exchange of notes between the Government of Canada and the Government of the United States of America concerning the establishment, operation and maintenance of a torpedo test range in the Strait of Georgia.

1965, Nov. 24—Exchange of notes between the Government of Canada and the Government of the United States of America concerning the establishment, maintenance and operation of a back-up interceptor control system to strengthen the Continental Air Defence System.

1965, Dec. 1—Exchange of notes between the Government of Canada and the Government of the U.S.A. concerning the establishment operation and maintenance of improved ground to air military communications facilities in northern Canada.

1966, May 11—Exchange of notes between the Government of Canada and the Government of the United States of America extending the period of the loan of the submarine U.S.S. Burrfish to Canada.

1966, June 10—Exchange of notes between the Government of Canada and the Government of the United States concerning the use of land at the United States Naval Base, Argentina, for the establishment of a ferry service between North Sydney and Argentina.

1966, June 15—Exchange of notes between the Government of Canada and the Government of the United States of America concerning the continued use by the U.S.A. of land adjacent to Argentina for the operation of a communications site by the U.S.A.

1967, Aug. 8—Exchange of notes between the Government of Canada and the Government of the U.S.A. revising the agreement of November 15, 1963 providing for joint cooperation on civil emergency planning.

1968, March 30—Exchange of notes between the Government of Canada and the Government of the U.S.A. to extend for a period of five years the agreement concerning the organization and operation of the North American Air Defence Command signed at Washington, D.C. (NORAD) May 12, 1958.

APPENDIX KK

Ottawa 2, July 31, 1967.

Professor Kenneth McNaught,
Department of History,
University of Toronto,
Toronto, Ontario.

Dear Professor McNaught:

Your letter of July 7 to Mr. Curry on the subject of deserters from the American Forces raises several interesting questions.

It is quite true that the NATO Visiting Forces Act is applicable only to foreign military personnel actually on service in Canada, and that consequently a foreign soldier who comes to Canada after deserting somewhere else is not subject to its provisions. I am sure you will agree, however, that neither Canada nor any other member of NATO would be acting in the spirit of the North Atlantic Treaty if it granted immunity within its borders to deserters from the military forces of other members of the Alliance.

The doctrine of "asylum" is not recognized in the Canadian Immigration Act, or in any other Canadian statute to the best of my knowledge. In any event, common usage suggests that it really has no application to citizens of friendly countries, particularly those having democratic forms of government similar in principle to our own. The connotation surely is that a person seeking "asylum" aims to escape from political persecution by a regime having totally different standards from ours. A deserter from the American Forces, or from those of most other NATO members, is certainly not in danger of political persecution, though he may well be faced with prosecution.

People seeking admission to Canada must be examined either as immigrants or non-immigrants as defined in the Immigration Act. Those seeking permanent residence, as most deserters do, must be dealt with as prospective immigrants, and this means among other things that they must be able to meet the requirements set forth in Section 31 of the Immigration Regulations. The possession or non-possession of an immigrant visa or letter of pre-examination, under Section 28 of the Regulations, is primarily indicative that an immigration officer has examined the prospective immigrant and decided that he is or is not admissible under Section 31. Visas or letters of pre-examination are not issued or withheld simply as a means of allowing people in or keeping them out, but

only when the basic decision as to admissibility has been reached. The corollary, of course, is that a person is refused admission, or ordered deported, not simply because he lacks a visa or letter of pre-examination, although this may be the technical reason, but in substance because the lack of the document is indicative of a decision by an immigration officer that the person concerned is not admissible under Immigration law.

In reading Section 31 of the Regulations you will have noted that the admissibility of people who do not have relatives in Canada is made contingent on their likely ability to establish themselves successfully in Canada. Personal qualities are of major significance in reaching a decision on this point, and motivation is one of the qualities to be taken into account. A person who comes here because he believes it to be a good country to live in, and one that offers him better opportunities, is more likely—other things being equal—to make the transition successfully than is a man whose chief motive is to avoid responsibilities in his own country. Accordingly, there have to be rather special circumstances before we accept an applicant seeking to escape from his creditors, his wife, or some other legal obligation under the laws of his own country. I think you will agree that, under the Immigration Act, we have to look at military deserters in this general category.

As you will appreciate from the foregoing, our policy in dealing with deserters from any country, not just from the United States, stems not only from NATO commitments; it is based more broadly on the Immigration Act and Regulations. The policy is not a new one, nor is it aimed specifically at deserters in general or at American deserters in particular. Rather, it is a reflection of general immigration policy on the admission of people to Canada.

If you have further questions on the subject, please feel free to ask. I will be glad to hear from you again in any case.

Yours sincerely,

J.C. Morrison,
Director, Home Branch,
for Assistant Deputy Minister
(Immigration).

HOUSE OF COMMONS

First Session—Twenty-eighth Parliament
1968-69

STANDING COMMITTEE

ON

**EXTERNAL AFFAIRS and
NATIONAL DEFENCE**

Chairman: Mr. IAN WAHN

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 29

THURSDAY, FEBRUARY 20, 1969

Respecting

Policy-defence and external affairs

WITNESS:

(See Minutes of Proceedings)

The Queen's Printer, Ottawa, 1969

(Quorum 16)

Hugh R. Stewart,
Clerk of the Committee.

ORDER OF REFERENCE

HOUSE OF COMMONS,
THURSDAY, February 20, 1969.

Ordered,—That Votes 1, 10 and 15 relating to the Department of External Affairs;

Votes 30, 35 and L35 relating to the Canadian International Development Agency;

Vote 40 relating to the International Joint Commission;

Votes 1, 5, 7, 10, 12, 15, 20, 25, 30, 35, 45, 48 and 50 relating to the Department of National Defence; and

Vote 55 relating to Defence Construction (1951) Limited be referred to the Standing Committee on External Affairs and National Defence.

ATTEST:

ALISTAIR FRASER,
The Clerk of the House of Commons.

MINUTES OF PROCEEDINGS

THURSDAY, February 20, 1969

(43)

The Standing Committee on External Affairs and National Defence met at 11:05 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Anderson, Barrett, Brewin, Cafik, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, MacDonald (*Egmont*), MacLean, Marceau, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch (24).

Also present: Messrs. Buchanan, Gillespie, Hymmen, M.P.'s.

Witness: Mr. David Golden, President, Air Industries Association of Canada.

The Chairman made the following report from the Subcommittee on Agenda and Procedure:

"TUESDAY, February 18, 1969.

(19)

FOURTH REPORT

A meeting of the steering subcommittee was held on Tuesday primarily to plan our proposed trip to Europe. The plan now is that the Committee would leave Sunday, March 9, and it would return to Ottawa Saturday, March 22. Reasonably satisfactory arrangements, I believe, have been made so that those Conservative members who want to attend the annual Conservative meeting can do so and then catch up with the Committee in Europe without too much trouble. Without getting into a lot of detail it is proposed that we go to Cyprus, Germany, England, Switzerland, Sweden, France and Belgium and we will, of course, visit defence installations, but primarily the purpose is to obtain evidence from knowledgeable people that we could not expect to come to Canada to give evidence to the Committee.

In Switzerland and Sweden we will be interested in civil defence and neutrality arrangements. In Belgium, of course, we will visit NATO headquarters. In London and Paris we want to attend briefly some of the institutions of strategic studies. Basically we are attempting to obtain information abroad which is not available to us here in Canada. Originally we had planned to make that trip from March 14 to the end of the month. It has been moved forward five days because the members of the steering subcommittee have come to the conclusion it would be desirable, if possible, to submit a preliminary report to Parliament before the Easter recess. This, of course, would depend upon the wishes of the members of the Committee but certainly almost unanimously the members of the steering subcommittee thought it would be desirable to present a preliminary report and it was felt we should be working on that report,

really we should be thinking about it now, while we are in Europe with a view to actually presenting it to Parliament before Parliament rises for the Easter recess. It was mentioned to us that there is a NATO ministerial meeting in Washington on April 10, I think, and this was another reason why we thought it would be desirable that our preliminary report should be available before the Easter recess.

We are still contacting the people we want to see in Europe and anything we circulate will be tentative indeed. Until we actually get on the plane everything is subject to change. We must, of course, get an order from the House permitting this trip to be made. I believe that will be forthcoming but I think we can circulate something which will be of some assistance to members. Also a memorandum will go out to members indicating what has to be done in the way of vaccinations, passport arrangements, and that sort of thing.

The list of witnesses was reviewed by the steering subcommittee some considerable time ago and a list of possible witnesses was settled and then from that time we have been making arrangements to settle mutually convenient dates when these witnesses could appear before the Committee. It is interesting to know that we have received a very large number of offers of briefs from a number of national organizations and also from many individuals. It is desirable that there should be this public interest and we have taken the position that we welcome all briefs and that all serious briefs will be circulated to members of the Committee if we are provided with a sufficient number of copies. We are anxious to have views, not only from national organizations, but also, of course, from individuals. Unfortunately it was not possible to make arrangements to give all of them who wished to appear the opportunity of presenting their views in person to the Committee. We did our best to settle a list which we thought would be fair and which would be useful to members of the Committee and I say, unfortunately, we are unable to hear all of those who wished to appear. Subject always, of course, to last minute changes the list of witnesses is as follows: Today, of course, we have with us Mr. Golden, then on February 25, Professor John Warnock, February 27, Professor Legault, March 4, Professor Stephen Clarkson and then we have one further sitting before we leave on the trip and we have three or four people on the list that we would like to consider. A decision on our final witness before we make the trip should be made very soon. That briefly brings you up to date with the suggestions made by the steering subcommittee."

On motion of Mr. Winch, the Subcommittee report was adopted.

On motion of Mr. Gibson,

Resolved,—That reasonable travelling and living expenses be paid to Professors J. Warnock, A. Legault and S. Clarkson, who have been invited to appear as witnesses before this Committee, in the matter of the Committee's Order of Reference dated Thursday, January 16, 1969.

The Committee agreed to print Mr. David Golden's advance presentation entitled *Canadian Defence Policy And The United States* and his biographical sketch, as an appendix to this day's Minutes of Proceedings and Evidence. (See Appendix 11)

The Chairman introduced Mr. David Golden, who made a brief opening statement. Members of the Committee questioned Mr. Golden on various aspects of defence policy, with particular reference to views expressed in his advance presentation.

The Committee completed its questioning and the Chairman thanked Mr. Golden for his testimony.

At 1:00 p.m. the Committee adjourned, until Tuesday, February 25, 1969 when the witness will be Professor J. Warnock.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Thursday, February 20, 1969

The Chairman: Gentlemen, it is after 11 o'clock so perhaps we could get started. Before hearing from the witness who is with us this morning, perhaps I should make a brief report with regard to a meeting of the steering committee (See Minutes of Proceedings).

Mr. Winch: I move the adoption of the report of the steering committee.

The Chairman: Is it agreed that we adopt the report of the steering committee?

Motion agreed to.

The Chairman: May I have someone move the following formal resolution that reasonable travelling and living allowances be paid to Professors J. Warnock, A. Legault and S. Clarkson, who have been invited to appear as witnesses before this Committee in the matter of the Committee's order of reference dated Thursday, January 16, 1969.

Mr. Gibson: I so move.

Motion agreed to.

The Chairman: A summary of Mr. Golden's remarks has, I believe, been circulated to members of the Committee. Is it agreed that this should be printed as an appendix to our proceedings?

Some hon. Members: Agreed.

The Chairman: Gentlemen, today the Committee begins its specific examination of defence relations with the United States, the third area of investigation, as outlined in our program. Our first witness will be Mr. David Golden whose written statement "Canadian Defence Policy and the United States" has already been circulated.

A lawyer by training, Mr. Golden's past experience has included appointments as Deputy Minister of Defence Production; President of Northern Ontario Pipeline Corporation and Deputy Minister of Industry. He is now President of the Air Industries Association of Canada; Chairman of the

Board of Governors of Carleton University and a Director of Atomic Energy of Canada Limited. This experience has given him a broad view of Canadian-U.S. economic relations as well as a comprehensive knowledge of technical details about defence and defence production sharing arrangements with the United States and their ramifications. It is because of this broad and very relevant experience that he has been invited to appear as a witness before the Committee at this particular stage in our deliberations.

Mr. Golden, do you have a few preliminary remarks to make?

Mr. David Golden (President, Air Industries Association of Canada): Yes Mr. Chairman, there are just a very few comments I would like to make. Firstly, although it hardly needs to be said to those of the members of the Committee who know me, I do think it should appear on the record that I am not an expert and I would not like it to be thought that I am posing as an expert.

Secondly, I should like to make it perfectly clear that I am speaking only for myself and expressing personal opinions which I formed over a period of years.

If I had to summarize my views on this subject in a very few words I think it would go something like this. U.S.-Canadian relations in defence and in other areas are of paramount importance to Canada and should receive the attention that they deserve. Defence policy cannot be looked at in isolation but must be related to many other factors as well. If resources permitted everything to be done which was desirable or useful, then no painful priorities would be needed, but since this state of affairs is highly unlikely, then Canada's main interest should receive priority attention.

I do not believe that economic considerations should dictate our defence and foreign policy but I do believe that the economic consequences of the various options which are open to Canada should be well understood.

That is all I want to add to my notes, Mr. Chairman.

• 1115

The Chairman: Thank you very much, Mr. Golden. Mr. Brewin, do you have a question?

Mr. Brewin: Yes, I did not expect to be called on so early so I am not ready to go into it right away. Mr. Golden, as I understand the remarks you have just made, the problem in defence matters is a selection of priorities; you cannot have everything, and if you select one thing it may mean that you eliminate another. Is that a fair statement?

Mr. Golden: Eliminate or downgrade, depending on possibilities.

Mr. Brewin: Yes, eliminate or downgrade something else. There is one part of your written paper that I find difficult to understand and perhaps you could go into it a little more fully. That is on page 2, paragraph 3:

In other words, Canada should play a role in defensive measures considered important by the United States, even if our assessment of the necessity of such measures should be at variance with that made by the United States.

If I understand that, supposing we came to the conclusion that the Bomarc missile or SAGE system of defence against manned bombers was no longer useful, and that was our view, and if the people in the Pentagon or the American government said, "We think it might have some marginal utility and we have plenty of money to spend on these things and we want to continue it", would you say that in those circumstances Canada should choose as a priority, a system of defence that it thought was obsolete but some American authorities thought should be continued?

Mr. Golden: It is a question of degree, Mr. Brewin. I think that in any black or white case it would be very simple. If Canadians were unanimously of the view that a certain defence system made absolutely no sense at all, then I would expect Canada to fight vigorously to have those views adopted by the United States. But in my limited experience it is seldom that these cases are so clear, and the point I was trying to make is that in those cases where it is not clear, we should always bear in mind the very heavy responsibilities which the United States bears which we do not, and we should seek to accommodate ourselves provided no essential Canadian interest is thereby lost sight of or abrogated.

Mr. Brewin: Does the difficulty with that not arise out of your opening remarks, that we cannot do everything? By assumption, if the Canadian Government takes a certain course that is not essential or required, but by reason of being persuaded by a contrary view of the American authorities it decides that it would like to accommodate the American point of view, by so doing is it not excluding the doing of something which in its conviction is necessary and may also be useful as far as the United States is concerned?

Mr. Golden: Well, this is quite possible. The point that I am making is that within the context of North America, and within the context of Canadian-United States relations, I feel that these matters deserve priority attention and more flexible response than would be the case in any other meaningful defence role that we might choose.

Mr. Brewin: You would not agree, then, that the most essential part of sovereignty is not, perhaps, questions of territory or matters of that sort, but the ability to make up your own mind, according to the best of your own judgment, what actions you are taking for your own security within the limitation of your own means?

Mr. Golden: I do not argue with that. It is the question of the application of that principle that gives me concern. I do not argue with that statement at all. Independence today, unfortunately, in my judgment, is not quite as simple as that categorical and very lucid statement that you just made.

• 1120

Mr. Brewin: But you do say, after all, that Canada should play a role in defensive measures considered important by the United States, even if our assessment, of necessity, should be at variance with that made by the United States. What I am trying to suggest is that in this field we should consult fully with the United States, and if we come to a contrary conclusion, should we not stick to our own conclusions if we want to claim to be a sovereign state?

Mr. Golden: Well, I really cannot add anything to what I said earlier: I agree with your statement and I think it is in the application of it that the difficulties arise, and I believe that within the context of these Canadian-American relations it just becomes that much more difficult.

Mr. Brewin: Thank you.

The Chairman: Mr. Stewart?

Mr. Stewart (Cochrane): Thank you, Mr. Chairman. Mr. Golden, I would like to say first of all that after some of the witnesses we have had recently, it is most refreshing to receive you, and I agree with everything you say in your paper. I think the idea of thinking of North American defence in any other context but as of the whole, with both of our countries working together on it, is unthinkable.

You have not spoken about the other phases of our foreign policy and I do not know if you wish to comment on them. You are saying here that: other roles can be added, but not at the expense of the North American one. Would you advocate our leaving the NATO organization and strengthening our NORAD one?

Mr. Golden: I would like to deal with that in a somewhat circuitous way, if I may. This is a very, very difficult question and it is a matter on which I have tried to do some thinking and I am not at all certain that my own view does not change as different factors are fed into the thinking process.

First of all, I believe it is quite proper and appropriate to regard Canadian participation in NORAD as being a contribution to NATO. I am not qualified to get into the very difficult discussions that took place some years ago about whether NORAD is or is not part of NATO, but it seems to me that it would be very difficult to argue that it is not a contribution to NATO. So, I would say that first, that NORAD is a contribution to NATO.

Secondly, I am going on the assumption that we are dealing with finite resources and that those resources within the foreseeable future are likely to be somewhat less in relation to the total resources available to the nation than was the case 12 or 15 years ago. If you were to ask me, what would I think of NATO in relation to a present national defence budget of \$2 billion or \$2.1 billion or \$2.2 billion, I think I would say that I would regard the Canadian contribution to NATO as of very considerable importance. But in relation to a national defence budget of \$1.81 billion, or in those numbers today, then I feel that, of necessity, some downgrading of the Canadian contribution to NATO is going to have to take place. I feel that over the next four or five years, assuming no increase in the defence budget and assuming what has

been going on for so many years escalation in costs and buying less with your dollar year by year—that it would be necessary for Canada to negotiate a substantial reduction of the Canadian forces in NATO.

Mr. Stewart (Cochrane): And I dare say, this would be even more so if we wanted to cut down our defence budget?

Mr. Golden: Yes, indeed.

• 1125

Mr. Stewart (Cochrane): I wonder, Mr. Golden, if you would mind commenting on going back to our actual North American defence set up. We have an arrangement with the United States whereby we are pretty well integrated with them, and we have heard from other witnesses—at least it appears to me—that the naval participation by Canada is worthless, that it would require a great deal of money to bring it up to date, and, even then, it is doubtful if its role would be efficient because of the fact that the American Navy has some difficulty with regard to submarine detection and so on. Could you comment on this aspect? It seems to me that either we would have to spend a lot of money or scrap it, and I would rather lean towards the latter suggestion. Would you like to comment on that?

Mr. Golden: My difficulty is that I am not competent to discuss the technical aspect at all. I really have no idea at all about the efficacy of the naval forces which Canada presently disposes. I never did know very much about it, but the little that I do know is some years out of date.

With respect to the other part of the question, here again it is probably a question of degree. These matters, in my judgment, should be decided jointly. Canada is going to devote very limited resources to these things and it seems to me that we must decide jointly which of these tasks that can be assigned are likely to be performed most effectively by Canadian forces using Canadian equipment. There again, it is a matter of fitting what is, in world terms, a relatively modest contribution into a vast number of tasks, many of which, I suppose it can be argued independently, are of tremendous importance. It is only when you relate them to other tasks, in my view, that they then begin to assume relative importance.

Mr. Stewart (Cochrane): This is exactly what we did with regard to the Air Force, is

it not? Together with the United States it was decided that the bomber force would be looked after by them; this was too big an undertaking for Canada, and so we stuck to the fighter role. In this particular instance do you not think that Canada is too small a nation to take on all of the aspects of defence, including the naval one?

Mr. Golden: Surely, it is true to say that even in this area we by no means cover all aspects of naval warfare; even there we have limited ourselves to a couple of the quite numerous options which are open, whereas, of course, the United States feels it must exercise all options.

Mr. Stewart, my difficulty is that I really do not know too much about the nature of the Canadian contribution on the naval side in relation to what one would expect in the early 1970s to get, dollar for dollar.

Mr. Stewart (Cochrane): Fine. Thank you very much, Mr. Golden. I thought maybe I could get you to agree with me.

The Chairman: Mr. Thompson?

Mr. Thompson (Red Deer): Mr. Golden, I find paragraph 4 on page 4 to be a very interesting statement. I must confess that I have to agree with the preliminary statement of Mr. Stewart on his reaction to this paper as it might be compared with others we have had recently.

We will be going to Europe with the basic purpose of trying to gain a deeper viewpoint of the NATO responsibility from over there. You say that there is no more important defence role that Canada can play than that in North America. What relationship exists between the defence of North America and the defence of Europe through NATO and our responsibility to that aspect of it, in your opinion?

• 1130

Mr. Golden: I think there are two relationships. First of all, there probably exists a relationship in the Canadian mind which, in my view, is paramount. Secondly, there is a relationship which exists in the minds of the United States, which, I would say, comes second. In Canada we tend to think of our role in North America and our role in NATO in both cases as measures for collective defence; and I believe that is correct. Perhaps when you go down to Washington you will find that there are many people who think

the Canadian role in NATO also has an influence on the attitude which other members of NATO might hold and that consequently in Washington there will be, or there is, among some people, a feeling that the Canadian role is important not only for itself but also for the effect it will have on decisions which other members in NATO might take in the future.

Mr. Thompson (Red Deer): Leaving the attitude of the United States towards what influence we might have on some of the other NATO members, what is your thought in regard to that responsibility as it relates to, shall we say the smaller European members of NATO such as Norway, Denmark, Holland, Belgium and even down at the southeast end, Turkey and Greece?

Mr. Golden: I believe in NATO. I believe that it is an alliance which has been absolutely essential. I believe it should continue. I believe Canada should continue to be a member of NATO. My difficulty arises when I try to analyse what forces Canada should put at the disposal of NATO in the context of the kind of budget that we have been talking about.

I also believe that we have not taken sufficient account of the changed character of Europe between 1950 and 1970. At the time that we talked about going into NATO, Europe was almost prostrate after the war. Canada not only had not been touched physically but in fact it had an incredible expansion of its industry and for a short while—a period which I must say I think some people do not seem to realize is now gone—for a short while we were one of the great military powers in the world, and it seems to me it was quite appropriate that we should at that time have shouldered the burden in NATO that we did. I feel that that kind of burden in relation to the other tasks which we now are called upon to perform is no longer appropriate. In my view it is a question of degree rather than of getting out or staying in.

Mr. Thompson (Red Deer): From your knowledge of the policies and attitudes of some of the smaller countries of Europe that I have just mentioned, do you think the most logical approach, in trying to work out what would be Canada's role in its commitment to NATO, should be in close consultation with the smaller countries of NATO, and that their attitudes are even more important, shall we say, than the attitudes of the United

States and some of the other larger countries such as France and Germany?

Mr. Golden: Yes, I think any renegotiation of the Canadian role in NATO should most certainly be done in closest consultation with the members of the alliance and, although I have no special knowledge in this regard it may be, as you say, that it would be particularly necessary that we should consult with the smaller members; it may very well be.

The reason I keep mentioning consultation with the United States is that it is part of my central theme—that there is nothing more important for the long-term future of this country than that we should understand what the United States hopes to achieve out of these various alliances and they should understand what it is we hope to achieve; that they should understand there are Canadian thoughts and views, as Mr. Brewin said earlier, which in some particulars will be very different from theirs. But I keep coming back to the central core of my theme, which is that Canadian American relations are paramount in all of these areas. But I agree with your comment.

• 1135

Mr. Thompson (Red Deer): In regard to the premise that you have just stated, I think it is a fair assumption that Russia probably fears West Germany more than any other aspect of stability in Europe. For that reason and also for other reasons the United States must place very great importance upon the role of West Germany as well. How much do you believe the West German picture vis-à-vis the situation in France affects American thinking that may relate back to us in our relationship with the United States in NATO policy?

Mr. Golden: I have no doubt that all of these things are matters of great importance. I myself have never been able to find convincing an argument which is sometimes put forward—I am not suggesting that you have put it forward—that we really must stay in NATO to make sure that Germany behaves itself. I cannot conceive that this is an appropriate role for Canadian forces in Europe.

Mr. Thompson (Red Deer): My next question, Mr. Chairman, relates to my own interest and experience in Africa and the role that we have to play in the emerging areas such as Africa. How much do you feel that our relationship in NATO, as it reflects to

such countries as Portugal, affects our external policy in other parts of the world such as Africa, and how does it affect our own position as far as the world is concerned?

Mr. Golden: There are anomalies in our foreign policy. There are anomalies in every country's foreign policy. We all remember so well not so many years ago when a very important and very populous country was telling others how wrong they were to worry about Communism and then suddenly a very aggressive neighbour got a little rambunctious on the border and this preaching ceased almost instantly. I feel that what you have said is a difficulty but there are these difficulties in all manifestations of a country's foreign policy, which presumably will represent an amalgam of the best of what is possible and feasible in the pursuit of national interest. And that is why I was careful to say in the introductory paragraph of my brief that I did not think any of the terms that are commonly used—the free world and the Western world—are really all that accurate but that they do have some semblance of truth in them.

The Chairman: Mr. Winch.

Mr. Winch: Mr. Chairman, honestly I believe that Mr. Golden is a bit more of an expert than he is leading us to believe. My first question was asked by Mr. Stewart. I would like to ask a couple of questions based on an area in which this Committee is interested and upon which I am certain that Mr. Golden is an expert.

I believe, Mr. Golden, that you were the Deputy Minister of Defence Production for some two years? Approximately.

Mr. Golden: No, it was a lot longer than that.

Mr. Winch: All right. You were the Deputy Minister of Defence Production. Mr. Golden, because you are the first witness that we have had with any knowledge of this most important aspect of our discussion, could you from your experience and knowledge, first of all let us know whether the Department of Defence Production was strictly a contract letting department, working on the basis of the request and specifications supplied you by the Department of National Defence?

And may I put the second question at the same time. Can you give the Committee an understanding as to what was the policy and what were the procedures whereby you tried

to bring into some kind of alignment the expenditures which Canada made, and is still making in the United States, and United States military expenditures made in Canada?

And a third point on the same line of questioning. In view of your vast amount of experience in this sphere as Deputy Minister of Defence Production and the fact that Canada is still in a deficit, a rather heavy deficit position resulting from our military purchases in the United States and their purchases in Canada, is there any advice that you can give us as to how we might bring this more into alignment and adjustment?

Mr. Golden: Well, Mr. Winch, I must say I did not bargain on this one. Let me do the best I can. First of all, as you probably know I have not been Deputy Minister of Defence Production for almost seven years and I must say I do not spend most of my time worrying about what I used to do in Defence Production, so some of these things are...

Mr. Winch: You could not have had those years of experience without coming to some conclusions.

Mr. Golden: Yes, but whether the conclusions are valid or not is another matter. As far as procurement is concerned, you will no doubt recall Mr. Howe telling the House of Commons that National Defence orders a gold piano and Defence Production buys it. I do not think it was like that when he said it; I do not think it was like that before he said it; I do not think it was like that after he said it, but nonetheless there is a real germ of truth, or there was—anytime I say “is” I hope you will understand I am saying “was” because I am not that up to date. There was a real germ of truth in that. The Department of National Defence, when the Department of Defence Production was set up, never surrendered their right to call up products, to decide what their specifications were, either performance specifications or what have you, and I do not think that was changed when the Department of Defence Production was established in 1951. Nonetheless as between reasonable men there is a great deal of difference between saying that Defence Production will buy whatever the Department of National Defence calls up and that Defence Production is going to insist that National Defence buy product A or product B. There is a very, very wide spectrum in between. Certainly in my experience there were many cases when the Department of National Defence would be

reasonably happy with one of several different products and consequently were prepared to allow the economic or industrial connotations of one purchase as against another to prevail; and there were many cases where this was not possible and no industrial or economic consideration obtained because a particular product was required for a particular requirement.

But the number of purchase orders, the number of products involved runs into the tens of thousands in the course of a year and it is very difficult to give principles of general application which one cannot immediately seize upon and say, “That was nonsense” in one particular case or another. But certainly, if I understand your question correctly, the Department of National Defence as the user department had the right to require certain products to be manufactured or purchased, but this was subject to negotiation in many cases.

Mr. Winch: On that position, as we all know Canada seemed to have a policy of buying what was being declared obsolete in the United States and yet we bought; like the *Voodoo*, the *Bomarc*, etc. When you were Deputy Minister of Defence Production was the matter raised when the Defence Department said, “This is it”, or did you have to follow through and make the purchases even if the United States were declaring them obsolete?

Mr. Golden: Mr. Winch, that is a much different question and really, with respect, what you have just said is not so. You said the Defence Department bought the *Voodoo* and the *Bomarc*. The *Voodoo* and the *Bomarc* were acquired by virtue of a very, very complicated inter-governmental transaction involving hundreds of millions of dollars. All documents I assume are available to members of Parliament; anyhow they are not available to me. I know you did not expect me to feed your words in any legalistic way, but nonetheless it is not true to say that the *Voodoo* and the *Bomarc* were bought in the normal sense of the word “bought” and did Defence Production say anything about it. In fact we were in the middle of that transaction; we played a very active role in that transaction; not on the policy side but on the administrative, executive side, and it was a very, very difficult, complicated intergovernmental transaction and the word “bought” does not really describe it at all.

Mr. Winch: Would you now explain to us U.S.-Canadian purchases and offer any advice as to how we can bring our deficit a little more in balance.

Mr. Golden: I am not familiar with the day to day figures. I only see them when they are published, but it was my understanding that on strictly military products, as defined in the various agreements between Canada and the United States, in fact that deficit does not exist. If it does it is a rolling deficit and not of any real consequence. Of course, the overall deficit in trade between Canada and the United States in normal years is very, very great indeed, but it is my understanding, subject to correction, that in recent years the transactions between the two countries on military procurement are not out of balance; however I only see the published figures; I do not have access to anything else.

• 1145

Mr. Cafik: Mr. Golden, I would like to refer to the paper that you gave us prior to this meeting. On page 2 you indicate,

...Canada should play a role in defensive measures considered important by the U.S. even if our assessment of the necessity of such measures should be at variance with that made by the U.S.

Surely one would not draw the conclusion from that remark that if we felt our contribution was of no value to North American defence we should proceed in any event.

Mr. Golden: I can see now in retrospect that perhaps I should have worded that differently, although I do not withdraw anything I have said there. I suppose instead of a period I should have had a comma or colon, or something. I really meant that sentence to be read with the next sentence where I said,

I do not mean by this that Canada should surrender her right to make an objective appraisal of each situation as it comes up—what I do mean is that Canada in making such an appraisal should consider the role played and responsibility borne by the U.S.

Mr. Cafik: Yes, but I do not really think that answers the question. I had also read further. I agree we should take their interest into consideration, but that does not mean to say that we must act upon those interests against our own, or against our own judgment. If we are going to have the right to

make a judgment, surely we have the right to make the judgment to stay out of or to get into NORAD, for instance.

Mr. Golden: Oh, yes, but you see I differ with you on this point. I think the right to make a judgment does not necessarily mean that you are going to act on that judgment. You might make a judgment that a particular defensive system is less important than the United States considers it to be. You might, nonetheless, decide to go along under whatever appropriate conditions and terms could be negotiated.

I do not believe that making a judgment necessarily means that you then carry through and execute that judgment. There may be many reasons why you would make it and for other good and sufficient reasons modify the judgment that you have made in the execution thereof. That is the point I am trying to make.

Mr. Cafik: Surely there is not much point in making a judgment if you feel compelled not to exercise it.

Mr. Golden: I do not think that at all. I think there are many cases where Canada will, of course, feel impelled to exercise it. I am also saying it is possible that there are cases where, bearing in mind the responsibilities which the United States bears, Canada might decide, weighing in balance all the factors, that it will not exercise it. I quite agree that there are many cases where it would be unthinkable for us to yield what our judgment tells us is the right thing to do.

• 1150

Mr. Cafik: All right; thank you on that point. On page 3 you indicate that the United States, in exercising its leadership and responsibility, will ordinarily be prepared to permit its security to be adversely affected by the action or inaction of a close neighbour. In previous testimony before this Committee some witnesses have indicated that the United States might take rather severe action in respect of Canada if we did not behave in just the right way in relationship to her. What is your view of this?

Mr. Golden: I certainly would not put it in that way. That paragraph represents my best judgment of this matter and it is only a private, personal judgment; it is not an exercise in morality. In that paragraph I am not really trying to discuss the morality of the way in which nation states operate; I am trying to

indicate that I do not believe on a major matter of security the United States could consider of no consequence what action Canada might take.

I go on to say I do not suggest for a minute that we are about to be overrun and occupied every time we tell the United States they cannot do something. My whole experience, of course, has been the other way, limited though it is. In most matters of dispute the United States has been very reasonable about considering Canadian points of view. I was never charged with any policy responsibility, but executing some of these policies can also become difficult sometimes.

All I am really saying here is that it is not the same when you are a modest power as it is when you exercise very, very onerous world responsibilities.

Mr. Cafik: If they are very reasonable in their relations with Canada, is that because Canada normally accedes to their wishes? How reasonable would they be if we were not quite so co-operative? I know experience indicates that they have been reasonable, but they have had no reason to be unreasonable.

Mr. Golden: I hoped I was careful to say, "in my experience". It may be that there are some people here who have always had to negotiate with them in other matters where they were always unreasonable. The gamut of Canadian-American relations is very wide indeed, and I was not trying to cover the entire gamut of U.S.-Canadian relations.

The Chairman: Mr. Cafik, may I ask a supplementary?

Mr. Cafik: Yes, by all means, Mr. Chairman.

The Chairman: At that point, Mr. Golden, you indicate there are an infinite number of possible actions that could be taken by the United States. Were you referring to the possibility of economic pressure among other causes of action?

Mr. Golden: Yes, but even before you get to economic pressure it is my understanding that there are subsisting today a number of very special relations between Canada and the United States which are based upon the concept of a commonality of interest in defence measures. In my view that is one step before you get to pressure.

It seems to me it would be quite appropriate for the United States to say, "There are certain agreements that we have: there are

certain understandings that we have which are based on the idea that we do have a common interest in defence. If we do not have that common interest, is it right that Canada should have that special relationship?" I suppose that is not the same as economic pressure, which I would think is: "You behave or else the United States has certain things it can do". I am no better equipped than anybody else to say at what stage this might or might not take place or whether it would.

I think we have to bear in mind this is just elementary, but sometimes we tend to forget that not only does Canada have an interest in good Canadian-U.S. relations, but the United States has a very keen interest in this as well. When I am asked about the Canada-U.S. production sharing arrangement, I sometimes have to remind people this was entered into by the United States freely and willingly because it had advantages to them as well. This is not something that smart Canadian negotiators slipped over on the Americans who did not understand what was happening. There is a commonality of interest in all things.

• 1155

Mr. Cafik: In your arguments in respect of national sovereignty you say if we are not going to go through a common effort then we would need forces to do the job ourselves. Further, immediately following, you indicate that if we adopted a neutral or, I presume, a non-aligned stance we would also have to have a defence force to secure that type of establishment. Have you any idea what the cost to the government would be for these two alternatives? Would it cost us less money than our present budget of \$1.8 billion for defence, or would it cost more?

Mr. Golden: I think a lot would depend on how far you want to go, but certainly a Canada capable of keeping the United States and Russia out of its air-space would certainly require, in my view, a budget vastly greater than \$1.8 billion. A Canada prepared to investigate every unknown blip on the radar screen with Canadian aircraft, Canadian warning and control and communications, and so on—I am not enough of an expert to know but there again I should think the costs are likely to be very great. There is not only air; there is sea—air, land and sea forces. I would say that an effective neutrality where we tell everybody to stay off and where we

have the means of keeping them off would be a very expensive undertaking indeed.

Mr. Cafik: This brings up the next question. You talk about the "free ride" concept. I am rather inclined to think that Professor McNaught who was our last witness had this in mind. In any event, you speak of public opinion, you think the public would reject this idea of a free ride. Professor McNaught rather thought that perhaps the public had been misled in its views; that we had begged the question—the government talks about the necessity of NATO and for a number of years we were constantly involved in justifying NORAD—and that we had, in effect, created a condition where the public may have a misinformed judgment. He rather felt that if he had a chance to put forward his propaganda everybody would believe precisely the opposite.

Mr. Golden: I did not realize that Ken McNaught had had any trouble with his propaganda. I tried to come to the hearings to hear Professor McNaught, but you were in a very small room and I could not get in. I read his paper but I did not hear the questioning. I really cannot comment on that.

I am not expert on what 21 million Canadians think or feel. I tried to be honest with the Committee. It is just wrong for Canada to say that we do not have to do something because the United States will do it for us. I just do not think this is the way in which one builds a nation, but other people may have different views and I respect them for it. As far as other aspects of the free ride are concerned, of course, it will not get you very far. As I tried to point out in the first paragraph, you are not only going to get a free ride, you may be taken for a ride.

Mr. Brewin: May I ask a supplementary? I agree with your concept of the free ride, but is it not possible to say that because you are freely getting your main territorial defence supplied by American forces, this releases you to do entirely different things. This does not mean that you do nothing; it means, however, that your role is changed by reason of the existence of the geographical fact that you are part of the North American continent; you are within the American zone of defence whether you do anything or not. Does this not change your role? I think even Professor McNaught would be more in favour of that proposition than a free ride, saying Canadians should do nothing as a result of this.

• 1200

Mr. Golden: I agree with that. Of course, it is also true we sometimes forget that we always contemplate allowances, because we have very distorted forces. Looking at the Canadian forces in isolation they make absolute nonsense unless you contemplate that we will be in alliance, and pre-eminently in alliance, with the United States of America.

Mr. Cafik: I have one other line of questioning. I have the impression—I may be wrong—that your primary view is that we should align ourselves very strongly with the United States through NORAD and that our involvement in NATO is of lesser significance. Is that a fair statement of your position?

Mr. Golden: That is a fair statement, except that I believe that NORAD is really contributing to NATO and can properly be considered a part of NATO. But with that amendment, I do not quarrel with what you say.

Mr. Cafik: It has been maintained by many, and I think it is a generally accepted view, that there is no defence in the event of nuclear war. By that I mean, no defence sufficiently adequate to ensure that the lives and property of our people would be safeguarded. Would you take the same view?

Mr. Golden: I would not say "no defence", but that it would not be very effective.

Mr. Cafik: All right. That leads me to this question: The argument put forward in favour of our involvement in NATO directly in Europe is that it is primarily a role to prevent the occurrence of war and that perhaps NORAD is primarily a defence against the event of war.

Mr. Golden: I would not agree with that at all. I would think that is not accurate at all. The main purpose of NORAD is also to provide credibility so that people do not start a war. Once it is started you try to do certain things about it. But they are all designed to avoid this war, and I would not draw any distinction at all. I really find that line of thought very difficult to accept.

Mr. Cafik: Do you consider all the nuclear deterrent resident in the United States—its ballistic missiles and submarines, and so on—all part of NORAD?

Mr. Golden: It is not part of NORAD necessarily, but NORAD is part of it, in the sense that this is what NORAD is all about.

Mr. Cafik: Is not NORAD primarily an organization to prevent anyone launching a successful attack against the United States?

Mr. Golden: My understanding is that these are all designed to convince a would-be aggressor that it is not going to be worthwhile trying it, and, consequently, it is all just as defensive—one or the other. If the unthinkable occurs then, of course, you have got to carry on. But the concept in my view is exactly the same in both NATO and NORAD.

Mr. Cafik: Can we make as significant a contribution to NORAD as we can to NATO?

Mr. Golden: In my view we can make a significant contribution anywhere providing we are prepared to devote the necessary resources. I have gone on the assumption, which might be totally wrong, that we are looking at defence budgets somewhere of the order of magnitude of what we have now. If that assumption is wrong, then I would like to make another appearance before the Committee.

Mr. Cafik: You do not feel that the defence budget should be increased or decreased but that it should mainly stay as it is?

Mr. Golden: I am not making any observations about whether it should or should not. I am trying to give my best judgment, in analyzing these policies, of what I think will be.

Mr. Cafik: You feel that we should cut back our military participation in NATO?

Mr. Golden: I believe that in concert with our allies, not abruptly, not unilaterally, and spread over four or five years, if the defence budget is going to remain in the same ball park as it is now, we should reduce our military contribution to NATO substantially.

Mr. Cafik: But you feel that we should still maintain our alliance with NATO?

Mr. Golden: Indeed I do.

Mr. Cafik: Thank you very much, Mr. Chairman.

The Chairman: Mr. Laniel, and then Mr. MacDonald.

Mr. Laniel: Mr. Golden, many of my questions have been asked but perhaps I could ask you for a personal opinion. You must

have been travelling as Deputy Minister of Defence Production. Do you think that any country in the world would consider Canada as a non-aligned country because of our geographic situation even if we did withdraw from NATO and NORAD?

• 1205

Mr. Golden: I do not think there is the slightest chance that anybody would think that Canada is non-aligned. I certainly do not think so myself.

Mr. Laniel: This means that in your mind, relative to the promotion of peace and participation with the United Nations in peace-keeping forces, or other objectives of that kind, our image would not be changed in any way whether or not we did withdraw from these alliances?

Mr. Golden: No, I do not.

The Chairman: May I ask a supplementary?

Mr. Laniel: Yes.

The Chairman: Do you regard Mexico as a non-aligned country, Mr. Golden?

Mr. Golden: Yes.

The Chairman: May I just ask why you feel that if we withdrew from NATO and NORAD we could not be considered as non-aligned whereas Mexico to the south is in your view, a non-aligned country?

Mr. Golden: Because I think we are very active in many of these areas and we will continue to be active, whereas Mexico is not, and has not been. These situations can change very radically and I might be wrong about Mexico, but that is the way I look at it.

Mr. Laniel: I have come to the same conclusion. Therefore, if we are to look at our defence policy and participation in our alliances I think we should bear in mind the very important economic factor. Our defence-sharing program is mainly with the United States. What proportion of all our sharing programs with all of our allies would be directly related to the United States in comparison to other NATO countries?

Mr. Golden: Because of geography and because of the very close relationship between Canadian and American industry, not in this field, but in general, the over-

whelming proportion of these transactions is between Canada and the United States. There are some with Great Britain, France and Germany, but they are relatively modest compared to the Canadian-United States one, for obvious reasons.

Mr. Laniel: Can you tell us what proportion of our gross national product these programs would represent. I am trying to discover what would be the influence on the Canadian economy if, tomorrow, we were not to break relations with the United States but at least to isolate ourselves to a point where we would have to establish our own military force and procure for ourselves different things from outside. Because of that isolation would we put ourselves into a position where we would lose advantages that might affect Canadian industry?

Mr. Golden: Indeed, we would lose very considerable advantages, but I could not give any quantitative or qualitative assessment.

As I said earlier, I certainly do not believe that military or foreign policy should be motivated only by these considerations, but I do believe they are considerations which must be taken into account, among many others, in these re-examinations.

Certainly in many industries access to United States technology—access to modern American advances—is very important if you wish to stay competitive world-wide. I suppose there are other ways of doing these things but they are very difficult and very costly and very time-consuming.

Mr. Laniel: You said that Canadian-United States relations are paramount but do you feel that within NORAD our participation is satisfactory, perhaps not militarily—you said you were not a military expert—but in the decision-making process?

Mr. Golden: I think you really should ask somebody else about that. On the face of it,

•1210

we have very senior military officers participating. I have no personal knowledge of how consultation takes place, on the political level, but on the levels of participation I think this must of necessity vary with changing world situations and changing technology. We all know that a whole new round of AWACS and other things are now being talked about which, I assume, would be for intergovernmental discussion on what role, if any,

Canada should play, bearing in mind our very limited resources in comparison to those of the United States.

Mr. Laniel: One last question: Certain people say that because of our geographical situation next to the United States we would retain many of the advantages we now benefit from even though we did isolate ourselves in neutrality. But do you feel that, proportionately, Canada right now is, and for the past 10 years has been, receiving more advantages than has Mexico which is also a neighbour of the United States? And would the reason for this be that we are in different alliances and cooperating closely with the United States either in NATO or in the defence of North America?

Mr. Golden: I suppose that is so. I do not wish to offend the Mexicans, but it seems to me that we are somewhat more advanced as a technological, industrial nation than is Mexico as yet. That, too, not only has an effect on Canadian-American relations but affects what we hope to achieve through Canadian-American relations—what is it they call it?—the revolution of rising expectations. The sort of industrial backup that would have been quite acceptable to Canada before the onset of World War II would be an absolute nonsense in 1969.

Mr. Laniel: Thank you.

The Chairman: Mr. MacDonald, and then Mr. Anderson.

Mr. MacDonald (Egmont): Mr. Golden, I think you gave us the key to your presentation some time ago when you suggested that the relations between Canada and the United States really are paramount to your consideration and to the brief you have presented today.

Although, starting from that point, you could end up with a number of different positions, you have ended up in one particular position which accepts that not only should we act extremely closely in defence matters with the United States, but, as has been pointed out this morning, even defer to the United States on occasions when we might disagree on the importance of a certain defence instrument or posture.

If I may go to the basis of your considerations here it seems to me that the essence of your philosophy, if I may call it that, is in

the first paragraph on page 4 where you say, in the third line:

...But on the essential things of life they hardly differ at all...

Do you think that the foreign policy aims of Canada and the United States, perhaps proportionate to the difference in magnitude of the two powers, are in a sense the same?

Mr. Golden: That is a very difficult question. When I talk about the essential things of life I am really talking about the freedom of the individual living in a democratic society, and so on. I assume that the paramount aims of national policy in both the United States and Canada are peace and tranquility.

These, of course, are the paramount aims of all settled communities. Peace and tranquility do not sound so sensible to a nation which feels that the events of the last hundred or two hundred years have dealt with it harshly and that is why, in my view, it is so easy to get a vote for peace and tranquility in North America and so difficult to get a vote for peace and tranquility in some other parts of the world.

• 1215

But certainly I would accept that basically we desire a peaceful world order and that is the number one foreign policy objective of Canada and that is the number one foreign policy objective of the United States. I think once you move away from that there are undoubtedly differences between us but I do not regard those differences as going to the quality of life or the essential objectives; they go rather to means and there we come right back to what you said, bearing in mind the difference in size and responsibility. You cannot, in my view, push this to one side.

The pre-occupation with "communism" which one finds in the United States and not quite so much in this country is, I think, because the United States sees its responsibilities globally and also because of certain historical reasons, but I really think that in those areas you are talking with countries which have different missions in the world and that is why they do different things.

Mr. MacDonald (Egmont): Let me stay on this just for a moment. You have indicated that in the United States there is preoccupation or concern with communism, that essentially while Canadians may not share it to the same degree the reason really is because of

magnitude and not because of an essential difference in outlook or in its concept of the danger of communism; we can actually use communism as such because we realize now we are referring to the number of states which within themselves have a different foreign policy view generated out of their own communist ideology.

Mr. Golden: That is right.

Mr. MacDonald (Egmont): Are you, in fact, just saying it is a question of magnitude and not some fundamental difference in view?

Mr. Golden: I would agree with that.

Mr. MacDonald (Egmont): Would you say, then, that for a country today one of the essential criteria of national sovereignty is its ability to devise its own foreign policy and also to be ultimately responsible for its own national defence?

Mr. Golden: Yes, but the two really are not the same, unfortunately. Devising a foreign policy is—I was going to say simple, but obviously it is not simple with committees devoting many, many hours to this but it is relatively simple to devise a foreign policy compared with the complexity of making it effective, even what you and I said a minute ago about peace and tranquility.

How do you impose peace and tranquility? Is it going to be a *pax Romana* or a *pax Britannica* and now a *pax Americana*? I guess not—at least, I hope not. The modern world just does not permit that sort of thing. You said, to be responsible for your own defence but who today, what country today, can be responsible for its own defence?

I assume that one of the major considerations motivating the Russian invasion of Czechoslovakia was defence. There were others, I have no doubt, so even the USSR thinks it is not capable of looking after its defence itself without having reference to what goes on around it and that, it seems to me, is where the real difficulties come in. You can have a foreign policy or defence policy but how do you make it effective by yourself?

Mr. MacDonald (Egmont): If I may paraphrase your brief and I think what has been the essence of your testimony here today, there is, in fact, a great deal more that we have in common with the United States than we realize and this must be a first consideration in the development of any kind of

defence policy in this country. I am just wondering whether you foresee the day when, not only for defence purposes but perhaps for reasons of improving the economic outlook and so on, there could be a full-scale economic and political union with the United States?

Mr. Golden: Oh, no; that is why I argue all this so strenuously. I am violently opposed to that. I do not know why I should be, but I am.

Mr. MacDonald (Egmont): I do not know why you should be either in terms of your presentation.

• 1220

Mr. Golden: But I am; I guess I have not got my idea across. It is *because* I want Canada to be independent, it is *because* I believe in a sovereign, independent Canada that I want these things. It is because I do not want American airplanes swarming over the Canadian sky.

Mr. MacDonald (Egmont): But they are today—now.

Mr. Golden: I think having them do it as a result of an agreement freely entered into that we will do some things and they will do some things is one thing, and having them do it as if there were no Canadian agreement at all is quite a different thing.

Mr. MacDonald (Egmont): I think you are putting an interpretation on what I said that is not quite correct. I would not see it as Canada's being some kind of cauldron on the United States. I am just simply carrying what seems to be your progression of thought to not only the next step but perhaps the next number of steps by saying that if Canadians are really going to become active and effective in the North American continent rather than just a very small partner, which is what we will be today, we would enter into the full life stream of the United States; we would presumably be 10 more states. An extension of what you are advocating seems to be that we form the next 10 states of the United States and perhaps in that way become even more actively engaged in the development of North American defence policy.

Mr. Golden: I can only make two comments on that. I do not believe that anything I have said leads to the inevitability of such a conclusion or, I believe, in the desirability of

such a conclusion. I do not believe either would be warranted.

Mr. MacDonald (Egmont): Well, having explored that a bit, let me ask you another question. I forget how you put it—something about we should be aware of the United States and of their interest—but I wonder whether you have any thoughts on whether or not Canada, because of its size and because, as you said earlier, of its technological sophistication, could play any particular role either in its defence posture or foreign policy that would be a particular asset to the United States.

In other words, has the United States discovered, perhaps in the last decade particularly, that there are certain kinds of things it cannot do, simply because of its size and because it is one of the centres in terms of polarity in this period, that the Canadian government might, in fact, do that would be extremely useful and valuable to the American Government?

Mr. Golden: I cannot think of any examples offhand, but I do not see why such a scenario would be inherently improbable at all; I think it is quite possible. There are very few things in the industrial and technological fields that the United States cannot do but there are a lot of things it might not be economic or sensible for it to do. This is the realization that we came to in Canada some years ago in certain fields, and I think joint Canadian-American activities in some of these fields have advantages not only for Canada but for the United States. In my experience if joint enterprises do not do something for both sides most of them do not last very long. They ought to have some meaningful attraction to both members of the partnership.

Mr. MacDonald (Egmont): Do you think in terms of image or impression that when Canada does something in a part of the world such as the continent of Africa or in parts of Asia it is regarded much differently than the United States is regarded? Do we have a different image for or impression on these people, do you think?

Mr. Golden: The continent that you have chosen is one with which I have no personal experience at all. I have never been to Africa, but in those parts of the world where I do visit frequently I do not find that people have too much difficulty in making up their

minds that Canadians are different from Americans and have different roles.

Mr. MacDonald (Egmont): On what basis, though?

Mr. Golden: I think they accept the fact that we are a sovereign, independent country and that we have independently come to the conclusion that there are a lot of things the Americans are doing that make sense and we want to be associated with them. I do not believe that because we agree with the United States that necessarily means we are being subservient or not exercising independent judgment.

• 1225

Mr. MacDonald (Egmont): May I just ask one final question? The question is short, but perhaps I may be asking for too long an answer, but do you think that the military-political situation has really altered substantially since the late nineteen-fifties?

Mr. Golden: I suppose it has altered; everything changes. I suppose what you are asking me to address myself to is whether it has altered in any meaningful way. Certainly the economic recovery of Europe and its capacity to participate in its own defence has grown with astonishing rapidity in the last 10 years. I would regard that as a meaningful change. I would regard the ability of the nations of Europe and their desire to contribute to their own defence has altered in a meaningful way in the last 10 years.

Mr. MacDonald (Egmont): If I may just add this as a sort of supplementary, are there areas in which the threat has altered—if I can use that term—the potential military threat, say, to this country? Has it altered or shifted from one area of the world to another?

Mr. Golden: I am not an expert Kremlin-watcher or Sinologist or whatever they call them these days and my views are no more valuable than any average citizen's. Every time I think things are getting better something horrible happens and makes me reconsider. I do not know whether other people have that experience or not.

The Chairman: Thank you. Mr. Anderson, and then Mr. Ryan.

Mr. Anderson: Mr. Golden, I would like to congratulate you on your brief and lucid

statement. It contrasts sharply with some that we have had quite recently, but there is one aspect that I am afraid is not too clear to me and that is in paragraph 4 of page 4 which reads in part:

4. As far as independence is concerned, only a Canada which shares in North American defence and which has forces it can commit to such defence can influence in any important way, American policy.

While I will certainly accept that as a preliminary statement, it seems to me that if we devote a certain amount of our defence expenditure to North American defence in the agreements as you suggested we should do we should also at the same time attempt, perhaps, to play some part in Europe in NATO which would also aid, if you like, in the general defence of the North Atlantic area. In my opinion, a direct attack in Europe or a war in Europe would probably mean war in North America as well. It would quickly become global and I cannot see why you think that our influence is directly dependent upon the amount that we contribute in North America.

I would have thought that our influence would be directly dependent on the amount we contribute not only in North America but also in Europe, and there is not much difference one way or another where we put our troops from this point of view.

Having said that, of course, I come to the next part of my own private thesis which is that perhaps for specifically Canadian interests we should make a fairly large contribution in Europe where we have the opportunity of working with other nations of similar background, nations with which we have ties other than the United States and thus, in concert with those nations, perhaps have more influence on American policy than we might have in a strictly bilateral NORAD-type arrangement, North-South.

I am sorry this is such an involved question but I am really explaining an attitude which I would like you to comment on. You stated on page 3 in paragraph 1 that our contribution in North America need not be 100 per

• 1230

cent or even close to that, but it must be a great deal more than zero. I will agree with that, but it seems to me that once you assume that we are only going to carry out something like 30 to 50 per cent of the actual defence of North America, and the Canadian zone, once

having decided that it does not make much difference whether you put in 30 per cent or whether you put in 50 per cent, you are only going to do a small amount anyway. You want to make a substantial contribution, and as far as the Americans are concerned I cannot see how they are particularly concerned whether we put in either 30 or 50 per cent, provided we play a role in Europe which again is in the common North Atlantic interest. This is not a very good question, sir, but I cannot see why you have suggested that our influence on the Americans and our influence on and ability to affect American policy is entirely dependent upon what we do in North America. It seems to me that it would be what we do in both areas.

Mr. Golden: On the contrary, I think it is a very good question. Of course, this is the sort of thing that one runs up against all the time. You have limited resources and you have to try to decide what to do with them. First, when I talk about only a Canada which shares in North American defence, and which has forces which it can commit to such defence, can influence in any important way American policy, I mean American policy in North America. I do not mean American policy locally. That brings me to the difficulty I have in this respect. When you talk about independence and sovereignty you can only relate it to Canada as a physical thing. When you talk about Canadian forces in Europe you are talking about a contribution to an alliance where we may or may not play an appropriate role, depending on one's views. There is no question about it, the United States is most anxious we should play that role and the reasons are well understood.

Perhaps what is not so well understood, in my view, is that there are more compelling Canadian reasons than there are American reasons why we should play an appropriate role in North America. It is not important to their sovereignty what happens in northern Quebec or northern Ontario, it is our sovereignty that is involved, and that is why I am making this distinction. I agree with you that it would pay dividends, in the sense of having an influence on policy, if we had appropriate military forces in Europe, but my assessment of doing that and all the other things that we are talking about doing is that it would require a larger defence budget than we have today. If such is the decision, so be it. I have no objection at all. In fact, I think that is

fine. I think perhaps the Canadian contribution to defence is getting smaller than it should be in relation to the obligations we might properly assume, I do not know. I have no objection to what you have said at all; it is just a question of how you get all this in. When I talk about sovereignty and independence I am quite aware of the fact that many Americans have said—whether they speak for the United States government or not, I do not know—“Do not worry about what goes on in NORAD. You stay in Europe”. I think that is quite a defensible American view. However, I regard it as an indefensible Canadian view. To me it is important for Canada that these things not happen, whether it is important to the United States or not.

Mr. Anderson: So you therefore think that the political advantages that accrue for Canada may be direct advantages by working with European nations and the ability we have to work in concert with those nations on the United States is not perhaps more valuable than for instance, increasing the number of Canadian aircraft in Canada and decreasing the number of American. In other words, we gain more by increasing our contribution from my hypothetical figures of 30 per cent up to 50 per cent than we would lose in Europe?

Mr. Golden: I take it we are definitely speaking in hypothetical figures because I doubt that we would make anything like that contribution to North American defence, or that we are ever likely to.

I cannot quarrel with your assessment. I believe in the importance of an inviolate Europe. I believe that it is important to Canada that Europe not be overrun. I believe that Canada should remain a member of the NATO alliance. Of course, circumstances may change and it might be vital that we make a major military contribution, but I do not see it today in relation to the forces and resources which appear to be at our disposal. It may be there are many aspects of government policy in this regard that I do not understand, and this would not be the first time. However, I do not see much evidence that a major increase in the defence budget is in contemplation, and in relation to what can be done with a somewhat depreciated dollar I put a greater importance, for Canadian reasons, in these fields. I would not downgrade the advantages that can be gained by Canada

disposing of forces in NATO. I just do not see how one does all these things.

• 1235

Mr. Anderson: I have a final question. We have been told that the equipment we have in NATO is not usable in North America, it is of a type and nature which is designed for European use only. Do you then feel that we would be involved in a fairly extensive re-equipment program if we decided to bring these troops back and if we decided to bring the air division back?

Mr. Golden: All roles require re-equipment in what, to the people who have to put up the money, seems a lamentably short period of time. When I talk about disengagement in Europe, I am assuming that this would be done in close concert with our allies. It might take four or five years, by which time that equipment would have to be replaced whether you left Europe or not. I do not think these decisions solve the very difficult problems of having to replace equipment. What you then have to concern yourself with is the kinds of equipment. I do not think replacement is a matter that really solves any of these things; all equipment has to be replaced sooner or later.

Mr. Anderson: Thank you very much, sir.

Mr. Ryan: Mr. Golden, like other members of this Committee, I was very gratified when I read your written submission and I compliment you on it. Mr. Anderson has opened an area in which I was interested. With respect to the emphasis you have placed on Canada's defence role in North America, it seems to me that you are placing a little too much emphasis on it. I admit it is our prior interest but at the present time, having regard to the world situation and the circumstances around us, if we are not getting a free ride at least we are—I would submit to you and ask you to agree with me—getting a cheap ride in North America. Would you agree with this?

Mr. Golden: Oh yes.

Mr. Ryan: At the present time?

Mr. Golden: Indeed this is so, and in the very nature of things it is inevitable.

Mr. Ryan: Yes. We do not need 600,000 men under arms as Taiwan does, for instance. We have an army, navy and air force of somewhere around 100,000. We do not need large

conventional forces on land or in the air in Canada. Is this not so?

Mr. Golden: Yes, but "large" could be taken to mean many things. However, if I understand the intent of your statement, I agree with that.

Mr. Ryan: In fact, there is only a certain amount of attention that we need pay to our internal security. We have a friendly neighbour to the south. There is very little chance now or in the foreseeable future of lodgements by conventional forces. In fact, our main fear is a nuclear attack, is it not?

Mr. Golden: As I understand it, yes.

Mr. Ryan: Yes. So with this in mind should we not direct our attention to try to prevent a nuclear war mainly between the U.S.A. and Russia? Is this not our main concern as we live in Canada today?

Mr. Golden: Yes, I believe so.

Mr. Ryan: With this in mind, should we not then turn most of our attention to and put most of our money behind the proposition that we want peace, we want stability, and particularly in the area where war would be most likely to break out, which I suggest to you is along the NATO wall in Europe. I am talking about nuclear war.

Mr. Golden: I hope you do not misunderstand me when I say I really prefer not to go along with that last part. I am not saying it is not correct, but...

Mr. Ryan: I do not mind if you qualify it or disagree.

• 1240

Mr. Golden: I do not mind disagreeing either if I know what I am disagreeing about, but I cannot think of anything that I want to substitute for what you said, except that I am not sure but that in my own mind I think of that war as more likely to occur over the Berlin Wall. I suppose the archives may not be opened, if ever, for another 50 or 100 years, but was not the closest we came to a nuclear confrontation that which took place between the two great powers over Cuba, which is a very long way from the Berlin Wall.

Mr. Ryan: Of course, I might disagree with you a bit on that one. I do not think it was as big a confrontation as has been made out. I

think it was in the American ambit of influence and that any reasonable country in Russia's position would pull out of that. I think we would have been in far more trouble if it had been in Yugoslavia or Austria, or some place like that. However, it certainly pointed up to us the grave dangers, of course. You are now limiting my question to the Berlin Wall and I had in mind the whole of the NATO front, like a dike there, and what I am concerned about at the present time is pulling the finger out of that dike. It seems to me that it is our gravest concern.

Mr. Golden: In essence, I will not quarrel with any of the things that you have said.

Mr. Ryan: Mr. Golden, if you have thought about it, what would your views be in connection with Canada assisting with an anti-ballistic missile system?

Mr. Golden: Of course, as far as money is concerned, these things come very high and I have no access to this class of information. I have no knowledge about what the Americans may have proposed to Canada, if anything, nor do I know, except from what I read in the newspapers, what requirements there would be for Canadian ground stations or Canadian air space. I would be inclined to lend a sympathetic ear to a suggestion that we co-operate within our resources if, on analysis, it turned out that this was the best or the most effective way of making the American defences what they would hope them to be. I have many ifs and qualifications there because I just do not know enough about it.

Mr. Ryan: Thank you, Mr. Golden.

Mr. Cafik: Mr. Chairman, there was an article this morning in the *Globe and Mail* written by Mr. Bruce Hutchison which gives rise to a question that I would like to ask. In an interview with some unknown but, I gather, important personage in the United States whom he claims may well become a President of the United States, Mr. Hutchison quotes him as saying in respect to our possible withdrawal from NATO:

If Canada actually thinks of getting out of NATO it is an insult to my country. No, much worse than an insult. It would be a betrayal. Our people would never forgive it. And believe me they would express their hurt by means which would hurt Canada far worse than you can imagine.

I do not know if you subscribe to that view or whether that view is a proper assessment of the reaction of important people in the United States.

Mr. Golden: I do not subscribe to that view at all, and I do not believe Canada should pay any attention to views of that kind.

Mr. Cafik: You do not feel that they would express their disapproval in ways that would hurt us substantially?

Mr. Golden: I read that article this morning and I was outraged by it.

Mr. Cafik: Thank you. My second question—and I hope it is in order, Mr. Chairman, it is a matter of information more than anything else—concerns your background and your office as Deputy Minister. You were the Deputy Minister of Defence Production from 1954 until 1962. Is that correct?

Mr. Golden: That is correct.

Mr. Cafik: You were serving as President of the Northern Ontario Pipeline Corporation simultaneously with that function?

Mr. Golden: In our family that was known as my Sunday morning job.

Mr. Cafik: I see. I presume that means that you were the Deputy Minister at the time of the scrapping of the *Avro Arrow*. Is that correct?

• 1245

Mr. Golden: That is so.

Mr. Cafik: I wonder if you care to make any comments in this regard as to the advisability of that move in terms of our defence posture at that time, or even now?

Mr. Anderson: A question of order, Mr. Chairman. I do not think the *Arrow* affair, should be raised at this point. I do not think we should follow this argument.

Mr. Cafik: Why not? It would depend on whether the witness would care to answer. If he would rather not answer, that is fine.

The Chairman: Mr. Golden, if you prefer not to answer, there is no question of you having to.

Mr. Golden: I have no objection to answering. Of course I was Deputy Minister of Defence Production, but one must not overestimate the responsibilities of Deputy Minis-

ters; they do not decide whether *Arrows* should be scrapped or not. I really cannot give you an informed view of whether the scrapping of the *Arrow* made a significant change in the defence of Canada.

But in relation to the resources that we were devoting to defence at the time, I thought then and still think that the decision, though regrettable, was the right one.

Mr. Cafik: Thank you.

The Chairman: Mr. Harkness?

Mr. Harkness: Mr. Golden, starting with your assumption that the defence budget is going to remain practically where it is at the present time, or in that general range of \$1.5 billion to \$1.8 billion a year, would you consider that from a cost point of view alone, the military contributions which we make at any particular time—we will say at the present time—are determined to quite an extent by the hardware which we already have? In other words, it is far too expensive a business to suddenly decide to change the roles which we are carrying out now and, as a result, be required to completely re-equip our forces. From the straight practical cost point of view, this just cannot be done.

Mr. Golden: I think that is a fair statement, yes.

Mr. Harkness: And therefore the only way in which we can, we will say, change the contributions which we are making is over the course of years as the equipment we presently have becomes obsolescent.

Mr. Golden: Yes, I agree with that. I also would like to repeat what I said earlier, that I am a believer in alliances and in sticking by our pledged word. You know, when I downgrade as I do NATO because of these other factors, I am not suggesting that we ought to get out tomorrow or something like that. This ought to be done properly in consultation with our allies.

Mr. Harkness: Of course, the contributions which we have made to both NATO and NORAD have changed over the years.

Mr. Golden: Yes.

Mr. Harkness: I think it is inevitable that they will continue to change over the years. But I think this is one of the facts that we must bear in mind, that the particular military contributions we are making at the

moment are, to a certain extent, wired on because of the capital costs we have already undertaken and the money that we had invested in the equipment presently on hand.

Mr. Golden: I am sure this is so.

An hon. Member: What about the *Bonaventure*?

Mr. Harkness: It is not only the *Bonaventure*; it is all the military equipment we have. It is the CF-104s in Europe; it is the heavy equipment of the brigade in Europe. If you are going to do away with the heavy brigade in Europe, then that particular role will go on to, we will say, a light brigade which would have to be equipped with a great deal of military transport, air transport, helicopters and so on. It would involve several hundred millions of dollars of new expenditure immediately. And this is a thing which, if our military budget is not going to be very materially increased, we cannot do except over the course of years. It has to be a gradual process.

The Chairman: Thank you, Mr. Harkness.

Mr. MacLean: A supplementary question here just for clarification. I take it that when you say you believe we should reduce our commitment to NATO, you say so on the basis not that our contribution is useless or unwise, but that we cannot afford to continue it as well as other more important commitments?

Mr. Golden: That is right. I do not say anything about it being useless or unwise. I do not have the military background to comment on its efficacy, but everybody who does have this background regards the contribution historically as of top-notch calibre.

● 1250

The Chairman: Mr. Golden, I wonder if I could ask you one or two questions, if the other members have no further questions.

In reply to a question from Mr. Ryan, you agreed that a nuclear attack was the main danger to Canada. Would you therefore agree with the views of Mr. Gellner, Dr. Solandt and the two witnesses from the Hudson Institute who were before the Committee to the effect that we should be doing more than we are doing in the way of protection through civil defence, whether or not we retain our alliances? Or do you have any views on that subject?

Mr. Golden: I am ambivalent on this subject. I personally have never done anything in this regard even when I was a civil servant at the time when there was some pressure to do things like that. And yet I read the testimony to which you refer, and I think they do make a good case for some greater activity, but how great I think is very difficult to say.

The Chairman: In your earlier testimony today, Mr. Golden, you referred to the great influence Canada had during the war and immediately after the war, and you indicated that you felt perhaps some Canadians had not become reconciled to playing the lesser role which our present power and position in the world would make appropriate.

Perhaps you may not wish to answer this question or even comment, but in your personal opinion would this apply to officials in the Department of National Defence, for example, or in the Department of External Affairs who have a particular personal interest in maintaining an important position in the world.

Mr. Golden: I did not have officials in mind when I said that. I really could not comment on that.

The Chairman: No. In your view, Mr. Golden, is the degree of independence which Canada can exercise in external affairs or in matters of defence policy—recognizing that no nation can have complete independence—limited by continental arrangements such as the defence production agreement, the automotive agreement, the continental oil policy, and economic arrangements of that nature?

Mr. Golden: Basically, I do not believe so. I do not believe that basically this is so. I believe that Canada, despite the fact that it has all these arrangements, is still quite capable of having an independent foreign policy.

The Chairman: If Canada did wish, in a particular case, to adopt an independent line vis-à-vis the United States, you do not feel that the existence of these continental arrangements would impose undue penalties upon Canada?

Mr. Golden: I think if we denied that we had a commonality of interest with them, then of course these other things would be imperilled, which I find unthinkable. But to differ or disagree on a particular issue—I cannot see why that should in any way inhibit us.

The Chairman: Do you know, Mr. Golden, whether the United States is now doing for Canada on our territory anything in the way of defence which we could do for ourselves if we diverted our efforts from other fields? For example, do you know whether the United States is providing for the air defence of Western Canada? Is this something which, in your view, we could, if necessary, undertake ourselves?

Mr. Golden: You have chosen the most difficult one of all. Because of historical and geographical reasons the Western Canada problem has always existed, even at a time when we disposed of very substantial resources, at a time when we were spending 6 or 7 per cent of the gross national product on defence, rather than the 2.5 per cent or whatever it is that we are doing now.

I am very much out of date, but I would be surprised to find that there were not several things that they are doing that we could do if we were prepared to do it and pay for it.

• 1255

The Chairman: Is it possible that with the money saved from a decrease in our NATO expenditures, we could avoid being condemned for taking a free ride by substituting defence of our own territory where we are not now doing so.

Mr. Golden: I think there are considerations like this. And there are also considerations to be borne in mind that the savings soon cease to be savings. All they do is make it possible for you to keep up with the rising cost of everything.

The Chairman: Mr. MacLean, I believe you have a supplementary?

Mr. MacLean: I have a question which, I am afraid, is outside the ambit of the brief. I hesitate to ask it, but perhaps I will anyway, and if the witness wants to comment he may.

During your remarks you said that the United States was preoccupied to a greater extent than Canada with the threat of world communism, or words to that effect. Is it not possible that it is we who are in error here and that we are lulling ourselves into a sense of false security, thinking that activities of this sort are not as important as some take them to be. Is it not possible that while we are here deciding how to guard the front door, subversion is coming in the back door in a way which will, in the end, be more destructive than a direct military threat.

Mr. Golden: You may be very right. I find it difficult to quarrel with what you are saying. But I personally, speaking just for myself, sometimes find it a little bit hard to swallow when what I would have regarded as a movement of social reform is immediately tagged by some people as being communist. That is what I meant. Now maybe I am wrong. I am not quite as ready as some other people I know to do that, and I could be very wrong, but that is just the way I am.

Mr. MacLean: On the other hand, to get down to cases, what defence has the average kid straight out of high school against the kind of plausible but, in my judgment, completely erroneous evidence that we were presented with by our last witness?

Mr. Golden: I do not think I should comment on that.

The Chairman: I have one last question, Mr. Golden, if I may. Certain witnesses have indicated that our being part of NATO and NORAD gives us greater influence and prestige than we otherwise would have. In other words, our defence contributions in effect buy influence and prestige, if that is a fair way of putting it. In your view, and I realize it can only be a personal view, is this a strong argument for continuing in these alliances?

Mr. Golden: I think the prestige argument is nonsense, and I would hope that we do not spend a nickel for prestige. Influence, of course, is terribly important depending on what you want to use the influence for. If it is

influence to further Canadian national needs and interests, then I am all in favour of it.

The Chairman: Do you think that our defence dollars to buy that type of influence which does, in fact, further our Canadian national needs?

Mr. Golden: They certainly can. Whether in every case they do is a question of judgment, but I think they certainly can.

The Chairman: Do any members have further questions?

Mr. Hymmen: Mr. Chairman, I have a supplementary. I think Mr. Golden mentioned that he thought that Canada's military commitment in NATO could be reduced over a period, and I believe he added, in full consultation and co-operation with present allies. If there is anything to the so-called domino theory, I presume that this would play a very important part in the consideration.

Mr. Golden: Yes, but I must say that I find great difficulty with the domino theory in Europe. If the European countries themselves are not interested in defence I find it hard to see how we with a few thousand people are going to make that defence effective. That is the difficulty I have with the domino theory in Europe.

The Chairman: Gentlemen, if there are no other questions then, on your behalf, I would like to thank Mr. Golden most sincerely for his evidence this morning. Mr. Golden: thank you very much.

APPENDIX LL

CANADIAN DEFENCE POLICY AND THE UNITED STATES

The purpose of this short paper is to make several observations about Canadian defence policy and Canadian/U.S. relations.

Although there are cultural, linguistic, ethical, religious and historical reasons for the close relations which exist between the U.S. and Canada, the two most compelling reasons are geographic and economic. The geographic one can't be changed because of physical laws, and the economic one creates its own physical results as time goes on.

Relations between Canada, or rather the colonies which ultimately came together to form Canada, and the United States, were not always peaceful, and hostile acts occurred on both sides of the border. Although nothing is certain, and prophesy is dangerous, I assume for purposes of my argument that the possibility of similar events occurring in the future are so remote as not to require consideration.

Certain basic facts enter into the formulation of any Canadian/U.S. equation. Some of the most important are:

1. The United States is a large world power, exercising great influence not only on her own behalf, but also is the leader of the "free world", or the "Western" world, or the "democratic alliance". There are objections to all of these words, but they nonetheless represent a considerable body of truth.

2. Canada is a relatively modest power in world terms and does not exercise special or extraordinary influence, or have a leadership role. In any alliance or special relationship between the U.S. and Canada, the different strength and global responsibilities of the two countries are bound to have some effect.

3. Canada shares many basic beliefs with respect to government, relation of state to man, relation of man to man, and rights of the individual, with the United States. These beliefs necessarily condition the way in which Canadians react to certain foreign policy or defence issues.

The United States, in the course of its leadership role, and as a result of its confrontation with the U.S.S.R., takes the view that it must guard against all reasonable defence contingencies. As a consequence of this, certain measures of North American defence are important to her. I suggest that if they are important to her, they should also, unless they are manifestly against our own interests, be of importance to us in Canada. In other words, Canada should play a role in defensive measures considered important by the U.S., even if our assessment of the necessity of such measures should be at variance with that made by the U.S. I do not mean by this that Canada should surrender her right to make an objective appraisal of each situation as it comes up—what I do mean is that Canada in making such an appraisal should consider the role played and responsibility borne by the U.S.

No power the size of the United States and exercising its leadership and responsibility will ordinarily be prepared to permit its security to be adversely affected by the action or inaction of a close neighbour. Does this mean that if Canada doesn't co-operate with the U.S., we will be over-run and occupied? I don't suggest that at all. But there are an infinite number of possible actions that could be taken by the U.S., which would fall between the two extremes of doing nothing at all to counteract Canadian refusal to participate in joint defence undertakings, and military occupation.

Canada should play an appropriate role in North American defence because of reasons of national sovereignty, because of reasons of national interest, because of reasons of self-respect, and because of reasons of independence. I should like to say a few words about each of these.

1. As far as national sovereignty is concerned, there are several courses Canada can follow but each one requires forces sufficient to give effect to the sovereignty we claim. It need not be 100% or even

close to that, but it must be a great deal more than zero. If we join in common efforts with the U.S., we should have some forces to play our part. If we don't want a common effort, then we need forces to do what has to be done alone. If we want to be neutral, we need forces to establish this neutrality.

2. As far as national interests are concerned, Canadian and U.S. views on many subjects differ, and on some subjects differ markedly. But on the essential things of life they differ hardly at all, and Canadian national interests call for a close co-operation with the U.S. in defence of those interests.

3. As far as national respect is concerned, this is a matter about which it is difficult to be exact or quantitative. I feel, but cannot prove, that Canadians do not want, and in fact would reject the idea of a "free ride", so called.

4. As far as independence is concerned, only a Canada which shares in North American defence and which has forces it can commit to such defence can influence in any important way, American policy. An independent Canada which has its own ideas on policy and strategy needs to be a partner or participant, not an onlooker, if it wishes to make its ideas effective.

There are other defence roles which it is proper and appropriate for Canada to perform. It is the contention of this paper that none of them is as important as the defence role which Canada can and should play in North America. If resources permit, or if the international situation so requires, then other

roles can be added, but not at the expense of the North American one.

DAVID A. GOLDEN

Mr. Golden was born in Sinclair, Manitoba, on February 22, 1920. He attended the University of Manitoba and University of Manitoba Law School, and graduated with the degree of LL.B. in 1941. Appointed Rhodes Scholar in 1940.

Mr. Golden enlisted in May 1941 in the 1st Battalion, The Winnipeg Grenadiers, and served in Canada, Jamaica and Hong Kong. He was a prisoner of war in Hong Kong from December 1941 until September 1945. He was discharged from the army in December 1945, with the rank of captain and adjutant.

Mr. Golden was married to the former Molly Berger of Estevan, Saskatchewan, in September 1946, and they have three children; two sons and one daughter.

Mr. Golden was appointed Deputy Minister of Defence Production on September 30, 1954, and became President of the Northern Ontario Pipeline Corporation on June 7, 1956. Resigned from Government service on appointment as President of Air Industries Association of Canada on July 1, 1962. Appointed Deputy Minister of Industry on July 25, 1963. Returned to position as President of Air Industries Association of Canada on July 1, 1964.

Mr. Golden is Chairman of the Board of Governors of Carleton University, Member, Ottawa Advisory Board, Royal Trust Company, Past President of Ottawa Canadian Club, and a Director of Atomic Energy of Canada Limited.

Hugh R. Stewart,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

(Text)

TUESDAY, February 25, 1969.
(44)

The Standing Committee on External Affairs and National Defence met at 11:00 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Anderson, Barrett, Brewin, Cafik, Fairweather, Forrestall, Gibson, Groos, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, Lewis, MacDonald (*Egmont*), MacRae, Marceau, Nowlan, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Thompson (*Red Deer*), Wahn, Winch—(26).

Also present: Messrs. Buchanan and Hymmen, M.P.'s.

Witness: Professor John W. Warnock, Department of Economics and Political Science, University of Saskatchewan, Saskatoon, Saskatchewan.

The Chairman gave a report from the Subcommittee on Agenda and Procedure, concerning the timing of a Report to the House and the itinerary for the trip to Europe. The Committee agreed to defer discussion on these points until an *in camera* meeting of the Committee at 8:00 p.m. this day.

Copies of a revised itinerary for the European trip were distributed. Also distributed were copies of five articles dealing with NATO and foreign policy entitled as follows:

To stick with NATO, or live alone with the U.S. — Woodside (*The Observer*)

New course in foreign policy — Lewis Hertzman

The big gap in the great NATO debate — Thomas A. Hockin, *Globe and Mail*, Friday, February 14, 1969

NATO Is Dangerous, Let's Quit — Anton Vogt, *The Vancouver Sun*: Thursday, January 9, 1969

A New Atlantic Role for Canada — by Roy A. Matthews, *Foreign Affairs*, v. 47, January 1969.

The Chairman introduced the witness, Professor John W. Warnock, who made an opening statement.

Members questioned Professor Warnock about his views on Canadian defence policy.

The Committee agreed to print Professor Warnock's advance presentation entitled *Canada's Role in North American Defence*, and his biography, as an appendix to this day's Minutes of Proceedings and Evidence (*See Appendix mm*).

Members completed their questioning and the Chairman thanked Professor Warnock for his helpful testimony.

The Committee adjourned at 1:30 p.m., until 8:00 p.m. this day when there will be an *in camera* sitting.

EVENING SITTING

(45)

The Standing Committee on External Affairs and National Defence met *in camera* at 8:00 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Brewin, Cafik, Fairweather, Gibson, Groos, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Legault, Lewis, MacDonald (*Egmont*), MacLean, Macquarrie, MacRae, Marceau, Nowlan, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch—(27).

Also present: Messrs. Buchanan and Roberts, M.P.'s.

Members of the Committee met *in camera*, to discuss subjects referred to in the Chairman's report from the Subcommittee on Agenda and Procedure at this morning's sitting (*See Evidence*).

On motion of Mr. Cafik,

Resolved,—That the report of the Subcommittee on Agenda and Procedure be adopted.

The meeting was adjourned at 8:55 p.m., until Thursday, February 27, 1969 at 11:00 a.m.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Tuesday, February 25, 1969.

The Chairman: Gentlemen, I believe we are ready to begin. Your steering subcommittee had a meeting immediately before this meeting to discuss the timing of the trip and the nature of the report. As a result of remarks in the House last Friday, some question arose of whether or not it would be desirable for the Committee to make some sort of report before we returned from the proposed trip.

Inquiries have been made and the subcommittee has been informed that if the Committee could make its report to Parliament by Wednesday, March 26, no statement of government policy would be made before that date. This is the thought. A report presented to Parliament by this Committee by March 26 would give the government time to consider that report before it made up its mind and made its announcement with regard to official government policy on NATO. As members know, there is a meeting in Washington on April 10, so I gather it is desirable that the government makes its decision before that date.

Everything the subcommittee has been able to ascertain indicates that if this Committee could make its report by Wednesday, March 26, this would be a very convenient arrangement for everyone and would avoid the necessity of splitting our report. Therefore, your subcommittee has recommended that we do adopt this procedure. It would require that while we are abroad from March 9 to March 22 members of the Committee should be giving some thought to the nature of the report they wish to make.

Probably the steering subcommittee which prepares the first draft would have to be prepared to work on the Sunday after its return and, possibly the members of the Committee would be asked to work on the Monday and Tuesday after their return in order that we could get a report in French and English to Parliament by March 26.

That is the recommendation of the subcommittee. I do not think we have time this

morning to have any very extended discussion here. If it is acceptable to you, we will proceed on that basis. If you wish to discuss it in detail I suggest that in view of the fact that we have a witness here this morning the discussion be referred to a special meeting which we plan to have on Thursday evening in any event.

Mr. Groos: May I suggest that we proceed with the witness, then, Mr. Chairman?

Mr. Anderson: I disagree with Mr. Groos. I think Thursday is too late. My view is that if we put in a report on March 26 and the government considers it, they will have no time to inform the NATO partners in the Alliance of any government decision prior to the meeting in Washington April 10. I think this is far too short a time and I would certainly like to hear the witness, and I think we should discuss the other problem perhaps immediately following his testimony today.

My view is that I do not like the idea of putting in a report on March 26. I just do not see how it can be considered by the government before such time as they make up their own mind about the Canadian position.

The Chairman: If there is to be an extended discussion I do not think we should have it at this time.

Mr. Anderson: Could we have it as soon as possible after the witness has been heard?

The Chairman: That goes without saying; you will have it just as quickly as it can be arranged. Does the Committee feel that it is able to accept the report of the steering subcommittee at this time, or does it wish to discuss the matter in some detail? Mr.

• 1110

Anderson has indicated that he, at any rate, would like to discuss it. What is the wish of the Committee?

Mr. MacDonald (Egmont): I agree with Mr. Anderson; I think this is an important matter for discussion.

The Chairman: In that event perhaps we could defer the detailed discussion to another meeting. There is a problem with committee facilities. We probably could arrange a special meeting tonight, if this is the wish of the members. Subject to your approval we have already scheduled a special meeting Thursday evening from 8 to 10 p.m. to hear a distinguished German commentator, Mr. Theo Sommer, who will be in Ottawa at that time and who can give us some useful information, I think. What is your wish?

Mr. Winch: Mr. Chairman, may I just say that the matter of a final decision cannot be delayed because on a trip of this nature, with the contacts to be made, with the important people to meet, we just cannot put external affairs and defence in the position of being left up in the air. If there is to be any change made, then it has to be done today; there is no question about that.

Mr. Cafik: Mr. Chairman, the point about the date of the report and the time the government would have to consider such a report I think is a valid comment. But are you concerned with the trip itself and the dates surrounding the trip, or are you concerned with the reporting procedures? We might be able to agree to the trip as laid out and settle that problem, and then decide what we are going to do in terms of reporting to the House of Commons, if that is the point you are trying to make.

Mr. Anderson: I do not know what the Committee wishes to decide. I am certainly in favor of going on the trip because I think it would be very valuable, but we have heard a great number of witnesses in the past two months. My own view is that we should at least give the government some guideline to our thinking before we go to Europe, because if we come back here on March 22 and then give our recommendations to the government on March 26, this assumes that every member of the Committee stays in Ottawa and does not go back to his riding after being out of Canada for two weeks.

If we do that and get that report in on March 26, the government has a very short time to consider our report and an even shorter time, perhaps, to inform our NATO partners prior to the meeting in Washington on April 10.

The Chairman: Gentlemen, we could get into a very extended discussion. May I suggest, then, that we have a special meeting

this evening from 8 p.m. to 10 p.m. to discuss the matter in detail to arrive at a definite decision. Is this satisfactory to everyone? I do not wish to be arbitrary, because of other committee hearings we cannot meet this afternoon. Therefore, we should plan on finishing our interrogation of Professor Warnock this morning by 1.00 p.m. or 1.15 p.m.

A notice will go out, then, from the Clerk to members of the Committee indicating the place of the special meeting this evening from 8 p.m. to 10 p.m.

Gentlemen, our witness today, as I have indicated, is Professor John W. Warnock. His written statement and biographical details have already been circulated to Committee members. Professor Warnock is now Assistant Professor of Political Science at the University of Saskatchewan. He is well known for his critique of NORAD. It is on this subject that he will present his views today. Professor Warnock, would you like to make a brief introductory statement before the questioning?

Professor John W. Warnock (Assistant Professor of Political Science, University of Saskatchewan, Saskatoon, Sask.): Although I was primarily asked to come here to speak on North American Defence Policy, I thought I would make just a few short comments today on foreign policy in general. Particularly because many people, including Mr. Sharp, indicate that nobody, in effect, is providing any alternatives to the present policy, I thought I would like to make some general comments.

I think, first of all, everybody agrees that the long-run goal of Canadian defence policy is to foster world peace, but the question really is, how best can this be achieved?

• 1115

The primary purpose of the current review as I see it is to determine whether the existing policy which was developed in an immediate postwar period is still valid today. Is the greatest threat to world peace the Soviet Union? Is that country poised waiting for a chance to invade Europe? Is it planning to attack the United States? Does the alliance system of the late nineteen-forties in Europe and North America still provide the best approach to world peace for Canada? Are these alliances still effective? Do they require the huge commitment of Canadian resources and efforts? These are the questions that any review of Defence Policy must answer.

In my opinion there have been significant changes in the world situation in the past 20 years which has made the contribution of Canada to NATO and NORAD obsolete. First, the centre of concern now throughout the world is not Europe; it has shifted to the underdeveloped world. Furthermore, China is now considered by most Canadians, according to public opinion polls, to be more of a threat to world peace than the Soviet Union—far more so. Yet, the whole Canadian defence or effort is still oriented towards Europe and the Soviet Union.

Also, I would like to point out, which is a point that has been raised by other witnesses, that all the armed conflicts in the world since the late nineteen-forties have occurred in the underdeveloped countries, not in Europe. As Secretary of Defense McNamara has stated many times, including in his statement to the press in Montreal a couple of years ago, the real concern of the Western countries is the underdeveloped world. He pointed out at that time that there are 40 states in the underdeveloped world today which are now in state of permanent revolution.

The question, then, for Canada is, do we really want a policy which is concerned with promoting peace and how best should this policy be carried out? I would agree with other critics of the present situation that Canada's contribution, militarily and politically to the NATO and NORAD alliances is very small. We have very small political influence which is to be expected in an alliance with a super power. Furthermore, our military commitment is very marginal to both operations. I think everybody would agree with that.

If Canada did withdraw from NATO and NORAD and shifted its interest to other areas in western Europe primarily, the question is, would Canada's military and political influence rise in the cause of peace? In my opinion, it would. It is my opinion that Canada's military and political influence in the alliances system now is very small, and if Canada did withdraw from the alliance systems—the political influence of Canada would probably rise. There is no indication anywhere that Canada's influence would drop.

For example, the main alternative policy, which is being promoted by people like Dalton Camp and Eric Kierans, is based on the premise that Canada does make a very, very small contribution and has very small impact

on NATO and NORAD, but if Canada shifted to another area, Canada could have a much greater impact.

Particularly, Mr. Camp has raised the question of shifting our defence budget to foreign aid. It could be pointed out, I suppose, that our military contribution in terms of the defence budget as far as the NATO alliance is concerned is only about 2 per cent of the total NATO budget. Our military troop commitment is something like one-half of 1 per cent of the total military contribution in NATO. But if Canada shifted this defence expenditure to foreign aid this would amount to a 20 per cent increase in the total Western foreign aid to underdeveloped countries. As many people have pointed out, this seems to be particularly an area of need right now because the other Western countries seem to be cutting back on these underdeveloped countries and great publicity has been given to the growing gap between the rich and the poor. And as Mr. McNamara, former U.S. Secretary of Defense, has pointed out, this was one reason why he was quite happy to move from the defense department to head the World Bank, because he thinks that the real crisis in the world is not in Europe, it is in the underdeveloped countries.

If Canada wants to make this policy change, which I am suggesting as well as others, there seems to be two alternatives in giving aid. One would be to direct it to the United Nations, and I think the way we direct it to the United Nations is important. I would suggest that it be submitted to the United Nations Industrial Development Organization because there is a wide recognition now that

• 1120

the plight of the vast majority of the poor countries in the world today will not be improved until they are industrialized, and the present approaches to foreign aid are doing very little to industrialize the underdeveloped countries.

The alternative second policy which is being promoted and was particularly promoted in Stephen Clarkson's book, is that Canada should be selective in its foreign aid. The main political aim of selectivity approach is the growing feeling that Canada is becoming more and more integrated into the United States and this is a rather dangerous policy. For example, in 1968 about 70 per cent of our trade was with the United States and this is approximately the same as Guatemala and

Nicaragua, and leaves many people like the late Ralph Allen of *Maclean's* magazine to comment that Canada is the northernmost banana republic.

The main concept of selectivity is an attempt to reverse the trend towards integration with the United States and move away to try to re-create an independent Canada through a selective aid program, mainly through the Commonwealth countries and mainly through the francophone countries and the underdeveloped countries, as well as to make a real attempt at trade diversification, particularly expansion of trade with Japan and China who are obvious trading partners. This would tend to reverse the trend towards further economic integration with the United States.

Finally, I would say along with others that there is really no reason why Canada should ever want to join the Organization of American States. There is absolutely nothing to be gained from this except more headaches, more problems and more conflicts. Anything that Canada wanted to do in Latin America could be done outside the Organization of American States.

In effect, I think it must be recognized, and I do not think that this recognition is made by many people, and I think it is confused by statements of government officials, that there is a vast difference between a policy of neutralism and a policy of non-alignment. They are two entirely different things and in my opinion as well as most of those who support my position on Canadian foreign policy, Canada could not really ever be a neutral country because we are a Western country. We are a white country in a world which is primarily non-white. We are a Christian country in background. We are a capitalist country. We have this whole long tradition of association with the West which could not really be discarded. It would be impossible for Canada to be a truly neutral country, which means that we would have to be non-partisan and refrain from taking sides.

There is a vast difference between this and being a non-aligned country such as Austria, Sweden or Ireland. These countries are Western in their attitudes but they are non-aligned, and this gives them a great deal of freedom of movement.

In conclusion then, what I am calling for is really a non-aligned policy and a shift in emphasis in Canadian foreign policy. It calls

for a positive approach to Canadian foreign policy, and this may be too much to expect, considering tradition in Canada.

The Chairman: Thank you, Professor Warnock. I might mention that if members have supplementary questions, they would be in order, but I would ask that they exercise a little self-discipline and relate them specifically to the main question. Mr. MacDonald.

Mr. MacDonald (Egmont): Professor Warnock, I wish to deal with two or three things that arise out of the brief we had an opportunity to read before your testimony today. You spent some time in your brief indicating that you believe NORAD is no longer a useful instrument as far as Canada is concerned. Of course, this has been mentioned to us by other witnesses. In the light of that statement and your arguments in support of it, why it is that the Americans, who are obviously putting the largest amount of money into NORAD as compared to the relatively small amount that Canada invests, are continuing the NORAD operation, if it is no longer really militarily justifiable? This is not mentioned in your brief, and I wonder whether you...

Professor Warnock: I do not know exactly what their reasons for it are. As early as 1965, Secretary of Defense McNamara, said that NORAD is obsolete. In his statement to Congress on February 1, 1968, he stated that they were going to withdraw from at least the old Pinetree and DEW Line, because they were completely obsolete.

I think we have to recognize—anybody who

● 1125

has been in the government, and I was in it a short while, recognizes—that government becomes committed to existing policies. You have establishments, and Parkinson's Law operates in the military area as well as it does in the area of general bureaucracy. It is difficult to phase out programs overnight when you have a very large body of people who are committed to it. This is in effect asking them to give up what they are doing and saying that what they have been doing in the last few years is obsolete, and that it was unnecessary anyhow. This is a very difficult decision to make.

There is no doubt in my mind that Secretary McNamara's opinions on NORAD were shared widely by the Kennedy administration and the civilian side of the government, but

the military side was totally opposed to withdrawing from NORAD. They had an institution, and a dedication to it. It is a military program.

Mr. MacDonald (Egmont): Are you suggesting then that when the agreement is renewed, or even now when on one year's notice we can change our relationship to NORAD, it might be helpful to the American administration if we said to them we no longer think NORAD is a justifiable expenditure as far as our defence budget is concerned, and we suggest either ending or substantially altering this kind of relationship?

Professor Warnock: I do not know whether the new Nixon administration would share the same views as Secretary McNamara did. But I think, and this is borne out by statements by prominent Americans including Senator Mansfield, that the Americans are in a position now, the government is in a position now, where it expects Canada to do almost anything and is quite willing to accept almost any change. Senator Mansfield fully expects Canada to withdraw from NATO. I think the Americans are ready to accept this right now. They think, because a lot of publicity has been given to defence policy, that Mr. Trudeau is really going to initiate some significant changes in the direction of Canadian foreign policy. And as I have indicated in my paper, I think they might welcome at this time any Canadian initiatives for change in the North American defence area.

Mr. MacDonald (Egmont): Regarding another aspect of your brief. You suggest that Canada should have played the lead or should play a lead even now in building some kind of a detente between the Soviet Union and the United States, and in particular you suggest that we should be much more open with regard to the use of the Arctic, that we should involve ourselves in some kind of military neutralization of the Arctic region.

You seem to be arguing against yourself here because you also suggest that perhaps there is not a great concern today with the implanting of certain kinds of military hardware in the Arctic. I wonder whether there would be any significance in terms of decelerating the tension that exists between the Soviet Union and the United States simply by taking the kind of action you suggest. I wonder whether you really come to grips in your brief with any way in which Canada

could be some kind of a referee or a negotiator in terms of lowering the tension in that regard.

Professor Warnock: I did not go into very much detail in this paper. Perhaps I should have gone into more detail. What I really meant to say was that the military concept of the warning systems like the DEW Line are not very significant anymore.

Joint Russian, Canadian and American operation of a DEW Line warning system back and forth would not mean very much militarily because the United States is primarily concerned about the whole defence status and is oriented towards watching for a massive attack. They are not concerned about whether one aircraft strays over. They are looking for a massive attack, which can be picked up on other radars they have. Even though in the military sense an experiment such as opening radar systems both ways may not have much significance, nevertheless it would be a step towards a detente. I feel this would be as important as, if not more important than, the test-ban agreement on atmospheric tests.

• 1130

I think that both the United States and the Soviet Union right now are looking for areas of detente. As you know, President Nixon, along with other members of his administration, is saying quite often that they want to undertake negotiations with the Soviet Union for reduction in missiles. They are looking right now to open areas of further detente between the Soviet Union and the United States. I think in this case the Canadian initiative might be welcomed as an opening. Also this I feel is an area, because it is not of great military significance to either the United States or the Soviet Union, where a compromise could be worked out, where we could begin working together, where we could establish a precedent for disarmed zones and zones without offensive weapons, and where you could experiment with some kind of inspection and other techniques.

The agreement between the Soviet Union and the United States to end atmospheric tests was not a tremendous breakthrough in anything, and yet it has had a tremendous effect. In a specific way it does not indicate a great area of agreement between the two countries, but it had a tremendous effect upon relationships between the two countries. I believe it is in Canada's national interest to

try to minimize conflict between the Soviet Union and the United States.

Mr. MacDonald (Egmont): I will pass, Mr. Chairman, and come back later.

The Chairman: Mr. Brewin.

Mr. Brewin: Mr. Chairman, may I ask Professor Warnock if he is suggesting to this Committee that the NORAD anti-bomber defence system is really non-productive and that there are other more productive things on which we could use our defence dollars?

Professor Warnock: Yes.

Mr. Brewin: I would like to take up your reasons for that. First of all, I think it is conceded that this defence system is useful only against a bomber attack. In your opinion, is it rational under modern technological conditions for the USSR to launch a bomber attack on North America?

Professor Warnock: No. I think this is the position that Secretary McNamara made many times. This is why he was for doing away with the NORAD defence system. He said that obviously if the Soviet Union is going to attack the United States, which in his opinion and mine would be mass suicide and a ridiculous policy, they would start with the missiles. If you start with a bomber attack, you are in effect giving the Americans a two-hour warning. It would take two hours for the bombers to get over here. So you would attack first with the missiles, and in fact the whole strategy of NORAD is based on the expectation that if an attack does come, the missiles will come first. For example, at the NORAD base, when the first warning comes everybody runs and hides, waiting for the bombs to go off. This is the first exercise in the event of a crisis, and then presumably if you are still left, you come up after the missiles have been fired and if there is anything left for the bombers to bomb or if you are left, then I suppose you could do something.

Mr. Brewin: You are taking me a little ahead of my intended questioning, but if there was any intention to use bombers as a second blow after ICBMs had first been used, are not the bases fairly vulnerable? Would it not be possible for the Russians to take out these bases by landing a few of their ICBMs on them? Do you think there would be much effective defence left after a fairly good salvo of ICBMs had been launched at these bases?

Professor Warnock: No. As a matter of fact, it becomes difficult to comprehend, you know when you get into this gamesmanship back and forth, of who is going to drop how many bombs on what, to realize the totality of the destructive possibilities of these two countries.

I do not know exactly how the United States make their estimates, and presumably they are more accurate now that the spy satellites are collecting information, but they estimate this January that the Soviet Union has 900 ICBMs and that they are converting these to multiple warheads. They expect multiple warheads to be in effect in the United States in a year, and I suppose the Russians will be there at the same time.

• 1135

The Russian missiles, however, are capable of carrying much more multiple warheads than are the American, because they are bigger weapons. Even if you just talk about 900 weapons dropping hydrogen bombs of up to 50 megatons all over the United States there is absolutely nothing left of the United States. Apart from what was destroyed in the blast, there would be nothing left because of radiation. In fact, if you have the situation in which the Soviet Union and the United States exchange all their missiles it is very likely that that is the end of the world. The radiation from this would be so great that everybody would be wiped out. Nobody comprehends this, and really, after this happens, to talk about the effectiveness of shooting down a few bombers is rather ridiculous.

Mr. Brewin: If you first of all assume that the Russians do the irrational and launch a bomber attack they would only do so, I take it, as a second blow after the ICBMs had been launched first? Assuming they decide to use this suicidal method of warfare they would first of all use the ICBMs; and you agree with me that these ICBMs could effectively destroy the so-called defensive anti-bomber system?

Professor Warnock: Yes.

Mr. Brewin: I notice that in your paper you use the figure—even as in the good old days of 10 or 15 years ago—that about 50 per cent of the incoming bombers would get through. From where do you get the 50 per cent? We of this Committee, or of its predecessor, have often inquired what was the rate of attrition as I think the word is.

Professor Warnock: It is very difficult, because the airforce does not like to admit that the effective defence is not effective in the traditional sense. They will admit, even today, that the offence, just in terms of bombers, poses a tremendous danger to the defence; and even if only 10 per cent of the Russian bombers got through in this period before the missiles that would be enough to destroy all the meaningful targets in the United States.

I, like you, have asked, and I get various responses—anywhere from 10 to 50 per cent. The most anybody has ever admitted that they would be able to shoot down is 50 per cent. I asked several RCAF people last year, privately, and they say it is roughly about the same now; although they will not state that publicly.

Mr. Brewin: May I come to another point? According to what you tell us—and I must say I agree with it, for other reasons—it is a very strong case against the usefulness of this whole anti-bomber system.

Have you seen any clearcut statements in the literature about these matters—any reasoned statement on why it is thought that this method might have some usefulness? I have not been able to find it, and I wondered if you had run across a statement of the case. I would be very interested, if you know of any such exposition.

Professor Warnock: Not much has been written in this area, really, since the introduction of the anti-ballistic missile. This has attracted all the academic attention and all the military attention. Nobody even thinks about the bombers any more. The only defence really made, even by the military, for maintaining a bomber defence today is the statement, "If you shoot down 50 per cent of the incoming bombers, it is that many fewer bombs dropped on your country". It is hard to imagine what good this would do after a country has already had at least 900 multi-megaton bombs dropped on it—whether it is at all meaningful. President Nixon says it is an aspect of our over-all defence posture, but it is certainly a marginal aspect.

I agree with you. I have seen no significant consensus that has been presented lately, probably because it appears to be such a marginal thing.

Mr. Brewin: It may be marginal, but have you any estimate of how much it actually costs Canada annually to maintain this system?

Professor Warnock: The only estimates I have seen are government estimates—\$139 million, or something like that.

Mr. Brewin: And does that figure include

• 1140

the cost of replacing the interceptors, or the system, at all?

Professor Warnock: No. That is just the direct cost, too. From what I have been able to extract from government statements and documents, I do not think includes, for example, the cost of all the back-up behind the system—the training, the equipment, the servicing, and so on. That is just the direct cost.

Mr. Brewin: Your views on this are not based, I take it, on any political objection to co-operating with the United States in North American air defence, but are based upon the obsolescence of the means adopted?

Professor Warnock: Yes. I do not think this serves any purpose. If it really did I would look at it in a different way; but because it cannot possibly do what it is supposed to do it does not seem to warrant attention or the commitment.

Mr. Brewin: I have one final question. I do not want to take too long. It relates to what you say at the foot of page 3:

It is about time the Canadian people admitted that their annual expenditure on the North American defence system is a complete waste of money.

Perhaps this is a rhetorical question, but how do you expect the Canadian people to say that, in a highly technical field, when the Canadian government tells them it is necessary to proceed. Surely the responsibility is not that of people who are hardly likely to be over well-informed about these very technical matters?

Are you not putting the responsibility in the wrong place? Should it not be in the government, or Parliament, or our defence establishment? How can you blame people for accepting something like this?

Professor Warnock: Perhaps the majority of people are not capable of making a decision on that, and perhaps they are not interested in it, but when the government is totally committed to a certain policy you do not really expect it to go around denouncing it. Perhaps Parliament should spend more time criticizing these areas.

I have also found in my own work, particularly last summer in serving news coverage on foreign policy and defence in Canada on which I did a study, which is not yet published, on the news coverage of major developments on the renewal of NORAD and our decision to go ahead with anti-ballistic missiles, that it is very shocking to see how little coverage the press in Canada gives to areas of foreign policy and defence. It is therefore, very difficult for the average man on the street to become really well informed upon these areas because he does not read much about them in the press.

There are many reasons for this not being presented in the press. For example, I took 20 major pronouncements by the United States Government and the Canadian Government on these areas over a 15-month period and looked at 30 daily newspapers in Canada to see just how many covered it in any detail at all. Only 23 per cent of those items were covered in the 30 newspapers. That is looked at 20 times 30, only 23 per cent even bothered to cover these areas.

Also, significantly, primarily because of the Canadian daily press's wide use of the wire services of the *New York Times*, there was better reporting in the Canadian press of American military announcements from Washington than of Canadian announcements or reports of Canadian debates in Parliament.

I suggest it is very difficult for Canadians to become well-informed on foreign policy. They just do not have the opportunity.

The Chairman: Mr. Laniel?

Mr. Laniel: Mr. Chairman and Professor, on that last point, why might there be some criticism from the population on our defence budget or the use that we make of it? Primarily, I think they are more concerned about the money that is not spent on something else—that is, on welfare, or things of that kind. I am not so sure that the population in general would be more interested in the transferring of part of that budget to external aid.

Professor Warnock: No; I quite agree with you. Given the choice, they would probably prefer to have that money spent in Canada, on Canadian projects.

• 1145

Mr. Laniel: You seem to eliminate the deterrent aspect of alliances, be they NATO or NORAD. Perhaps I am completely wrong, but I wonder if some of our alliances are not

really a deterrent that goes further than we think. They go further than preventing a nuclear war, because although the big powers are confronting themselves with the possibility of nuclear war does that not eliminate the danger of conventional war in these same territories?

Professor Warnock: First of all, I would argue that the deterrent in North America is not NORAD but the Strategic Air Command. This is borne out by the action of the American Government during the Cuban missile crisis.

Second, I would say that what has prevented war in Europe is not really NATO. In the early period, it was the weakness of the Soviet Union. If the Soviet Union had designs about invading Germany, for example, her weakness for a long period of time would have prevented that; and since that time it has been the presence of the bomb which has scared the Russians, even if you presume, first of all, that they are interested in invading Europe—and I do not agree with that.

But if you presume that, what would deter her is not NATO but the fear that if this happens it will result in an all-out war and that nuclear weapons will be used. If a full-scale war breaks out in Europe the Americans are automatically involved in it, because they are on the Rhine, and so on; and it is natural to think that this is going to lead to a direct war of nuclear weapons.

Mr. Laniel: Yes but if we ever come, over will we have settled the problems of war in Europe, or would there be a greater danger of war there?

Professor Warnock: I do not know what kind of danger there is of war in Europe. It seems to me, for example, that Russia's position among the Warsaw Pact countries today is weaker than it has ever been in history, politically, and with so much trouble with Albania, Roumania, Czechoslovakia and Yugoslavia, and you read of protests even in East Germany on the occupation of Czechoslovakia, you realize how very weak and unstable the Russian position in Europe is. In fact, they use the existence of NATO all the time to justify their occupation of Eastern Europe, and their occupation recently of Czechoslovakia. They are in such a weak position even within their own satellite area that I do not see how they could conceivably think of any kind of a war in the area unless it be one to subjugate one of their supposed allies.

Mr. Laniel: In thinking about our possible withdrawal from NORAD you seem to forget, or you do not say anything about, what our Armed Forces would become, nor do you mention anything about the sovereignty of Canadian territory, although you speak theoretically of a no man's land up north, or land left open to the big powers for observation posts, or things of that nature.

Are you not afraid that a big country such as the United States, which feels that it has a responsibility to defend its people and to protect peace in the world, may, at some stage, if their interest is at stake put some kind of pressure on the Canadian Government to force it to look after our air space? What military force will you have in Canada for a situation such as that?

Professor Warnock: I think we look at these problems differently from the United States. If you examine the Cuban missile crisis you can see exactly how the United States looked at that situation and what role Canada really played in the minds of the Americans in taking that decision because this was a real decision—a real confrontation between the Soviet Union and the United States. After the United States Government determined that the Russians were installing ground to ground ballistic missiles in Cuba, the first thing they did was to order an alert to the Strategic Air Command to disperse the B-47s to other private civilian bases. They put the B-52s and B-58s on airborne alert, they alerted the missile sites, they alerted their defence forces and they alerted NORAD in the warning system, and it never even occurred to the United States at any time during that crisis that the role of Canada was an all-important one. They did not even think of Canada. They did not think of the defence capabilities. If you read all the inside reports on what happened, the only thing they were concerned about was the deterrent, that is, the Strategic Air Command, protected, and they considered it to be protected, because the American government does not consider the defence forces to be at all significant. They do not consider the territory, or whether or not Canada maintains sovereignty over its territory to be important. They are watching the radar screen to see if the missiles are coming or if there is a massive bomber attack coming. That is the only thing they are concerned about—whether their deterrent is protected. As President Kennedy said and as Robert Kennedy stated in his book about the 13 days, the only thing they were concerned

about was if the deterrent was protected, and the only thing that protects the deterrent is the radar system. This is really outside of Canada right now with the new over the horizon radar and the ballistic missile early warning system.

If you read all the inside stories of what went on, Canada was not even mentioned until the whole thing was over. Then they heard that there was a debate in Canada over whether Mr. Diefenbaker did the right thing, and then they become concerned about it. But it was never mentioned during the whole period. My point is that, from the American point of view, this is not too important.

Mr. Laniel: On another point, you were asked the question that if we withdrew from our alliances would Canada's political influence be increased, and you seemed to say "yes." This is not necessarily the impression that we got from the people who went to the Canadian mission in South America, because they told us that many of the South American countries representatives there must inquire about Europe, about our influence in NATO and what was going on under the blanket and so on. They were concerned. The impression that I got, at any rate, from what was told to me, was that they seemed to think that we have a preferable position being right in the discussions of the important nations that do have influence in the world. They think that our position there is strong enough that we have last minute information and, at the same time, might influence a decision.

Professor Warnock: Yes. I have heard this argument many times and from two points of view I do not agree with this concept that Canada has any influence on the United States. First of all, historically speaking, small powers have never influenced great powers on policy, and great powers have never consulted with small powers before making decisions. Secondly, the Americans are perhaps more nationalistic, strongly and emotionally, than most countries in the world and they do not consult with anyone. The Cuban missile crisis is a good example. When they are going to form a policy, they form one by their own. They do not consult anyone. That is to be expected because they are such a great power, and because they are very nationalistic.

I have looked very closely at this in my own study of decision-making in NATO. I have looked at about 15 major decisions in strategy in NATO and I find consistently in

each case that they are formulated in the United States, by the United States government, to suit American policy as they see it, and then given to the NATO council for approval. This is the way you would expect it to be because of the power position of the United States within the alliance system. I do not see that Canada or even Britain has any

• 1155

influence on the United States. Certainly, the Cuban missile crisis was a situation that affected Canada more than any other country in the world. We are caught in the middle. I was in the State Department at that time and I can tell you we were scared. It is over now and everyone thinks Kennedy pulled it off and everyone thinks this was a good thing, but people were even scared in the State Department that this was going to erupt into a nuclear war. Here was a situation that affected Canada more than any other country in the world, because we are caught in the middle and if there is a nuclear exchange, we are going to be destroyed. Yet, it never even occurred to the United States that they should consult with Canada ahead of time. They just do not operate that way.

Mr. Laniel: Yes, but if you look at it from the other side, do you not think the fact that Canada and other NATO countries did take some stands that were different from the United States on the question of Viet Nam might have had an influence on the decision of the United States to sit down at the table in Paris?

Professor Warnock: It might have, but in my opinion it was the growing opposition in the United States and the problems, economic and others, that really caused them to change their minds on that. I do not think that the United States, as a great power, operating as great powers have always operated—the United States is a super power, the most powerful country the world has ever known—would, if it makes up its mind to do something, be deterred by public opinion. For example in the Cuban missile crisis, when U Thant of the United Nations tried to step in, if you read Sorensen's or Schlesinger's or Kennedy's report, they looked upon this as an unwarranted intrusion by the United Nations on a matter that was theirs. Schlesinger and others have quoted President Kennedy's statement that this was messing up what the United States was determined to do and they did not like it. I think this is the way great powers operate.

Mr. Laniel: I have other questions, Mr. Chairman, but I will pass.

Mr. MacDonald (Egmont): I have one short supplementary. Do you think that the new administration and particularly President Nixon's comments on his present tour of Europe indicate perhaps at least an opening of the door towards some possible consultation? I agree pretty much with what you have said, but do you see any change at all under the Nixon administration with regard to this question of consultation, or is this mostly window dressing?

Professor Warnock: No, I think periodically they say, when it gets right down to the nitty gritty, they would be quite willing to consult in advance. They could conceivably—and there is no reason why they could not—have consulted in advance, for example, before they decided to install tactical and nuclear weapons in Europe or put Jupiter missiles in Italy and Turkey. They did not have to go ahead and do that on their own. They could have, but when it comes down to crisis situations, like Cuba, they are not going to consult with anyone; they are going to make their own decisions.

Apparently, it is because of the structure of NATO. NATO was originally established as a traditional military alliance, and if you read the Treaty and the statements by Mr. Pearson and others at the time it was defended in the House of Commons, you will see that he said this did not commit Canada to automatically participate in war in Europe, and that we would do nothing in Europe until we consulted Parliament. It was a traditional military alliance. After the Korean War, however, it was transformed into a highly integrated alliance, presided over by the Supreme Allied Commander in Europe who was an American general who owes, under the constitution, his command directly to the President of the United States. He takes orders only from the President of the United States, and he, in effect, controls the American and all the other forces in Europe. This creates a situation in the integrated alliance system which was opposed by France even long before de Gaulle. It created a situation where the United States was bound to dominate and where the decision-making structure of NATO goes from the United States and the President down through the military structure which is integrated in the United States, and this makes the traditional consultation very difficult.

The Chairman: I have eight members who wish to ask questions; perhaps they could try to keep the questions as brief as possible in order to cover them all by 1 o'clock. Mr. Howard.

Mr. Howard (Okanagan Boundary): Thank you, Mr. Chairman. We had some witnesses from the Hudson Institute who disagree with your view about the effect of an all out nuclear war on the continent. You suggested that it would be a complete wipeout as far as North America was concerned, or, in fact, as far as the whole world is concerned. These specialists in civilian defence quoted some pretty horrible figures, but they certainly did not paint any kind of picture such as you paint. They said that there was every possibility that millions would survive.

Professor Warnock: I looked at their testimony too and I think they are primarily concerned about blast effects and fire effects. They did not take into consideration, if I read it correctly, the long run effects of radiation. I would suggest, for example, the briefs and testimony presented by the American Federation of Scientists which includes some of the

• 1200

most prominent American nuclear scientists completely contradicted this and believed that if this were an all-out attack it would probably be because of the radiation, maybe not within the next week but within the next month or so, and there would be radiation effects.

You may recall at the Bikini rests in 1954, where they let off one hydrogen bomb of 20 megatons or something like that, several hundred miles downwind there was a little fishing boat and one of the Japanese fishermen died from the exposure to the radiation from this one tiny bomb.

If we speak of 900 missiles exploding over the United States and then the United States exploding 2,000 missiles over the Soviet Union—and with the Soviet Union you cannot tell how large their warheads are, but their rockets are much greater and more powerful than the United States, all indications are that they have adopted the strategy of using a very large nuclear warhead; we know they have tested up to 100 megaton warhead, and if they start blasting off 900 of those over the United States there is not going to be much left.

Mr. Howard (Okanagan Boundary): We did discuss with those witnesses the matter of

radiation effect and they did refer to this in connection with the figures that they offered. They suggested that with some control measures it was possible to change that picture quite drastically.

Professor Warnock: This has been an area of dispute in the United States for years.

Mr. Howard (Okanagan Boundary): I beg your pardon?

Professor Warnock: This has been an area of dispute in the policy formulated in the United States for years.

Mr. Howard (Okanagan Boundary): Yes. I want to mention the other main point. It would seem to me that any test of foreign policy or defence policy is whether it succeeds or fails. In the case of NATO, on the general posture of our side, we have been reasonably successful in that we have not had a major war of the kind that we fear particularly. Therefore, the policy, whether it includes NATO or not as a major link, has been successful as far as we are concerned, and if you suggest that we should dismantle it as far as Canada is concerned, I can certainly agree with you that the situation perhaps has changed considerably, but there is nothing to suggest that Russian motives have changed, only their appraisal of any success that they might have under the conditions that exist under the defence situation that there is. There is nothing to suggest that if we changed our defence posture, including NATO, that the Russians would not begin their probes again and decide that they were in a position to take advantage of a situation.

I suggest to you that one of the reasons why there are revolutionary forces working in other parts of the world is because revolutionaries feel a basic security in the world around them as far as the major conflict is concerned. They feel that it is contained until they are free to go about the business of developing their revolutionary forces where they are. This is one of the reasons why we have so many smaller revolutionary forces going on in other parts of the world.

Professor Warnock: First of all, I agree that there has been an absence of war in Europe. I do not know whether or not it is fair to say that it is due to NATO.

If you look at the whole strategy of Soviet defence policy and other Communist defence policy, as well as the ideological commitment of Communism as a movement, it has never advocated and in fact has never practiced the

concept of exporting revolution by force of arms in a direct way; that is, in the way Germany invaded France, or something like that. They have consistently looked upon the army as a defence to the revolution, against counter revolution, and have expected fully that they would be able to export Communism by promoting revolution indirectly. If you look at their whole analysis, they think that internal conditions in a country are what create the atmosphere in which revolution can be successful. It has nothing to do with, for example, the Soviet Union marching into Germany, and I would say this is totally inconsistent with their historic defence policy, with the historic ideology of communism. Certainly this is true with respect to China. China has never marched into its neighbours. And they could, they could run over all of southeast Asia if they wanted to.

Mr. Howard (Okanagan Boundary): They marched into Hungary and they marched into Czechoslovakia.

Professor Warnock: They were already in Hungary. They were there at the end of the war; they came in during the war. They did not march into Yugoslavia, for example, when Yugoslavia broke away, so they were not there.

Mr. Howard (Okanagan Boundary): But there have been instances where, let us say, they remarched into Hungary and they remarched into Czechoslovakia. They were there but they used their military forces.

Professor Warnock: They marched back into Czechoslovakia but I do not think that indicates they were ready to march into Germany. They considered that an area of vital interest to them, and I think this indicates even more that they are looking inward rather than outward. They are trying to maintain what they have now. They are not trying to communize Western Europe by sending in tanks. I think what they hoped would happen in Western Europe was that the communist parties in Italy and France, for example, would become strong enough to assume the government directly that way. Certainly that is their whole strategy now and, in any event, Soviet Union strategy throughout the whole world today is not to promote revolutions but to try to achieve office through the electoral process. This is particularly true in Latin America.

Mr. Howard (Okanagan Boundary): Thank you very much.

Mr. Anderson: Professor Warnock, my questions are based almost entirely on your initial statement rather than on your written statement. In the first place, I must say I was in complete agreement with your views on the OAS. I find it very curious that people would suggest that we get involved in an organization which has so little to offer Canada and, indeed, in which there is no role for us to play. However, after agreeing with you there I am afraid I disagree in various other areas.

The basic assumption lying behind many of your remarks seems to be that somehow by increasing our aid we would have a greater impact on the third world. Could you define for me what you mean by this word "impact". Do you mean influence; do you mean...

Professor Warnock: I think this is perhaps the greatest impact that the Kennedy administration had on the whole government structure of the United States; that is, turning the attention of the United States away from Europe and to the underdeveloped world, realizing that the real crisis of our time is the north-south split. It is not the east-west split between the Soviet Union and the United States. My whole premise is that something drastic must be done or the revolutionary expectation, as it is called, will now turn to armed revolution. This was McNamara's and Kennedy's proposal and therefore something really must be done to head this off, and it was for this reason that McNamara went to the World Bank. He said that something must be done to solve the problems of the underdeveloped world. We are going to wake up in 10 or 20 years' time and find that the whole of the underdeveloped world has gone communist and therefore it is in the interests of the Western countries to try to head off the revolution towards Communism in the underdeveloped countries, and this can best be done by positive means. The tragic thing, as McNamara has stated since he became head of the World Bank, is that the Western countries are actually cutting back on their aid to underdeveloped countries and therefore some country, and preferably a Western country, must take a lead in illustrating to the world the magnitude of this problem and that there is a solution but the solution requires more than tokenism, it requires a major commitment and this is something that Canada can do. Therefore Canada could make a big impact in the world by shifting her total defence policy towards foreign aid, recognizing then that this is the real problem in the world today

and it has to be solved. It requires more than tokenism and it requires more than the Viet Nam war, it requires a positive effort and the countries that are marginal in a military sense, such as Canada, can perhaps make a bigger impact toward world peace by direct-

• 1210

ing their policy toward this area rather than being a minor client state in the alliance system.

Mr. Anderson: I certainly admire McNamara. However, I do not think he is above criticism. He was responsible for the U.S. Defence Department when the American military forces suffered a series of reversals in Viet Nam which are perhaps unparalleled in American military history. I do not blame McNamara directly for this but he is far from being a man who is beyond making errors.

Professor Warnock: He may have learned something from that, too.

Mr. Anderson: Yes, but on the other hand it does not necessarily follow that exactly what he said in the area of the development of the third world is correct. He has stated, and you have repeated, that other nations are cutting back on external aid, they are cutting back on what they are doing abroad. Presumably you were thinking of such nations as the United States and Western Europe. It seems very curious indeed to me and if this situation is as black and white as you and McNamara see it, presumably is as black and white to nations in Europe, and there seems to be sort of a fundamental illogical failing by these countries in Western Europe to cut back at a time when, as you say, it is so clear they should be increasing their aid commitment. Could you comment on that, perhaps?

Professor Warnock: Some countries are increasing, such as France and Sweden, but others are cutting back, and in particular the United States is cutting back. They are partly cutting back because of budget problems. The military budget, which is now \$80 billion in the United States, has forced them to cut back in some areas and they have cut back in the foreign aid area. Perhaps this is why we should help to pick this up because the Americans cannot maintain their foreign aid program because of military restrictions.

Mr. Anderson: This again brings up a logical difficulty that I am having here. That is, that McNamara, who headed up the defence

establishment, who was responsible for spending these billions upon billions every year, now switches to the World Bank, which is essentially an American financed operation, let us be frank. He evidently carries no weight whatsoever in Washington with respect to getting his views accepted because, as you have just pointed out, the Americans are cutting back on their aid. Is this simply an indication that McNamara has done so badly in the Department of Defense that he has been shunted aside to an area where he perhaps can do less harm to the American interests? The fact that the Americans are not providing more money is an indication that the American government is firmly convinced that what he says is not correct. There is a logical inconsistency in what you are saying, sir, which I find extremely difficult to fathom.

Professor Warnock: I do not think there is any inconsistency between recognition of a problem and the solution, and the ability of the government to do it. The United States is now not only faced with foreign problems, there are fantastic problems inside the United States and if you read the Gallup polls correctly I think they are a rough indication that the public thinks they should get out of Viet Nam and put all money into such things as the cities, some of which are almost unlivable in the United States. There is also great pressure to spend money elsewhere. It is very difficult for the government to go before Congress, which is independent—it is not the parliamentary system—and say that they need so much for foreign aid. In fact, it is significant that in the business community newspapers such as the *Wall Street Journal* are strongly opposed to a cutback in the foreign aid program. There are also all these other pressures on the government, and as long as the American government is maintaining an \$80 billion defence posture—and they are faced with this tremendous crisis at home, and it is a tremendous crisis—they find it very difficult to justify foreign aid programs.

Mr. Anderson: This brings up our problem, and that is that perhaps through luck and the grace of God we are somewhat ahead of the United States as far as domestic problems are concerned.

Professor Warnock: Or behind.

Mr. Anderson: Yes, we may be behind. However, surely we should then anticipate

our own troubles and we can perhaps visualize this by what is going on across the border and not get involved in these massive expenditures abroad in either military or aid fields which might possibly delay consideration of domestic problems in Canada. I feel there is a certain logic to that, too.

Professor Warnock: Yes, I agree with you. There are great demands upon the resources of the country and in our system it is up to the government to decide which priority comes first. It may be that Mr. Trudeau, if he cuts back significantly in the defence establishment and not shift us to foreign aid beyond the 1 per cent level but channel the rest of it into domestic—

Mr. Anderson: Certainly this may be.

• 1215

Professor Warnock: In my opinion, I think this is overlooking the fact that we are not isolated in the world. Perhaps we do not realize it as much as the United States because the United States has interests and debts all over the world which Canada does not really have, but in the long run our interests are concerned with the whole world, too. If the whole world blows up, if all of Latin America goes Castro, and so on, if all this happens all over the world, which is conceivable in the next 20 to 50 years, it will also make things bad for Canada.

Mr. Anderson: My personal view is that even if all of Latin America goes Castro, to use your words, the world would not blow up. I think there are still problems involved in what you said. Basically you said we cannot solve the world problems on a global basis by tokenism, simply by gestures, and yet I cannot see, if the United States and the Western European nations are cutting back on their aid programs that Canada, by increasing its tiny amount, can somehow make up for that and furthermore, not only make up for the contributions which the others are not putting forward but turn it from tokenism to a real constructive and meaningful contribution in global terms. It appears to me that faced with the situation which you have described we would be doing nothing more than just giving a token to these countries if we devoted our entire defence budget to external aid. Surely we should perhaps be devoting our efforts to persuading other nations—the United States in particular and Western Europe as well, where we do have

some minor influence, whether it is through NATO or not I do not know—or putting the pressure on them to join with us in such an exercise, unless we should be particularly concerned—

The Chairman: Do you have some specific questions you wish to ask? There are six or seven other people who would like to ask specific questions of the witness. I think we are getting into a discussion rather than into questioning.

Mr. Anderson: I will drop that line then. I was interested in your views on industrialization of the third world. I thought this had gone out ten years ago. It appears to me the development of the third world basically lies in agricultural development. Thailand, for instance, which has a fine agricultural base, is capable of economic expansion while Laos, which does not have a good agricultural base, in my opinion can never develop. Why do you emphasize industry? Do you really feel that this is the only line?

Professor Warnock: No. If you are in a position—and Canada should know something about this because of the huge balance of payments problem every year—of only producing primary goods, agricultural products and extracted industries, and you are importing your manufactured goods, you are going to be permanently badly off. The real reason for the growing gap in the standard of living is because since the end of World War II the Western world has convinced the underdeveloped world that they should only develop primary products in agriculture rather than manufacturing, and as long as they remain hewers of wood and haulers of water they will never break through.

Mr. Anderson: Our prairie farmers remain growers of wheat and yet their Cadillacs descend upon the British Columbian coast every year. I cannot say your logic is very good.

The Chairman: Mr. Anderson, there are other members who have questions they wish to ask.

Mr. Anderson: I will ask one final question then, Mr. Chairman.

The Chairman: Then I will perhaps put you down at the bottom of the list for your additional questions.

Mr. Anderson: All right. You have emphasized the fact that aid is the way in which there is going to be development in the third

world. I cannot understand why you say this. In my view the policy of self-reliance which Chairman Mao has written about many times is a far more beneficial and a far more sure way of arriving at economic development in what we call the third world than policies of aid which are generally construed as neo-colonialism, and certainly as far as impact and influence is concerned I tend to agree that aid policies are basically construed in the recipient countries as merely a device whereby we somehow avoid revolution or stave it off at least for a few years. Perhaps you would comment on this. My view is that aid programs are far inferior to genuine policies of development within these countries in the third world and that we should be encouraging only those that have very, very good policies for their own development.

Professor Warnock: Yes, I agree with this. This is the big crisis, you know. I was in the State Department for a short while when the Alliance for Progress was formed and really what the Americans were saying was that if we do not do something significant in the area of helping these countries to develop they will accept Chairman Mao's thesis that that is the best way to develop, and therefore what

• 1220

the Alliance for Progress was trying to say was that we can give them a Western alternative, they do not have to turn to the communist type of development. As Walter Lippmann pointed out I think quite correctly, the real threat of Cuba to the United States is that the Cuban revolution will work and that in fact they will become independent, they will become self-reliant and their standard of living will rise. Certainly their standard of living in health, education, and so on, has risen fantastically when you compare it with the rest of Latin America. If this is the concern of the American government I suppose it should be our concern as well.

The Chairman: I am sorry, Mr. Anderson, I know you have other questions and I will put your name on the list and I will try to get back to you, but there are six of seven other members who have questions. Mr. Buchanan.

Mr. Buchanan: Mr. Chairman, there has been some expression of thought, coming back to the U.S., that there has been—perhaps I should not say a reversion to the pre-war isolationism—a definite tendency to say: Look, let us look after our own bailiwick and not be concerned with looking after the

whole world. There has been some suggestion, in spite of your suggestion that the U.S. is aware of the initiatives that Canada is taking in this area and the interest which is being shown in our NATO role, that the Americans are totally unaware of the fact that we are considering withdrawing from NATO, and that by so doing we would, in effect, be giving aid and comfort to this viewpoint in the U.S. Let us follow Canada's example; we should be tending our own fences and remaining within the continental United States.

The suggestion advanced was that the net effect of our withdrawal, and suggesting that we are going to put another \$200 or \$300 or \$400 million into foreign aid might be to give aid and comfort to people in the U.S. who advocated far more substantial cutbacks in their foreign aid, and that the net effect of our pittance in this area would be more than offset by the cutback in the American foreign aid. Is that a valid viewpoint or not?

Professor Warnock: Well, it might be. My real reason for advocating this is not to believe that Canada would, on its own, solve all the problems, but it would set an example and it would dramatize to the other countries. Obviously Canada is not going to be able to solve the problems of very many countries if it shifts its whole budget to foreign aid, but it would serve as an example for the other countries. I do not also associate this with an isolationist policy.

I think it is just a shift away from the alliance approach to an international approach more through United Nations and other nonaligned groupings, and so on. I think, also, that there is a trend in the United States against the American commitment overseas. When you see, for example, people like Senator Stuart Symington of Missouri, who has been a strong advocate of military spending with bases everywhere, suddenly becoming almost like Fulbright you will see that there has been a dramatic change, a growing awareness in the United States that the United States is, perhaps, overcommitted and therefore needs to pull back. I think this is growing. We can see this, for example, in the growing popular and Congressional opposition to the antiballistic missile system.

Mr. Buchanan: Do you feel that applies only to the military commitments? You would not put their foreign aid commitments in the same category?

Professor Warnock: No; I think there is a concern in the United States, particularly in Congress, about the cutting back of foreign aid and what this will do, but at the same time recognizing that as long as the military budget is so large this is perhaps inevitable. If you have to set priorities on what you are going to cut back, you have already cut back largely on the poverty programs and other welfare programs in the United States because of the military budget. There is a feeling that you just cannot cut back any farther in those areas so you put foreign aid down at the bottom of the priority and then say: Well, it is unfortunate we had to cut that. We do not like it; we hope to raise it up again when we are able to.

Mr. Buchanan: Mr. Chairman, I have one other question. An economist friend of mine suggested that he thought a lot of our discussion here was somewhat irrelevant in the sense that we had spent far too little time in trying to weigh the economic implications for Canada of the withdrawal from these alliances; that the net effect of this might be to develop in the United States a feeling, shall I say of antipathy towards Canada; that we are sort of letting the team down and this was certainly brought out by Bruce Hutchison

• 1225

in his articles last week, and the result of this would be that when Canada went hat in hand, as we all too often have to do, to Washington to seek certain concessions—for instance in oil, thinking of it in terms of out West or when the U.S. is putting some restrictions on the outflow of capital—instead of getting, as we have in the past, a very warm reception and being accorded our wishes to a large degree the door might be slammed in our face. The economic effect on Canada, if it dampened down our economy somewhat, would be far greater than the savings we would effect by some withdrawal here.

Professor Warnock: I do not know whether you could measure that. I do not feel that the government of the United States would behave in that way towards Canada. To the United States, Canada is important in one respect and this is very obvious. It is important to the United States because it is a source of strategic raw materials and those kinds of things. For instance, 85 per cent of United States nickel comes from Canada, and now Labrador ore is very important, too.

These are the things that are important to the United States, and I do not see how they would cut any of this back. Furthermore, the United States does not control its economy that much in how it operates in Canada, and so on. I do not think that withdrawing from the alliance system would at all interfere with that.

Certainly, for example, if we take Mexico, Mexico over the years has taken a very hostile position towards the United States and even nationalized in the thirties most of its natural resources which were owned by the United States and other Western influences. This has not in any way penalized their economic relationship with the United States. In effect, they put tremendous national controls over their economy, such as no natural resources to be extracted by anyone but Mexicans. All firms in Mexico must have 51 per cent of their stock owned by Mexicans and still, in spite of the fact that they have stood against the United States on Cuba on every question, the United States is knocking at the door trying to invest money in Mexico.

They are having a tough time keeping American money out of Mexico because the money will go where the resources are, where the markets are and, so on. I just cannot see the United States taking any kind of retaliatory measures against Canada.

Mr. Buchanan: I do not know whether “retaliatory” is the word I would use. It is just that our requests would find a much less hospitable climate. It is not that they would actually go out in a malevolent fashion to try to do harm, but if we came seeking increases in our oil import quotas perhaps the voice of the opposition, which is quite vocal, as you know...

Professor Warnock: Yes.

Mr. Buchanan: ... in certain areas of the U.S. would be listened to a little more attentively.

Professor Warnock: Yes, this is one thing I think is a real problem for Canada. It may be an insoluble problem. We are so deeply involved economically with the United States that we may not be able to extract ourselves. I think this is a dangerous situation and as you indicate, and as others like Mr. Pearson have admitted in the past, this fear of retaliation because of the economic integration of the countries has inhibited Canadian political independence.

Therefore, this is one reason why I suggested that we should make a positive effort to move away from this total commitment of integration of economy with the United States and trade investment and so on and move towards the other areas. Certainly this is desired in Western Canada—move toward expansion with Japan and China. These are natural trading allies of Canada and yet our total involvement with the United States restricts, really, our trading with these countries.

Mr. Buchanan: Thank you, Mr. Chairman.

Mr. Hymmen: Mr. Chairman, would you allow a short related question?

The Chairman: These are supplementaries? Mr. Prud'homme and then Mr. Hymmen.

Mr. Prud'homme: Do you not think there is a difference in the geographical situation of Mexico and Canada? Surely strategically Canada is much more important to the U.S.A. than Mexico.

Professor Warnock: In the sense it is between us and the Soviet Union, you mean?

Mr. Prud'homme: That is right.

Professor Warnock: Yes, I suppose so.

Mr. Prud'homme: So the retaliation, the kind of retaliation that our colleague Mr. Buchanan was talking about, really could affect Canada while in Mexico it is a completely different subject.

• 1230

Professor Warnock: Except that the area which really is of vital concern to the United States is Latin America, and in Latin America the biggest thorn in the side of the United States is Mexico consistently. They have opposed the embargoes on Cuba, opposing breaking diplomatic relations, opposing kicking Cuba out of the OAS, and so on. There was constant concern in the Kennedy administration over Mexico. Mexico gets far greater attention in the State Department than Canada does.

Mr. Prud'homme: Yes, at the moment, because they do not see any military problem with Canada, but if we were to follow your views—mind you, I am just questioning; I am not giving my own opinions—referring to what you have said about how nationalistic the Americans could be, how would they feel

if suddenly they saw a 4,000-mile-long unprotected territory north of them for their security?

Professor Warnock: I think the government looks on these things perhaps in a different way. The government is realistic. They do not see that the Soviet Union is about to launch a ground attack against the United States across Canada. I mean, they are not even concerned about it. They do not even think about that. The only thing they fear coming across the North is the missiles and the planes, and Canada is not really important to that any more now with the ballistic missile early warning system outside of Canada, the over-the-horizon radar.

So Canada is not essential in America's defence as it looks North. I think what might disturb the United States is, for example, if say Quebec separated and a left-wing socialist government took over in Quebec. You know, at the time Project Camelot in the United States was exposed on revolutions in Latin America it was also revealed that Project Revolt was being studied by the army. This was a project on what to do about Quebec if the separatists take over and go socialist.

They even invited Canadian academics to come down to Washington to participate in this to advise the government on what action it could take in removing the separatists and the socialists in Quebec. That, I think, might disturb the United States, but I do not think just withdrawing from NATO and NORAD would disturb them.

The Chairman: I think we had better go on to a supplementary from Mr. Hymmen.

Mr. Hymmen: I have just a short question, Mr. Chairman. I think Professor Warnock answered Mr. Buchanan on possible discrimination from the United States. This is a related question. I think you suggested, sir, that our NATO involvement more or less serves no meaningful purpose. What about possible discrimination from our European allies? There is a military situation; there is the political and economic situations and, of course, Canada has had close ties with our European partners over many, many years. What about this question?

Professor Warnock: I suppose that is speculating. I doubt that it would affect our main trading relations with Britain, for example. Our trading relationship with the Common Market is not that great. I do not think it would be affected, sir.

[Interpretation]

Mr. Marceau: Mr. Chairman, something surprises me since we started this consideration of a possible review of our defence policy.

All the professors and the theoreticians have always seemed in favour of the withdrawal of Canada from alliances, whereas the military people, those who are involved in the defence policy, have always been in favour of some sort of a *status quo*, a smaller participation perhaps but an active participation nonetheless in the alliances, rather than a withdrawal. Is this because the military people are too fearful or the professors are lacking in practical sense?

• 1235

[English]

Professor Warnock: First, I would say that in Canada a majority of the professors, particularly in political science, would be in favour of maintaining Canada's role in NATO and NORAD. As far as the discrepancy between those of us who disagree and the military is concerned, I think the military naturally in every country are in favour of their military establishment, such as it is. I do not know of any military establishment in history that ever advocated that it be cut back.

Professors, perhaps, can have an opportunity to take a long-range view from a broad perspective and without personal involvement at what they consider to be the long-run national interests of the country; not just narrowly, but on a worldwide basis. They have the ability to devote a great deal of their own time to studying issues, far more so than anybody does who is in the bureaucratic side of the government, and perhaps they come up with different approaches because they are not personally committed.

I think anybody who gets involved in a policy, particularly in the formation of a policy, becomes committed to it. How can you expect people who have devoted their lives to the creation and maintenance of NATO suddenly say that they think it is obsolete? It is very difficult to think people would do that.

[Interpretation]

Mr. Marceau: So, following your line of thought, you have just said that you are better placed than others to carry on these studies. Would you tell me what studies you

carried out to come to such a categorical conclusion that we should withdraw from NATO and from NORAD, that Vietnamese war is a useless war and that, indeed, everything that exists should be replaced? What practical studies have you carried out? What comparative studies have you carried out to come to such categorical conclusions before a meeting such as this?

[English]

Mr. Warnock: As I say, the only advantage really is the time. Now I have devoted really the last five years of my life in academic work primarily studying Canadian foreign policy and defence policy since the Second World War. I have spent 15 years in university now studying international relations and foreign policy in general. Simply because I have been able to devote so much time gives me an advantage over other people. I was in the administration of foreign policy for two years and I realize that anybody that is in administration just simply is so occupied with day-by-day chores that they do not ever have the time, even to sit down at night and read books, to take a longer-run objective point of view. At the same time I do not expect that the people who have to make the policy are going to automatically accept the position of professors who are sitting off in their ivory towers studying these things, because they are not responsible. The people who are responsible are the government people and they have to make their decision.

[Interpretation]

Mr. Marceau: To sum up your answer, you have expressed an opinion rather than the result of a study?

[English]

Professor Warnock: This is my conclusion after spending 5 years analysing Canadian foreign policy. It is my opinion, yes.

[Interpretation]

Mr. Marceau: Now to come to a more specific question. According to you, would the new defence policy which Canada should have be more or less expensive than the one it now has?

[English]

Professor Warnock: Well, in defence per se alone it would cost less, because if you withdraw from NATO and NORAD you no longer have to maintain the defence establishment. If you do what I also suggest, transfer most

of that money to a foreign aid program, then you are just shifting the budget around a little bit. It is not going to result in the reduction in taxation or reduction in budget if this alternative policy is approved.

• 1238

[Interpretation]

Mr. Marceau: Do you not think that this new policy which the country should have ought to bring about expenses, and require new equipment and the possible replacement of the facilities which we now have within these alliances and which could be used, and which will involve necessarily more expenditures for the country? Do you not think that the best solution would be rather a readjustment of our policy, i.e. a lesser contribution to NATO or NORAD along with a role to be played by Canada in keeping and maintaining peace in the world? In other words, do you not think that radical solutions in the field of defence, as elsewhere, are not always the best ones?

[English]

Professor Warnock: Well, first of all, if Canada stays in NATO and NORAD it is in a position right now where most of its equipment is obsolete and will have to be replaced. If it is replaced this will mean a great deal of expense. That is, if we stay in NATO and NORAD now and maintain our policy as it is right now, we will have to buy new aeroplanes and new equipment for Europe. We can stay in and withdraw. For example, we could withdraw our brigade from Germany and bring it back to Canada. But then I think many people have proposed that if we do this and put it in the mobile NATO force this would require spending on more transportation to make it mobile to go to Europe. If we stay in NORAD and want to play a defence role, we are going to have to replace the F101 Voodoos and this will probably mean purchasing new aircraft from the United States, which will cost more money. The foreign aid program would not necessarily increase spending in Canada. One proposal would be to shift it through the United Nations which has the bureaucracy to carry that out.

• 1240

[Interpretation]

Mr. Marceau: Mr. Chairman, with all due respect for the witness, it is not true that we will have to renew our equipment completely,

because Canada has just carried out a campaign, over the past five years, which has renewed all our equipment. I do not think that this renewal has been complete, but I do not think it is true to say that we will have to renew our equipment. It has been renewed for some years, and I think that with a few extra expenditures, it could serve within NATO.

Now, another question, Mr. Chairman. Do you think that in the present state of things, it would be wise to take decisions that are as radical as those that you have proposed? Do you not think that it might be much more advantageous to take an attitude of caution, because the slightest step we may take may bring about a nuclear war?

[English]

Professor Warnock: Well, no. First of all, I do not think the proposals I made are radical. They are made by some very conservative people in both the United States and Canada. I do not think that withdrawal from the Alliance system would provoke any war. I think it is a policy which is not just a possibility, it is feasible, probable alternative. It is something that could be carried out, and could be accepted. I think Mr. Trudeau could do it.

One of the things about this whole review, and I think maybe you do not see it from where I see it sitting on the Prairies, is that so much has been made of the defence policy review in the press over the last year—and whenever the government has to make a statement they say, “Well, we are not going to make a statement until the defence review has been made”—that the people in Canada actually think there are going to be significant changes. I do not think there will be, and I think the attitude and the response of the public will be, “Why, after all this fuss over the past year, have we come out and said that the status quo is the best?”

An hon. Member: That is actually what we are going to say.

[Interpretation]

Mr. Marceau: Thank you, Mr. Chairman.

[English]

Mr. Ryan: Professor, I take it you would agree with me that if your foreign aid program went through we would have a much bigger balance of payments problem than we have with our brigade and our air division in Europe?

Professor Warnock: I do not know. I do not see why that would follow.

Mr. Ryan: Well, if we gave \$1 billion abroad for foreign aid, as against what we are presently doing in Europe in support of

• 1245

our brigade and our air division, would there not be a tremendous difference in our shipment of Canadian funds abroad?

Professor Warnock: Yes, if none of this money came back to Canada, but I think over 90 per cent of all the foreign aid money which we spend or give or loan now comes back to Canada in purchases—

Mr. Ryan: That is if it is through export credits.

Professor Warnock: No. I mean, if you give a country money, Canadian dollars, it is quite likely—well, right now we tie most of our aid and we would not have to do that. But I am not so sure about that.

Mr. Ryan: But your plan would be to do it on the basis of getting 90 per cent of the money used in Canada?

Professor Warnock: Well, I do not know whether this would have to be direct, you know—Canadian dollars usually come back to the country in purchases.

Mr. Ryan: I take it that you not only believe that the NATO and NORAD alliances have obsolete hardware but also that the whole concept of the two alliances is obsolete? Is this your position?

Professor Warnock: That is right.

Mr. Ryan: Then I take it that you would be prepared to terminate any overflight arrangements with the United States with respect to Canadian territory?

Professor Warnock: Overflights of what—Strategic Air Command overflights?

Mr. Ryan: Yes, or any that may be decided necessary by the American military.

Professor Warnock: Yes, I do not think the Strategic Air Command's overflights over Canada serve any useful purpose.

Mr. Ryan: Your view is that we should become as independent a country as possible and completely non-aligned. Is that a fair statement?

Professor Warnock: I think that non-alignment could be an immediate policy. And I certainly think that the long-run interests of Canada, once again, are to try to become an independent country in the real sense, you know. As long as the United States owns 60 per cent of our economy and as long as 70 per cent of our trade is with the United States we are not really independent.

Mr. Ryan: But you will agree that we are either second or third in the world in our standard of living.

Professor Warnock: Yes...

Mr. Ryan: I think probably we are the second highest.

Professor Warnock: No. I think we could drop to fourth, but we are right there.

Mr. Ryan: We are right up there, yes.

Professor Warnock: We are in the first three or four.

Mr. Ryan: We are far ahead of Mexico.

Professor Warnock: Yes.

Mr. Ryan: You have pointed out to the Committee that in certain emergencies we have not been consulted as a member of either NORAD or NATO, but would you agree that we are consulted before emergencies pretty thoroughly in most respects?

Professor Warnock: I do not know what you mean by "consulted". In a general overall policy, for example in the establishment of NORAD, obviously this is worked out between the two countries.

Mr. Ryan: But the way it is working out makes it unnecessary to consult us, does it not?

Professor Warnock: Well, maybe. But take for example the decision of the United States to go ahead with the anti-ballistic program. There was no consultation with Canada about that in advance...

Mr. Ryan: But that was within their own territory, of course.

Professor Warnock: But that is part of the NORAD system and it is part of the North American air defence. If it works it will explode bombs on Canada. This is of vital interest to Canada. Why was Canada not consulted in advance? They were not. It did not

even occur to the Americans to consult with Canada. Mr. Pearson says that we were informed a week ahead of time, but the Russians were informed at the same time. Our involvement in NORAD did not give us any special role in this.

Mr. Ryan: You are talking about official information now. But surely Canada and many of her military men knew that this development was going to come.

Professor Warnock: Yes, everybody knew it was in the offing.

Mr. Ryan: Yes, knew it was in the offing. And do you not think that we knew at all pertinent times that we had the option here.

Professor Warnock: Well, I think personally that the decision to go ahead within the United States was due to a domestic political problem. But you will remember that Defence Secretary MacNamara had firmly come down consistently against it all along, so nobody really thought the Americans were going ahead with it. But all of a sudden out of a clear blue sky, so to speak, it was announced that they were going ahead with it. I think Mr. Hellyer a week before had gone to Washington, not for that purpose but for another purpose, and he was informed at that time, about a week in advance, that the Americans had changed their mind and were going ahead to establish it.

Mr. Ryan: How important is it that we feel badly about this in view of what you say, that we would be plastered so hard by incoming missiles that there is really no defence? Why should we get upset about this American contribution.

• 1250

Professor Warnock: I am concerned about this because the major argument for our remaining in the Alliance is that we are consulted in advance and that we have a special influence on American foreign policy which other countries do not have. My point of view is that the record does not indicate this is at all true, even when you have a close bilateral relationship like NORAD which demands and specifically states that there shall be consultation ahead of time before policies are introduced.

Mr. Ryan: But you realize that we have our military men throughout bases in the United States being advised of everything that we need to know? You understand that?

Professor Warnock: Yes, I assume that.

Mr. Ryan: And would you not agree that if we become a non-aligned country our position in respect of consultation would become very pathetic indeed?

Professor Warnock: Well, I think the assumption is that you get something out of consultation. I mean, there is no sense in having consultation if you cannot influence policy. This is the position, for example, that de Gaulle took in the Cuban missile crisis when Dean Acheson came to see him. He said, "Are you informing me or are you consulting me?" and Acheson said, "We are informing you." He said, "Well, that is fine because there is a great difference between being informed of a matter and being consulted." As you will recall, at the time the anti-ballistic missile system was first announced and that they were going ahead with it, it was not even known at that time or announced whether Canada would be a part of it or would not be a part of it. In fact, the original maps that were leaked to the press showed one of the missile sites was going to be at North Bay, Ontario. This obviously was the American position—they wanted one there. And it is very logical that one be at North Bay, Ontario. But then the government had to make up its mind quickly whether it was going to be a part of the ABM system or not and whether the ABM system was going to be a part of NORAD or not. The Canadian Government still says it is not a part of NORAD and the Americans say it is part of NORAD. It seems to me the whole atmosphere surrounding this decision indicates that in the real, true sense Canada had not been consulted.

Mr. Ryan: In your written submission, Professor, you say that two countries, the United States and Russia, might conceivably attack Canada. These are the only two that you can conceive at the present time would attack Canada. If we became a non-aligned country at this point, then I take it that it would be necessary, in your opinion, to arm against these conceivable attack threats. Therefore, we should perhaps develop our own nuclear weapons, have our own anti-ballistic missiles, our own missile silos under the sea off our shores, undersea bases and so on and so forth.

Professor Warnock: No, it is quite the opposite, and this is where I disagree strongly with the statements Mr. Sharp has made. In

my opinion Canada cannot defend itself against either, even if it maximized through every cent possible its defence system. It could not in any way create a defence policy, an establishment which could resist an attack by either the Soviet Union or the United States; therefore it would be a complete waste of money. I mean that if you cannot defend against the possible attackers there is no sense in having a defence and that therefore it would be a complete waste of money. And so I would not agree with statements made by Mr. Sharp and others that if we became non-aligned we would have to build up an even greater military system.

Mr. Ryan: Well, now, you say that we might conceivably be attacked by the United States.

Professor Warnock: It is a possibility.

Mr. Ryan: Would this be so, in your opinion, if we continued with our NATO and NORAD arrangements? Would this not knock out the conceivability of a U.S. attack?

Professor Warnock: The only conceivable attack I would think of would be—and of course this is broad speculation and something which may be entirely impossible or inconceivable—in the event that Quebec became independent and became a left-wing government. The United States might consider this a real threat to their security as they did the possibility of left wingers taking over the Dominican Republic and might intervene in Quebec. I do not think it would have anything to do with whether or not Canada was in NATO or NORAD. As far as I can see that would be the only possible case where this might happen, and from the American point of view this is the only possible case which they see also.

Mr. Ryan: Why do you say, Professor, that China is a greater threat to world peace, in your opinion, than Russia?

• 1255

Professor Warnock: I think it is because in world politics today the Soviet Union is following a policy of peaceful co-existence. The Communist Party throughout the world, which is still aligned with the Russian foreign policy line, particularly in Latin America, is in effect arguing against wars of liberation, revolution, etc., whereas Chinese policy is to encourage wars in the underdeveloped world, all around everywhere. It is their strategy

and therefore in the minds of Canadians and Americans, the great threat in the world is that China is promoting and encouraging wars of national liberation around the world, whereas the Soviet Union is not—it is opposing these openly. As an American diplomat said, the most counterrevolutionary force in Latin America is the Russian Communist Party, the official Communist Party.

Mr. Ryan: That is not the message I get. The message I get is that it is Russia that instigated the Korean war; it is Russia that is the main backbone of the effort by Ho Chi-Minh against the Americans in South Viet Nam and the South Vietnamese; and that it is Russia that is tying in with Cambodia and that part of Laos which is joins at the border and giving the main problem. Ho Chi-Minh does not work with the Chinese; he will not admit them to the country though he will take aid from them, of course. It is the Russians in the Middle East who are doing the instigating in Syria and Egypt and Algeria. It is Russia's fleet that has been increased to be the second biggest fleet in the world. And it is Russia that is pressing in and filling every vacuum, and not China. China has too much in its own backyard to worry about, with revolution and chaos in every province practically. What do you say to that, Professor?

Professor Warnock: I would say it is certainly right that China in actual policy is limited to Asia. In Latin America the support is mainly a distant ideological commitment. In the Middle East certainly the Soviet Union has given encouragement to the Arab position. They see there is more to be gained from backing Arabs than Israel. But it is significant that in all these countries such as Egypt the Communist parties are outlawed.

No, in effect, they are not increasing Communism in the Middle East; they are just taking a strategic position in the Middle East. They think they have got the Americans backed in a corner because the Americans are in the position of having to back Israel, and there is more to be gained in the long run, they figure, by backing the Egyptians.

Mr. Ryan: And there is a lot for them to be gained, is there, by sending their fleet around to the Far East and Indian Ocean and those parts and in trying to fill in the British retreat—evacuation would be a better term.

Professor Warnock: You mean the Russians?

Mr. Ryan: Yes, the Russians.

Professor Warnock: They have some fishing fleets and spy ships around the world, yes. Most big powers do.

Mr. Ryan: Thank you, Mr. Chairman.

The Chairman: Before calling the next questioner, could I get the agreement of the Committee to print Professor Warnock's advance presentation as an appendix to this day's Minutes of Proceedings and Evidence?

Some hon. Members: Agreed.

The Chairman: Also, the special meeting this evening to discuss our procedure and agenda will take place in this room at 8 o'clock. I hope it can be brief. I still have Mr. Groos, Mr. Cafik and Mr. Legault. Mr. Groos.

Mr. Groos: A very short question, Doctor. You said that Canada's political influence would increase if we were to withdraw from NATO and NORAD and to devote the funds that have been allocated to those two associations to foreign aid. I think you then went on to say that foreign aid would be channelled, you thought, through the United Nations Industrial Development Organization Assistance Program, the Commonwealth francophone, the OAS, although you did not want us to join the OAS. I should think that Canada's political influence might decrease if we were to withdraw from NATO and NORAD, but I would be interested to hear more specifically where you think it might increase, particularly if our economic funds were to be channelled through the U.N.

Professor Warnock: When I was saying that we should become non-aligned I also associated that with a positive policy of activities through the United Nations in a diplomatic way and through other non-aligned blocs which already exist, and presumed that Canada's influence would increase in areas of the world other than Western Europe. I am not

• 1300

saying that it would be increased with the United States or in Western Europe, but in the rest of the world I think Canada's political influence would increase because Canada is somewhat limited now because we are so closely associated with the United States. Again this is presuming that we want to play a positive role in foreign policy—I am not sure we do.

Mr. Groos: You cannot be any more specific than that?

Professor Warnock: Would you want me to cite examples?

Mr. Groos: Yes, I would.

Professor Warnock: For example, in the Middle East we are not even acceptable anymore as part of the United Nations Emergency Force in the Suez because we are so totally associated with the United States in Israel's policy. We are becoming less and less acceptable as a peacekeeper in the United Nations because we are associated with NATO. The peacekeeping operations in the United Nations automatically exclude the Warsaw Pact nations, and now there is a movement also to exclude the NATO countries.

Another example is that Canadian troops were not acceptable in the Congo, whereas Austria, Ireland and Sweden's troops were because they were non-aligned and we were aligned. The only force we contributed to the Congo was the Communications Unit because it was bilingual and they had a great need for a bilingual communications unit.

For example in the United Nations there was a period of time when Canada, probably before 1955, played a moderating role with other small parts, but this diplomatic initiative has been completely eclipsed by the non-aligned bloc. All the proposals for moderation, change, compromise, etc., come from the non-aligned block and Canada is not in that. The only caucus Canada is in in the United Nations is the Commonwealth caucus when it meets, which is not very often and the NATO caucus. And thus, Canada has ceased to be a leader in compromise in the United Nations and has become more and more associated with NATO projects. It was not asked, for example, to sign the Afro-Asian moderate positions compromising between the East and West. I would say that if we were to become non-aligned there would be a more positive role for Canada to play similar to that of Sweden, Ireland and Austria and this would increase our influence in this agency rather than decrease it.

The Chairman: Mr. Cafik?

Mr. Cafik: Professor Warnock, you have made some rather startling observations, I think. I am rather inclined to think that they are a bit naïve. You suggest—at least I have this impression—that Russia really does not have an expansionist policy. You suggested at one time—and I think I quote you correctly—that Russia wants to achieve its victories in other nations through the electoral system; in

other words, to win by election. It seems a rather odd approach when they have never done it before, including in their own country. You have suggested a lot of things along this line and it leads me to conclude that that academic ivory tower that you sit in is extremely well insulated from reality.

Mr. Brewin: Mr. Chairman, on a point of order, is the witness being questioned or harangued? This is an attack...

The Chairman: Perhaps you could get on with your question.

Mr. Cafik: Yes, if you do not mind, I will ask the question. Now, these are my observations and I wonder if they are accurate—I do not want to misinterpret anything that you have said. Did I express your view rather correctly that you do not really think that Russia has expansionist designs on Europe and other parts of the world?

Professor Warnock: In the military sense?

Mr. Cafik: In the military sense.

Professor Warnock: No.

Mr. Cafik: I agree with you to some extent. I do not think they are trying to achieve them militarily today, but perhaps the reason for that is the military alliance of the allies. In other words, they see that they could not be successful in pursuing these objectives in a military way.

Professor Warnock: Yes, that is an interpretation you could draw. The fact that Russia has not invaded Europe in the last 20 years, or not invaded Germany, could be attributed to NATO's existence. Personally I feel that even if NATO had not been there, they would not have invaded Europe. I just do not think that they ever had that as a policy.

• 1305

Mr. Cafik: You suggested earlier, too, when you were talking about a justification for this position, that they were not doing so because they had enough trouble with their own allies, the Warsaw Pact powers.

Professor Warnock: Currently.

Mr. Cafik: That is right, and that this would deter them from trying to expand further because they would only increase the number of headaches they had.

Is this one of the reasons why they would not want to expand?

Professor Warnock: No. If you were thinking, for example, of launching an aggressive policy against Germany, you would naturally want all your allies in Eastern Europe—you have to go through them—to be with you. And if they were not going to be with you, you would certainly have second thoughts about undertaking such a policy.

Mr. Cafik: And you feel that they hesitated because they did not think the Warsaw Pact powers would back them up in that decision?

Professor Warnock: You mean over the years?

Mr. Cafik: Yes.

Professor Warnock: Oh, no. I do not think it was ever a policy. First of all you have to look at the situation that Russia was in at the end of the war. I do not know whether it is worthwhile going back that far, but here was Russia, if you read in Kennan's memoirs his description of going from Moscow to the West at the end of the war, totally devastated with not a thing standing. An economic analysis of the situation in Russia at the end of the war reveals that economically it was about what the United States was around 1860. It was just totally destroyed. What the Soviet Union was intent on doing in the immediate period after the war was to build up Russia. It would be the same thing if the United States had been burned to the ground from the Mississippi to the Atlantic Ocean. Would the United States have been as powerful in the circumstances? No. In fact Kennan makes the point in his own memoirs that Russia was extremely weak at this time, and he says that nobody in his right mind would have thought that the Soviet Union was involved in an expansionist military policy at that time when it was so incredibly weak. And similarly it was at a time when the United States had a monopoly on atomic bombs. So to think that under those circumstances the Soviet Union was about to invade Europe was, in Kennan's own words, nonsense.

Mr. Cafik: Yes, but I do not think that that means that it did not have the desire to do so, but perhaps not the means to do so, or perhaps it saw sufficient deterrent in the United States that it could not pursue this objective.

Professor Warnock: Well, in a sense, Russia being a closed society, it is a matter of trying

to guess what their policy was, and it is a disagreement among guesses; you and I happen to disagree.

Mr. Cafik: I think this is my last question: one other point you made was that the United States and Russia were the only possible enemies, as it were, or people who could attack Canada, and I presume by that you mean successfully attack Canada, and I am inclined to agree that could well be so. You draw the conclusion, then, that we should thereby cut down our alliances and put ourselves in the position where we would be at the mercy of one or the other, or both. It would seem to me a rational thing to do, under that circumstance, to at least cut your options in half. If there are two possible people who could attack us, by allying ourselves with the United States at least we would cut out one of them, and would only have one who could possibly do it. I think, really, that is our position, that we have thrown our weight in with the United States and that we will stand or fall as they stand or fall in this connection.

Professor Warnock: Yes. I agree that is what has happened and I do not agree that it was the right policy. I think that our policy should have been, right from the beginning, at the end of World War II, to do everything possible within Canada's means to minimize the possibility of a war between the Soviet Union and the United States. I feel that by aligning ourselves with the United States, over that period, we did nothing to minimizing this. If anything, we probably increased tensions and if we had been a real buffer zone, if we had done everything diplomatically—I am not saying we could have done this or whether the people would have approved it—if we could have devoted everything in a diplomatic effort to moderate tensions between East and West, it would have been more in the long-term interests of Canada than militarily aligning ourselves very closely with the United States.

Mr. Cafik: Do you not feel that the alliances that we have been involved in have been very successful, at least in the short haul. In the long term I do not really know. But we have not had a nuclear war. We have certainly maintained a free Europe as a result of those alliances. Perhaps you would say that it would have been anyway, but I do not particularly agree. I think we have curtailed the expansionist desires of Russia, in a military sense; we have not seen too much of that in a

direct sense. That, it seems to me, must be the result of something.

Professor Warnock: I say it could be attributed to NATO; I am not convinced of this. Of course, it is just a matter of judgment whether it has been as a result of NATO or not, or whether what really deterred them was the fact that the United States had a nuclear bomb with the capability of blowing up the Soviet Union. That may have been the real deterrent, if you assume that they were intent on a policy of military aggression in Europe. I do not agree with that.

Mr. Cafik: Thank you, Mr. Chairman. Thank you, Professor.

Mr. Legault: I have two short questions Mr. Chairman. In your opening remarks, Professor, you did mention, and this has been underlined by Mr. Cafik and I believe by Mr. Ryan, that Russia at the moment was encountering some difficulties, and as far as you were concerned it is getting weaker because of its headaches with the Warsaw Pact countries. I was left with the impression from those remarks that you did not believe that Russia was an aggressor anymore. Mr. Ryan has certainly underlined the fact of all the activities going on throughout the world. But in your paper you suggest that the Arctic area be used internationally in a mutual missile and bomber detection system which would provide information to both sides. This is the plan that you would adopt that we be impartial on both sides and merely be an informer to both sides as to what could possibly happen. You understand that this would break our affiliation with the United States entirely.

Professor Warnock: No, I think the United States is in a position now where it really wants to promote a détente with the Soviet Union and is looking at this. One thing that really inhibits this is the Vietnam War. If it were not for the Vietnam War, I think that you would have seen a great deal more initiatives towards peace and co-operation with the Soviet Union over the last few years. I think this is one area where we could open up an opportunity. It may not be a really great significant thing, but it would be an opportunity to create a new area of compromise.

Mr. Legault: Do you believe, Professor, that the United States are aggressors in any sense, because by this you suggest that the possibility is as much that the United States

would launch a nuclear attack as would Russia.

Professor Warnock: I think it is a feasible policy that you have got to take that into consideration. For example, in Robert Kennedy's book *Thirteen Days*, he mentions that Secretary to the Air Force, at that time, who was Curtis Lemay, suggested at the time of the Cuban crisis that the United States immediately launch a nuclear attack upon the Soviet Union. All during the whole controversy over what to do about Cuba with the missiles there, the military as a unit consistently said that the only solution was an attack and an invasion of Cuba. So, the military are sort of conditioned to think in terms of using the military to solve problems.

Mr. Legault: Using it as a defence.

Professor Warnock: Well, I do not know; they may be.

Mr. Legault: What you are saying necessarily is that the world has to fear the United States as much as it has to fear Russia.

Professor Warnock: I think the world has to fear nuclear war and take precautions, and we should do everything we can to make sure that neither the United States nor the Soviet Union ever want to, or are in a position where they feel they ought to, use their nuclear weapons.

Mr. Legault: I have a question which follows this statement that we should pull out of any participation in those: do you believe that Canada should increase substantially its monies in civil defence—I am referring to EMO—because of the description of the devastating dangers and effects of a nuclear attack where Canada would be the victim.

Professor Warnock: Yes, if you are looking at it in a realistic sense about what can Canada really do to defend itself, then you have to take into consideration what are the probabilities of an attack, and the greatest threat to Canada is the possibility of a nuclear war between the Soviet Union and the United States. This is the greatest threat to Canada's existence.

Under those circumstances the most logical thing, if you want to spend money on defence, would be to spend it on survival, in this case. I am not convinced, as I mentioned before, that if we ever got to the point where

nuclear weapons were being used in an all-out attack between the Soviet Union and the United States it would make much difference whether we had fall-out shelters or not, because I think when you get to the magnitude of the number of weapons that are being used, if such a situation ever occurred, that, as Herman Kahn said in his first book, the living will envy the dead.

Mr. Legault: Thank you very much, Professor.

The Chairman: I would like to ask one question, Professor Warnock. I understand that the United States does provide through its forces for the defence of Canadian territory to some extent; I believe this is air defence in Western Canada. Are you familiar with the details of the defence that is provided for Canadian territory by United States forces, and can tell us what they are?

Professor Warnock: They have contingency plans. For example, in the Cuban missile crisis they asked to transfer American interceptor planes into Canadian territory, and this was denied by the Government. As far as the specific plans are concerned, I have not seen these as they are available to people only on the basis of need to know. Even when I was in the State Department I did not see those plans. However, they do have all kinds of plans: for example, they even have plans as to what they would do if the Russians invaded Canada. They have plans for every possible situation.

The Chairman: But is not the American Air Force now providing for the defence of Western Canada? Do you know this?

Professor Warnock: I would think so because the Canadian interceptors are stationed in British Columbia and North Bay with nothing in between. If you look at the defence force you can see that the Canadian interceptors do not have the range to cover that area. So that, in case there is a bomber attack, that area, because of the location of the Canadian interceptors, will be defended, if it can be called that, by American interceptors based in North Dakota and Montana and so on.

The Chairman: Mr. Anderson, did you have a second line of questioning?

Mr. Anderson: No, not a second line. I would like to follow along with the last line

that I had. Would you say, sir, that the Alliance for Progress has been a success?

Professor Warnock: No.

Mr. Anderson: In your earlier statements you indicated that it was only set up for one thing: to prevent violent revolution and to prevent Latin America adopting Chairman Mao's thesis of revolution followed by . . .

Professor Warnock: Yes.

Mr. Anderson: So you think it has been a failure. Does this mean that you expect a series of Cuba's throughout Latin America?

Professor Warnock: The Americans themselves are now admitting—the government last year admitted that the Alliance for Progress had been a failure. I do not know what will happen in the long run in Latin America. There are about eight countries in Latin America now which have very small revolutions going on. I would predict that in the next twenty years, since the economic conditions and the standard-of-living of people in Latin America is not improving in any way—in fact, it is deteriorating; that is, the food available on a per capita basis in Latin America is declining every year—these guerrilla wars will increase and perhaps become more intense.

Mr. Anderson: I certainly would not disagree with you on that. Do you feel, however, that by a fairly massive increase in aid to that area, through the Alliance for Progress or any other revitalized area development programme, we can prevent such a thing? Or do you feel that because of the social structures existing in many of these countries, and I admit that there are many different types, it is impossible to achieve the development that the Alliance for Progress, for instance, was set up to achieve?

Professor Warnock: I think Latin America is much more difficult than any other area in which to bring about meaningful change. This is one of the great frustrations of the Alliance for Progress in the first two years, particularly, that the original Punta del Este Conference, which established through the OAS the Alliance for Progress programme, called for the Latin American countries to make major reform in land distribution, in tax reform, and to tax the rich. Most of the rich are not taxed in Latin America. Most of the land is

not taxed. In case after case, when put to this test, the governments in Latin America refused to carry out the reforms and it was very frustrating for the Kennedy administration to see that their aims, in effect, were frustrated by the unwillingness of the, I think it is fair to say, particularly in Latin America's case, the entrenched oligarchy's refusing to make any changes at all in the situation.

Mr. Anderson: I certainly agree with you in what you have said. It is my impression, too. However, you did suggest earlier on that we devote as much as we could to external aid in an attempt to avoid revolutions of this type. Yet, you agree with me that revolutions are probably quite inevitable in Latin America. Can you take this one step further, that really and truly should we now re-examine our original premise and see if we should attempt to avoid such things.

Professor Warnock: First of all, if we are going to have a selective policy for example, wherever we give our aid, I would not have stressed Latin America except, for example, the British Commonwealth areas in the Caribbean. I would have stressed the Commonwealth underdeveloped countries, the Francophone underdeveloped countries. I think more can be done there than in Latin America, and particularly, since the United States has this overwhelming interest in Latin America, that you are really meddling in what the Americans consider to be their particular interest. I think Canada could be much more effective, in a positive way by trying to create political, commercial and economic ties with areas other than those which are under the control of the United States.

Mr. Anderson: Do you think there is much possibility of non-communist revolutionary movements developing in Latin America? By this I do not simply mean palace revolutions of generals. I mean revolutions whereby there is a total change of the social structure and yet they do not necessarily follow the Cuban or Chinese pattern?

Professor Warnock: I do not know, really. It is hard to say because of the re-action now. For example, the Cuban revolution was essentially a middle class revolution of college students who were millionaires' and doctors' sons. This is why all during the revolution the communist party in Cuba opposed it and said it was just a bourgeois revolution. After

these bourgeois nationalist revolutionaries got into power they began to nationalize American business and they were pushed more and more to the left and when Castro—and you have to understand Latin American terminology—announced in December, 1961 that he was a Marxist this was, in effect, a way of saying “I am not a communist. I am a revolutionary”. At no time did he or Guevera, or any of these people, associate with the communist party because they think the communist party is sold out, that it is a counter-revolutionary group, and they have consistently held this view from 1954 on. They have strenuously opposed the communist party in Latin America because it was historically aligned with Russia, following Russia's foreign policy line, and therefore would not give any aid. For example, in the Bolivian revolution, the tin miners in Bolivia, are all members of the communist workers union, and on orders from Moscow they gave no support to Guevera. The tin miners are armed, and if they had given full support to Guevera his revolution would have been successful.

Mr. Anderson: This certainly appeared from his diary. You think then that there is quite a possibility in Latin America for what I am describing as the policy of self reliance a sort of internal regeneration which might not be communist.

Professor Warnock: The strongest move, I think, sitting here and reading about it, in Latin America is nationalism and anti-Yankee attitudes and so forth. As you know, many writers and Latin Americans say that all Latin American nationalists believe in nationalization because they believe that the only way you are going to control your economy is to nationalize the American and foreign business.

It does not particularly mean that they are communists. It just means that they believe in national control of the economy.

Mr. Anderson: The Peruvian generals have proved that.

Professor Warnock: Yes, in Peru.

Mr. Anderson: One final question. I am sorry to have taken so much of your time. You stated that we should attempt to expand trade with Japan and China. Having served in that area as Assistant Trade Commissioner for three years, I am extremely curious to have your ideas on where these great oppor-

tunities for trade are. Personally, I think that trade with China, for example, goes entirely to the person who can provide the best deal. The classic example of this is West Germany which has the best possible trade relations with China while other nations fall a bit by the wayside. Do you honestly feel that there is some unexplored area of trade in the Far East which somehow if we look less to the United States we would be able to find. Is it simply a question of Canada not being aggressive enough in that area?

Professor Warnock: You probably know a lot more about this than I do, but I think it is also a problem that most of our trade is already with the United States, and much of this trade is dictated by the branch plant system.

Also, Japan has very strict trade controls. They will not import more than they will export, and then you have got to convince the manufacturers in Canada that they should allow into Canada what they consider to be cheap Japanese goods in order to promote a balanced trade back and forth. The same with China, and until Canada makes a positive effort to increase imports of manufactured

• 1325

goods from China and Japan, then the trade will probably remain the same.

Mr. Anderson: I certainly appreciate your comments. I must say I disagree entirely on those last two points. Both Japanese and Chinese businessmen and government officials with whom I have discussed this have been fully aware that you only balance things on over-all terms, and the Chinese no more wish to balance their trade with us than they would want to balance it with Hong Kong where they have a tremendous surplus, just as with Canada they have a serious imbalance against them.

Professor Warnock: You do not think they would want to increase their exports.

Mr. Anderson: Certainly they would, but this would not necessarily give us more opportunity to sell there. It is just an observation. Thank you very much.

The Chairman: Gentlemen, if there are no other questions, on your behalf I would like to thank Professor Warnock for a very helpful and a very interesting presentation. Thank you Professor Warnock.

APPENDIX MM

Canada's Role in North American Defence

by John W. Warnock

It is useful for every country to review its foreign and defence policy every few years, for international conditions change rather rapidly. A defence policy must always be based on a realistic assessment of the long term interests of the country. Planning must concentrate on probabilities and not be prejudiced by habit which has developed over the past. Furthermore, all programmes develop vested interests, and defence institutions have not escaped Parkinson's Law. In Canada, as in most countries, resources are scarce and demands are great in many areas. A government formulating its defence programme must recognize the other demands and needs; since defence spending is not as productive as spending in other areas, a government must be certain that the existing and new programmes serve an absolutely essential function.

A military establishment exists to protect and defend the state. There are only two countries which might conceivably attack Canada, the United States and the Soviet Union. Some might speculate that in the distant future China could become a military enemy of Canada, but this stretches the imagination. But what we have feared most in recent years is a war between the United States and the Soviet Union. In the era of nuclear weapons, delivered by missiles and bombers, Canada would be caught in the middle because of our geographic position and would most probably become a nuclear "no-mans land".

But the central reality for Canada is that we cannot defend against an attack by either the Soviet Union or the United States; we do not have the resources for a defence. Secondly, it is also quite clear that there is nothing that could be done to protect Canada in case of a nuclear exchange between the United States and the Soviet Union. There is no defence, in the classical sense, in a nuclear war. Even before the advent of the Intercontinental Ballistic Missile (ICBM), both countries had the capacity to rain unacceptable devastation on each other.

Soon after World War II, beginning as early as 1946, the Canadian government decided that our security could best be maintained by a close military alliance with the United States. Our defence was integrated into the American defence system whose primary function was to detect a possible Soviet bomber attack on the United States. This development culminated in the signing of the NORAD agreement in 1958.

However, the North American defence system included acceptance of the belief that the United States could be *defended* against a bomber attack from the Soviet Union. Thus, over the years, tremendous amounts of money have been spent on developing interceptors and missiles. In reality they could never have provided an acceptable defence for North America. The defence system could not have shot down more than 50% of the incoming bombers, and in the 1950's that meant that most of the likely targets would not have escaped devastation. Furthermore, it was never a necessary part of the deterrent system, the U.S. Strategic Air Command: the radar detection system was adequate to give notice of the approach of Soviet bombers.

Significantly, the Soviet Union launched Sputnik I the month before the NORAD agreement began; it symbolized the end of the bomber era, and the real beginning of the period of the balance of terror. There is no defence against the ICBM. Even the Anti-Ballistic Missile (ABM) system being considered by the United States will not provide any meaningful defence.

As early as May 17, 1965, Robert McNamara, then U.S. Secretary of Defense, proclaimed the NORAD system to be obsolete. In February 1968 he called for the phasing out of the old radar lines and the introduction of the Airborne Warning and Control System (AWACS). The only real purpose of the NORAD system today is to provide a warning against a Soviet missile attack. Is Canada's continued membership in NORAD necessary for this function? Does Canada's membership make the American deterrent more effective?

First, the Ballistic Missile Early Warning System (BMEWS) is operated outside Canada: at Clear, Alaska; Thule, Greenland; and

Fylingdales Moor, England. No Canadian participation or territory is necessary for this operation. The only aerospace contribution that Canada makes is the Baker-Nunn camera sensor at Cold Lake, Alberta, which could easily be moved to the United States. Furthermore, the United States now has in operation the new over-the-horizon radar, operated from stations in the United States, which is far better than the odd anti-bomber and BMEWS system.

According to the latest estimates from the U.S. Department of Defense, released in January 1969, the Soviet Union has approximately 800 ICBMs and is converting these to multiple warheads. They have at least 30 nuclear submarines capable of launching missiles on the United States. In case of a war between the Soviet Union and the United States, would there be anything left of the Canadian defence system to shoot down the Soviet Union's 155 bombers? Would there be anything left for the Soviet bombers to bomb? It is about time the Canadian people admitted that their annual expenditure on the North American defence system is a complete waste of money.

However, I would also challenge the current approach to defence on a more fundamental basis: as a basic approach to peace. Is it the best way to protect Canada from a nuclear exchange that would probably mean the total devastation of the populated areas of our country? Nuclear war threatens the very existence of Canada, and our government is charged with the responsibility of minimizing the possibility of a war between the United States and the Soviet Union. In my opinion, our decision to join in the defence arrangements with the United States has not lessened tension between the two giants but probably has increased it. Permitting nuclear-armed bombers from the United States to fly on "fail-safe" missions over Canada up to the border of the Soviet Union could only be described as dangerous. Canada has not served as a buffer zone in this conflict; we have served as an extension of the United States military system. Therefore, we have brought the confrontation between the United States and the Soviet Union that much closer to conflict.

Under the present balance of terror, it is important for Canada to make sure that the

deterrence system works *both ways*. We want to be certain that neither the United States nor the Soviet Union is able to launch a surprise attack on the other country. Therefore, it would seem to make more sense for Canada to take direct initiatives in this area for the promotion of stability. Canada could suggest that the Arctic area be used internationally in a mutual missile and bomber detection system. This is not a new proposal;¹ it has been suggested in the past but ignored by Canadian officials. Perhaps it would not be military meaningful in present circumstances. But it would be a token move towards peace, similar in impact to the 1963 agreement to ban atmospheric nuclear tests.

Canada could also revive discussion for demilitarization of the Arctic area. In 1958 President Eisenhower proposed one plan for Arctic sky inspection which was presented to the U.N. Security Council by Dag Hammarskjöld.² There were several drawbacks to this proposal; on the whole it seemed to present an advantage to the United States, for there were few U.S. airbases outside Alaska in the area to be covered while it was presumed that the Soviet Union maintained many more airbases in the Arctic circle. However, another proposal was put forth in 1964 by two scientists, Alexander Rich of the United States and Alexandr P. Vinogradov of the Soviet Union.³ This proposal called for a three step plan for possible complete Arctic disarmament, which would involve Norway and Sweden as well as Canada. Canada should be sincerely interested in reducing tensions between the United States and the Soviet Union; an initiative could be made in this general area.

In summary then, it is my belief that the present Canadian contribution to the "defence" of North America is unrealistic, obsolete and wasteful, and could be eliminated without endangering the American deterrent in any way. Furthermore, I do not believe that

¹ For example, see Harry Pope, "Let the Russians Use the DEW Line Too", *Maclean's*, December 1959, pp. 10, 60-61.

² For a summary, see Trevor Lloyd, "Open Skies in the Arctic", *International Journal*, XIV, No. 1, Winter 1958-59, pp. 42-49.

³ Alexander Rich and Alexandr P. Vinogradov, "Arctic Disarmament", *Bulletin of the Atomic Scientists*, XX, November 1964, pp. 22-23.

military integration with the United States is the best approach to building peace between the Soviet Union and the United States. New policies and initiatives could be undertaken by Canada, and it is quite likely that they would be welcomed by the United States. Certainly the money saved could be spent in more productive programmes, both at home and abroad.

Pursuant to Standing Order 65(4)(b):

¹ Mr. Buchanan replaced Mr. Groos on February 26, 1969.

MINUTES OF PROCEEDINGS

(Text)

THURSDAY, February 27, 1969
(46)

The Standing Committee on External Affairs and National Defence met at 11:05 a.m. this day. The Vice-Chairman, Mr. Ryan, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Brewin, Buchanan, Cafik, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Howard (*Okanagan Boundary*), Legault, MacDonald (*Egmont*), MacLean, Macquarrie, Marcceau, Nowlan, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Stewart (*Cochrane*), Winch (23).

Also present: Messrs. Groos and Hymmen, M.P.'s.

Witness: Professor Albert Legault, Visiting Professor, Chair of Strategic Studies, Queen's University.

On motion of Mr. Winch,

Resolved,—That reasonable living and travelling expenses be paid to Dr. Theo Sommer and Professor J. Granatstein, who have been invited to appear as witnesses before the Standing Committee on External Affairs and National Defence, in the matter of its Order of Reference dated Thursday, January 16, 1969.

The Vice-Chairman introduced the witness, Professor Albert Legault. Professor Legault made an opening statement.

Members questioned Professor Legault on various aspects of defence policy.

It was agreed that Professor Legault's advance presentation entitled *NATO: A Vital And Necessary Organization*, copies of which were distributed, in English and French, and his biography, be printed as an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix nn*)

At the conclusion of the questioning, the Vice-Chairman thanked Professor Legault for his testimony.

The Committee adjourned at 12:50 p.m., until 8:00 p.m. this day, when the witness will be Dr. Theo Sommer.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Thursday, February 27, 1969.

The Vice-Chairman: Please come to order.

• 1110

I would like to inform the Committee that we will be setting aside 15 minutes this evening for a discussion of our plans for the itinerary in Europe and our voyage commencing on March 8 next. We will try to answer any questions at that time.

Mr. Brewin: Is that an in camera session?

The Vice-Chairman: No, this will be a session to hear the presentation of Dr. Sommer.

Mr. Brewin: It does not make much difference because usually the important—

The Vice-Chairman: I do not think we can hear you, Mr. Brewin.

Mr. Brewin: I was just asking you whether the session this evening to discuss the arrangements was in camera, and then suggesting it does not make much difference at any rate because apparently what we carry in camera is fully reported by members.

The Vice-Chairman: I think this might just as well be carried on in camera. It concerns just the petty details of the voyage.

Mr. Brewin: I am looking at you, yes.

The Vice-Chairman: Let us have a little order. I do not think we want to get into that matter at the moment. I would like to introduce now...

Mr. Anderson: Mr. Chairman, I have a question of personal privilege. This has been brought up on two occasions by other members of this Committee and I think if they get the Minutes of the last open meeting we had they will find a statement of my views there which is perfectly public for anyone to read. Not only was it a public statement, it was publicly recorded, so I think perhaps Mr. Brewin's comments are out of order.

Mr. Brewin: If I have done the member any injustice I will withdraw them.

Mr. Anderson: Good.

Mr. MacDonald (Egmont): I would like to follow up this comment.

The Vice-Chairman: Mr. MacDonald, on a question of privilege.

Mr. MacDonald (Egmont): There seems to be some confusion about whether, once an in camera meeting is concluded, members are free to give their individual views of what they either said or what happened in Committee. I am not referring to any particular situation, but it does seem to me that there is some confusion about whether or not there shall be comments by individual members concerning what went on and what was said.

I think there should be some general agreement by the Committee about whether or not there shall be simply a statement of the decisions made by the Chairman or whether it is open to members of the Committee to express views about what went on and what they said, or anything else that was said.

The Vice-President: Mr. Cafik.

Mr. Cafik: Mr. Chairman, on this point, I too was a little bit disturbed. This happened in another committee, if I may relate what happened there, and I think we came to a good conclusion. After an in camera meeting of the Public Accounts Committee and interview was given to radio and television, outlining what had happened, and so on. I raised this as a point of personal privilege at that time and we came to the conclusion that we did not think anyone had really made any mistake, but everyone at least should have understood the rules of the game.

We concluded that in subsequent in camera meetings, at their conclusion a decision would be made concerning what the Chairman was allowed to announce in terms of conclusions reached in that in camera meeting. I suggest

that is what we ought to do here. At the conclusion of in camera meetings we should come to a conclusion about what is going to be told to the press otherwise there is no point in having an in camera meeting.

The Vice-Chairman: Mr. Winch?

Mr. Winch: Then I take it that all hon. members would be in favour of postponing this discussion until this evening at which time we will have an in camera meeting and decide.

Mr. Anderson: Excuse me, Mr. Chairman. I do not think that is the point at all. I think we should discuss it and finish with it now. Both previous speakers have mentioned "once a meeting is concluded," As I said, if he will get the Minutes of the previous public meeting which took place in the morning of the day that we had the in camera meeting in the evening, he will see a perfectly clear statement of my position.

I do not see, if we have an in camera meeting subsequently to discuss something which has already been raised and fully explained, why a personal view which may or may not have been expressed in the in camera meeting but certainly is the view of the member should not be discussed with anyone at all, the press included. This is the particular point here.

• 1115

You stated, Mr. MacDonald, quite rightly that once the meeting is concluded what happened in the meeting is in camera, and I agree. But if a statement has been made prior which has not only been made publicly but has been put on the record and in the Minutes of this Committee, I see no reason why what is publicly published cannot be repeated verbally to the press.

Again, Mr. Cafik, you mentioned that "after the in camera committee meeting," what was said is privileged and I quite agree, but if you made a perfectly clear statement of position prior to an in camera meeting you can certainly repeat it after the in camera meeting. The in camera meeting does not close your mouth to discussion of a certain topic.

Mr. Cafik: Oh, I would agree with that totally. So far as I am concerned the point you make puts the whole matter in its proper context. However, it does raise the over-all problem of what happens in in camera meet-

ings and what our responsibilities are. I do not bring up the point, Mr. Anderson, in respect of what you have done but in respect of the over-all position—and perhaps I should have made that clear—concerning our obligations in in camera meetings. If we agree on that, let us just drop the subject.

The Vice-Chairman: Is that agreed?

Mr. Barrett: We will continue this discussion this evening, in other words.

The Vice-Chairman: Yes, we will take the point up again this evening.

Mr. Barrett: Fine.

The Vice-Chairman: Gentlemen, today the Committee will be hearing testimony on NATO by Professor Albert Legault. Professor Legault at present holds the Chair of Strategic Studies at Queen's University where he is a visiting professor. Members will find details of Professor Legault's previous experience and publications in the field of international relations in the material that has been circulated, along with his written statement entitled "NATO: A Vital and Necessary Organization".

I would like to point out that as well as other works, Professor Legault is the author of the book "Deterrence and the Atlantic Alliance" published in 1966, which is particularly germane to the Committee's work at this time.

Professor Legault will be making an opening statement in English and an introductory statement on the subject of Canada's involvement in NATO in French. For the Committee's information he is, in fact, fluent in both French and English. As is our practice, members will be able to question him on his views afterwards.

Before asking Professor Legault to make his statement, I would just like to remind you that Dr. Theo Sommer will be appearing as a witness this evening at 8.00 p.m. in this room—253-D—to talk about European security problem from Europeans' point of view. Now Professor Legault, may we commence?

Professor Albert Legault (Visiting Assistant Professor (Queen's University) Department of Political Studies, Kingston; Chair of Strategic Studies): Thank you very much, Mr. Chairman. Gentlemen, it is a pleasure and a privilege for me to testify before your distin-

guished Committee. Before accepting this invitation I had some hesitation about the subject of Canadian participation in NATO, since I can hardly see what can be said that is new or what has not been said that is significant, but since politics seems to consist of repeating over and over again the same things in different ways or with a new dressing, I will venture today for your understanding and your patience.

• 1120

In doing so I realize that there is a certain amount of masochism involved on my part, especially when it comes to the painful process of organizing before you my disorganized cults, but I am sure this will be reciprocated on your side by a certain amount of sadism, at least when the time comes for questions. This having been said I can then proceed to what the French are very proud of in any article; in any book; in any speech—presumably even in the love affair—that is to say, the introductory approach. You will hence allow me to do it in French.

[Interpretation]

Gentlemen, I would like to complete the text you have before you, in two different ways. First of all, I want to point out certain aspects of the evolution of relations between the two Great Powers, on the one hand, and between European countries, on the other hand. And then, later, we will draw the conclusions that may be implied from this with regard to NATO.

From the Cuba crisis till today, the *détente* let us admit—except for the brief interruption due to the occupation of Czechoslovakia and despite Vietnam—has been the dominant feature in relation between the two Great Powers. The main meeting ground was around the great strategic debate. This gave rise to suspension of nuclear tests in the atmosphere, the setting up of a hot line, the interdiction of the orbiting of nuclear devices and, finally, the tabling of the treaty on the non-proliferation of nuclear weapons.

And to all this we have to add the dialogue which has already started on the reduction of offensive and defensive strategic arms, i.e. the anti-missile defence system.

From a general viewpoint, the evolution of the policy of the two Great Powers is no less striking. First of all, the United States after vain efforts to develop the MLF project, the

multi-lateral force, withdrew from European problems to attach an increasing importance to the improvement of their relations with the U.S.S.R.

Then, there was the non-proliferation of nuclear arms plan which coincided, curiously enough, with the progressive engagement of the United States in Vietnam. The Russians, on the other hand, renounced little by little to the universalism of revolutionary communism as soon as the Moscow-Peking rupture took place, and attached increasing importance to Middle East questions and to the problem of European security. Two points are worth mentioning here. First of all, the asymmetry between the evolution of Soviet policy and American policy could not be more total. Little by little, Moscow has drawn in on itself to deal with its own most immediate interests, while Washington has seemed, and I insist on this, has seemed to neglect its allies to suddenly become attached to the need of safeguarding western values—at least, this is what is claimed—in Asia. Secondly, the strategic debate on the stabilization of the nuclear balance strangely resembles that that existed between the wars when the naval powers tried first of all to stabilize the strategic balance on the seas when the continental powers were thinking of the future in terms of European guarantees.

This historical parallel applies pretty well to the European situation today. France certainly was the first country to also look openly for understanding and cooperation with the Eastern countries. But Germany soon followed in the race towards a *détente*, and this made it increasingly harder for the Russians to swallow the pill. The point that we have to remember here, and I already emphasized this in the text that has been distributed to you, is that many European countries, both eastern and western, refuse to recognize the division of Europe as a definitive and final one.

• 1125

Now, the objective of the Moscow policy is obviously, first of all, to consolidate the status quo in Europe which enables it thereby to conserve its military position which it has acquired after such great effort. Secondly, to consolidate its control over the Warsaw Pact countries in such a way as to make them faithful allies. Third, to obtain the disman-

ting of NATO so as to transform Western Europe into a sub-continent which would be, if not converted to its theories, at least would come under its political influence.

The objectives of the European countries, excluding the U.S.S.R., are obviously set in the opposite direction. First of all, they want to bypass and go beyond the status quo; secondly, as far as the eastern countries are concerned, to escape from the soviet control and, as far as the western countries are concerned, to move towards unity by setting up political and economic institutions. Paradoxically, and this is important, NATO meets to a certain extent objectives number one and number two of the U.S.S.R. policy. Since military alliances tend to petrify the status quo on the one hand, and furnish arguments to the Russians to justify the control which they maintain over the Warsaw pact countries, on the other hand.

These ideas are not new, however. They have already been presented to us with much assurance, on many occasions, by a great number of French officials. It is unfortunate however, that one thus comes to consider as the cause, what is but the effects. NATO and the Warsaw Pact are just the result of Europe's division. It is only by attacking the roots of the evil that Europe can find again its lost unity. The questions which to me seem important to ask as conclusion, are as follows: first, in what measure can NATO advance the cause for the re-unification of Europe; secondly, in what measure will the Alliance have to be modified to better achieve these objectives? And here I would like to apologize for leaving the members of the Committee still looking for answers by finishing with questions rather than with answers.

[English]

Thank you very much, Mr. Chairman.

The Vice-Chairman: Mr. Brewin has the first question.

Mr. Brewin: You took me by surprise, Mr. Chairman. I was very interested in Professor Legault's paper and I have one problem. As I understand it, he says one of the reasons we should stay within the NATO Alliance is in order to participate in the process of using NATO as an instrument for the peaceful settlement of disputes, the development of the détente.

I have argued that case many times and entirely agree with it, but I am having trouble with the proposition that it is not used for that purpose and on the face of it seems to be a purely military, monolithic, static, unchanging sort of set-up which is really not used for these admirable purposes that you have set out in your paper.

I am wondering whether you could give to the Committee any reason to be more hopeful that in the future NATO will be more than a purely military alliance. I know it has been referred to in communiqués from time to time, but it is very unconvincing to some people. I wonder if you could help us on that.

Professor Legault: Yes, Mr. Brewin, you certainly went to the heart of the matter. I think it is an extremely difficult question to answer. First of all, for the reasons I mentioned I think that NATO to a certain extent plays into Russian hands in the sense that it does tend, because it is purely a military alliance, to typify the status quo. In other words, the reasons that account for the stability of the status quo are the same reasons that account for the rigidity of the two blocs and you certainly score a point there.

● 1130

However, I think the important point to remember is that you should not take the effects for the cause. I mentioned in my paper that the Russians only ask one thing, which is to say an Eastern Europe, and the Americans, to my mind, would be pretty happy to leave if only Western Europe could take into its own hands the problems of defence.

I have the impression that if you look back at the history of the cold war it has been extremely difficult for France to sell its ideas to either the Eastern European states or to the Soviet Union. I think if France does that unilaterally, you do not see any pay-off on the other side. If you ask me what are the alternatives, I think if you proceed on a bilateral basis the only thing you can do is slowly to diminish the value of NATO which, at the same time, will consolidate the conviction of the U.S.S.R. that they are right in their policy of maintaining tight control over the Eastern European states. To my mind NATO is as important to the Western world today, if you take it as an instrument of peaceful change, as it is to the Eastern European states because these states need NATO in order to have a leverage to negotiate with West.

Just imagine if NATO were dismantled. How are the Eastern European states going to manage to discuss anything with the West when they will have nothing to discuss? It is a way for the Eastern European states at the same time to try to escape from Soviet control, and I think that this is pretty well their policy. The Czechoslovakian affair is a good example of that, to my mind.

If you agree with this general statement, I think we can go deeper into the question and try to see in fact what NATO can do. I am not sure that it will be possible for NATO to achieve détente without trying to deal with various problems at regional levels. I would see the whole problem myself as a network of concentric circles where in fact West Germany would negotiate with East Germany. They have many problems in common, be it only for humanitarian reasons. I would also see a second concentric circle between Western Europe and the Eastern European states, and I would hope that Europe in fact would achieve a certain degree of political unity in the sense that it would be able to negotiate as a common front as well as in a position of strength. I would see the third circle as the United States and the Soviet Union discussing the effects which a European settlement or the effects of the original European security agreement may have on their own relations and especially as regards the maintenance of their own strategic and military equilibrium. Does this answer your question?

Mr. Brewin: Yes. I think so. I have just one other question. I do not want to summarize what you have said unfairly, but I think if I understand it you said that one of the main reasons for Canada remaining in NATO would be that it would enable us to participate in the evolution of a more peaceful system in Europe and in the world. It would strengthen our ties with the continent and so forth.

We have had from General Foulkes—I think I am putting it correctly—the suggestion that we should substantially change our military role within NATO. We should scrap the air division, and change the static brigade group in the forward lines in Germany into a contribution to the ACE mobile force available for the flanks in Europe. I take it that you do not profess to be a military expert, particularly, but are more expert in the political side of this matter. Is there any reason why

the political advantages you see available to us by participation in NATO would not be equally available if we opt for a change of roles along the general lines suggested by General Foulkes?

• 1135

Professor Legault: I must say that I completely agree with General Fouldkes' statement presented before this Committee. For the same military reasons he has explained to you, I think first of all that if you do convert your heavy brigade, or if you get rid of it when its equipment has been worn out, and make a commitment of a light brigade to the mobile armed force under the ACE command, you could use these same forces for peace-keeping. You do not duplicate your equipment, but you try to make it as versatile and flexible as possible in the sense of Canadian needs.

Again I think we should talk about Canadian needs in terms of foreign policy. The kind of participation which we make to NATO is to my mind not very important. I think this is a question which should be left to the military experts and I can only tell you that I agree with General Foulkes. I very much insist that we have a presence of Canadian forces in Europe, because if we do not have a presence there I think we will not be consulted as a full-fledged member of the alliance, as I said in my brief, but rather as an outside expert who in fact may have some ideas, but not much to say.

For example, I mentioned in the conclusions of the brief that Canada could have had quite a role to play in the argument which has divided the alliance as regards the policy of massive retaliation and the policy of flexible response. This is to my mind a purely academic debate, providing that you agree to talk the same language. If you are interested in that, I could go further later on. I think that answers your questions.

Mr. Brewin: Thank you very much.

The Vice-Chairman: A supplementary question, Mr. Hymmen.

Mr. Hymmen: I have a question in regard to Mr. Brewin's first question, in which he enquired about what NATO has done in the area of détente. Is it not true, Professor Legault, that the events of last August cer-

tainly deterred or negated the optimism which was apparent under the Harmel Plan?

Professor Legault: That is a very interesting comment. I guess we more or less disagree on the interpretation which should be granted to the Czechoslovakian events, at least according to the way you formulate your question.

I think we have to look at history again. In fact the French policy to my mind may not be so divisive, or may not have been so divisive if it had provided or produced positive results in the east. In fact it has provided the opposite results from those which were expected, and in this sense it is a failure.

On the other hand I think that this policy may have come too soon. If it is pursued in 10 or 15 years from now it may yield different results. I think that the Russian system or the Soviet empire is not yet ready to accept any decentralization of its authority because it is not secure enough. In other words, it has not yet digested what it absorbed 20 years ago. As long as this is the situation, I do not see any hopeful sign of a rapid détente in Europe.

The same thing applies, perhaps, to the grand design by President Kennedy. I hope that this will be possible in 20 years from now. But I do not see what could be achieved as far as détente is concerned either if NATO disappeared or if the Western European states cannot build up their own political and defence unity.

The Vice-Chairman: Mr. Winch, on a supplementary question.

● 1140

Mr. Winch: I have a supplementary question based on the Professor's reply to Mr. Brewin. You not only mentioned, but I think you rather emphasized the influence Canada can have by remaining inside NATO, even if there is a change of role. Would you mind expanding on that matter of influence a little more by letting the Committee have your impressions as to any change in Canada's influence, if there was a change, and if so in what direction, when France made a change in its relationship with NATO.

Professor Legault: Is this the only specific example you have?

Mr. Winch: I am just using it because I think it is the best example.

Professor Legault: As you know I never had access to the NATO Council proceedings so it is difficult for me to tell you what influence Canada had at the time. There were some press statements at the time that Canada was trying to moderate the reactions of the other NATO members. We heard it also from other people, that Canada has had a certain moderating influence, and this is excellent. As to whether we can have influences in other areas, I think that to go back to this process of détente is important, because perhaps we have tried to tackle the bull by the horn in trying to get through the central problem of Soviet power in Europe. Allow me to use a distinction which is common in strategy namely a difference between the direct and the indirect approach. I have mentioned that the problem of the unification of Europe today is probably more important than the problem of the unification of Germany which, if ever achieved, will happen only at the end of everything else.

First of all it reminds me what President Thiers said of Alsace-Lorraine in the 1880's. He said let us never talk of it but always think of it. The problem of German unification to my mind is, let us always talk of it but never think of it. The terms have been reversed.

Perhaps we have tackled the wrong problems, and we should try to have a policy of détente in the Balkans. After all Rumania, Yugoslavia, Greece, and Turkey are all Balkan countries; they have quite a lot of influence, especially after the Czechoslovakian invasion. I think that we have seen some close collaboration or rather rapprochement between Rumania and Yugoslavia. Bulgaria is still very much a difficult problem, but perhaps we should try to stabilize one area and have some withdrawal of troops in this area. Perhaps this is a policy which could be studied, a policy that could be proposed by Canada, a policy in which in fact Canada could even be used as a peacekeeping agent.

This is one example. I think there are other examples of influence. I have mentioned in my paper that in fact if you do want to have influence, first of all you need a policy. I do not know what the policy of the Canadian government is and how many task groups and how many committees are studying these problems. But I have never seen any public statement, in fact, that we were trying to

present new plans or mediate between the East and the West, and so forth. Another area where we could have a certain influence is, as I mentioned before to Mr. Brewin, in the debate on the policies of massive retaliation versus flexible response. This is to my mind very academic, because what in fact is deterring Soviet aggression—if we think in terms of Soviet aggression which is something on which everybody does not agree—is only nuclear weapons through the process of escalation.

You must also take into account the fact that declared policy is one thing in time of peace and another thing in time of crisis. The Cuban crisis to my mind is an excellent example. The United States had already formulated quite extensively its policy of flexible response. Secretary of Defence McNamara had been in office for two years, and General Maxwell Taylor before McNamara had also proposed the policy. He was at the time special military adviser to President Kennedy. Despite the policy, in his famous statement of October 22nd President Kennedy said, "Any attack coming from Cuba will be considered as an attack coming from the Soviet Union, requiring a full retaliation upon the Soviet Union".

It was a time of crisis. There was not much difference between this policy and the policy of massive retaliation of John Foster Dulles in 1954. I think that this is important to bear in mind.

• 1145

I think that if Canada had tried to explain that to the United States and perhaps to the NATO members, the split which has happened between France and the United States on this point could have been avoided. As you know, the theory of flexible response was suggested in the NATO Ministerial meeting of 1962, though you had to wait till the last meeting of December 1967 before this policy became the official declaratory policy of NATO, that is to say, until after France had withdrawn from the organization.

If you let me go further into these problems which are important to my mind, if you agree that in fact it is only nuclear weapons which deter through the process of escalation, that is to say, you need a threshold, obviously this is the second point which has raised some difficulties because the European states want-

ed the United States to define the exact level of this threshold. This threshold is a point which cannot be defined and will never be defined, because if you define it you invite the enemy to take some limited actions—anything above this threshold, below this threshold. In other words, if I said to members of this Committee, if anyone is talking to me in Greek today I will walk out of this room. So you may think that you may be allowed to talk French, Spanish and Italian and, in fact, I will not walk out of this room. So you see, when you fix a threshold you deprive yourself of the psychological effects of deterrents.

Now, this point cannot be defined to my mind and this is a point which should be left to the Germans in consultation with the Germans and this should be achieved in the Alliance as such through the process of consultation. The Germans and the British have very much insisted on the fact that you should resort to the use of nuclear weapons as soon as possible. This is an old thing, to my mind, which even goes back to 1960.

I think this is quite true, but if the Germans, in fact, prefer to wage a conventional war this is something you should decide in consultation and adjust your strategy or your declaratory policy in accordance with German needs, you see. You had at one time the Trettner Line which was an atomic demolition line between East and Western Germany and at the time, according to the public press reports that I have seen, if this atomic demolition line had been exploded it would have caused about 10 million German deaths on each side of the border.

As far as I know this policy has been completely abandoned; I do not whether for military or political reasons. Anyway, I think this is an important thing and I think this is a role where, in fact, Canada could have acted a long time ago if it had only thought of these problems.

An hon. Member: May I ask . . .

The Vice-Chairman: Mr. Winch, you seem to be getting some very involved answers.

Mr. Winch: On the second part of my question I said, could you make a brief comment? Was there in your estimation any diminution of the influence of France in NATO because of what I term a rather radical change in policy, which resulted in the American and Canadian forces having to get out of France? I am coming back the influence . . .

Professor Legault: Do you mean the influence of Canada or the diminishing influence of France?

Mr. Winch: No, of France, on account of that.

Professor Legault: There is no doubt about it; you cannot even question that. Good Lord, when France withdrew from NATO all the fourteen other members went very closely together and they started, in fact, to try to see what could be done with the Alliance and they issued the army report, which is quite a landmark in the history of NATO. It has obviously been cut down in its more progressive aspects because, as you know, France is still within the NATO Council and this report had to be approved unanimously, but I think if it had not been for France it would have come out with more progressive results and more progressive policies.

Mr. Winch: Thank you.

Mr. MacLean: First I want to congratulate Professor Legault on his statement. Perhaps I am doing it from prejudice because it coincides very closely with what I believe our policy should be. At the same time, I think there is a psychological disadvantage to the Western world at the present time and perhaps he would comment on it.

We can be painted as having no desire but to maintain the status quo—there is a tendency to do so—and the only thing that is constant in the world is change. Therefore, those who are opposed to the present policy with regard to NATO tend to take the attitude that you can never improve unless you change, which is valid, of course. However, they go from there to the conclusion that any change will be an improvement and this leaves the communist world in a psychologically advantageous state because they are openly, I think, and certainly privately, committed to world domination and therefore change.

• 1150

You have the position where the status quo is being criticized because it naturally never reaches perfection, and you have the advocates of a different world putting forward the proposition that because the Eastern bloc represents change it represents improvement.

I am especially pleased that the professor's presentation comes from his generation

because I think a lot of people as young as he cannot remember from their own experiences World War II, and the beginning of the cold war afterwards, and the situation that Europe was in before NATO was created. A lot of people of that generation are having history rewritten for them by people who I think should be more responsible.

I wonder whether you would make some further comment on what opportunities you think there are for the Western World, and NATO in particular, to take some initiatives towards resolving the confrontation that has existed since World War II.

Professor Legault: Thank you, very much. I must say, perhaps as a counter factor to what I have said before, that Canada should not try to solve the problems of the world in the sense that there are some problems that cannot be solved. You may try to make your influence felt. This is extremely important and this is a point we should bear in mind, but perhaps we should not proclaim that we are trying to solve the problems of the world. If you have small influence it will be all the more felt if you are consistent in your foreign policy; if you will have a wide range of propositions for a limited step but extending to a wide range of areas, perhaps the codification of international law, peacekeeping, some limited influence within NATO, and so forth.

You have mentioned before that the Soviet Union is in a better psychological position. I must say that I thoroughly agree with you, in the sense that the Soviet Union has not budged an iota from its position concerning a European settlement, or even questions of disarmament, since World War II. It is a fact that the West has moved further to meet Soviet points.

This is also very true if you look at the example of France. We have tried consistently to shift away from immobilism—France, the first country. Germany has also very much shifted its policy. It thought that, in fact, it could achieve all its national goals through NATO. I think they cannot be completely achieved through that but can only be supported through NATO if they want to achieve anything at all.

For example, the big powers have also shifted from the four-power negotiation schemes on the reunification of Germany to almost the acceptance of the division of Ger-

many. Germany itself was very close to accepting recognition of Eastern Germany if it had not been for the Czechoslovakian tragedy. So obviously there are some moves everywhere, and I think there are some moves in the Soviet Union, too. Actually, they have tremendous problems. The first one, to my mind, is the increased role played by the Soviet intelligentsia. It is not necessary to recall the history of Czarist Russia to remember the important role the Soviet intelligentsia has played in the emancipation of the Soviet people.

The second thing is that as invasion succeeds invasion—there was obviously Budapest, there was Prague, the second Prague—there is a tendency to have forces that built up and also forces of distrust for the loyalty of the leaders. This is, to my mind, terribly important. There has been one Budapest, a second Prague—I am not sure that the Soviets will be in a position to do a third one.

• 1155

There is also this third factor which is terribly important: this growing disaffection of Soviet citizens for their own ideology. If you read the press reports of people who know Soviet Russia very well you will find out that it is quite a business for them to organize mass demonstrations in favour of their policy. They have to kick the workers out of their own factories. It is quite a problem, and there is no doubt that the Warsaw Pact invasion or occupation of Czechoslovakia has created some deep dissensions within the Soviet Union. There is no doubt about it and this process is certainly still going on. The fact is that it has taken three weeks for the Presidium to be in a position to submit a report to the Central Committee.

Now, you could start from two points. You can say: Well look, policy for the United States is to increase or to facilitate the disintegration of the Soviet empire without provoking them. This is one policy, obviously, which is more or less the actual policy of the European powers and of NATO. On the other hand, you can say that the actual American policy should be to accept or to recognize the status quo, which is obviously going against the will of the Eastern European powers as well as the Western powers. If you accept one hypothesis or the other you have a completely different set of values and a completely different set of policies.

Looking at history and the way nationalism is going in Europe there is no doubt in my mind that the Czechoslovakian nation has simply postponed the realization of what I have called here "an awakened dreaming". I think Canada has a role to play there because I think the future of Europe is fraught with uncertainties in the Balkan regions, in the Eastern European states, and I do not think the situation of immobilism will last forever. Whatever Canada does, I think if something happens to NATO we will be amongst the first countries to send our troops back there as we did in World War I and World War II.

There is no doubt that our security is closely tied with Europe if only because of the international monetary crisis which a war could cause and its effect on the U.S. dollar and, consequently, indirectly on the Canadian economy.

Mr. MacLean: Thank you, very much.

Mr. Cafix: Professor Legault, on page 2 of your report, toward the bottom, you say:

One asks nothing but to be able to stay, and the other wants only to leave; . . .

You are talking about the involvement in Europe, and I presume you mean that Russia wants the right to stay a part of Europe through its satellite countries and that the United States, which is involved in NATO with troops and other commitments, really psychologically would like to get out of Europe but is militarily tied to it.

There are a couple of questions I would like to ask. When you speak of Russia only wanting to stay, do you feel that Russia has lost its expansionist powers in Europe? In other words, is it content to stay within its own boundaries?

Professor Legault: Do you want me to answer that now?

Mr. Cafix: Yes, please.

Professor Legault: I was under the impression that you had a whole list of questions.

Mr. Cafix: I have a number, but perhaps you could take them one at a time.

Professor Legault: I do have the definite impression that in fact Soviet expansionism was abandoned a long time ago. I am not talking about international communism but Soviet interests in Europe.

Mr. Cafik: Yes.

Professor Legault: Obviously the situation would be quite different if the Eastern European states were occupied by Communist China. Obviously if you look at the pattern today the Soviet Union alone is a European power with the problems that it involves, which explains all of the difficulties of today, and the United States is not as such. It may be in terms of economic and military strength, but in terms of political influence it is obvious that the Soviet Union alone is a European power.

• 1200

I think they have pretty well achieved the objectives pursued by Czarist Russia which are to have a military glacis on the western side, that is to say, to repulse as far as possible their western frontiers, and they are trying to have quite a lot of influence on the *de trop* in the Mediterranean area. I think the Soviet naval increase in the Mediterranean area is also very much a part of Soviet policy. In this sense I think they have achieved more or less the purposes which they have tried to achieve over a number of centuries and that they are no longer expansionist but rather conservative, which is to try to maintain as much as possible what they have acquired.

I think the successive Berlin crises should be viewed in this sense. The number one interest of the Soviet Union is to have the *status quo* recognized by everybody, including the United States. Once this is achieved, you can be sure that this climate of xenophobia, and this climate of insecurity which is existing within the Soviet system, will also disappear. I am rather skeptical that they will, in fact, reach this number one objective over the years.

Mr. Cafik: All right. Do you—

Mr. Nowlan: Mr. Chairman, may I ask a supplementary?

The Vice-Chairman: A supplementary, Mr. Nowlan?

Mr. Cafik: If I may pursue this point further, I can understand the position you have taken at the present moment, but is this position due to the fact that NATO is there and is a powerful force in Europe? If that were removed, do you feel that they might change

their policy? Is their policy, in other words, one that they cannot do anything about anyway so that they will settle back and accept what they have and hope to get away with it?

Professor Legault: No; as I said in my opening statement, we should not take the cause for the effect, and *vice versa*. In fact, the NATO and Warsaw Pacts are only a reflection of the division of Europe. Obviously, if NATO were dismantled I would be very happy, providing that you have a dismantling of the Warsaw Pact—and complete dismantling; and not a new network of bilateral agreements, or bilateral military relations between Eastern Europe and the United States and the Soviet Union, which is actually what they are doing now, bilateralism being the function of who is the most recalcitrant ally. We agree, I think, on this point.

Mr. Cafik: On the second aspect of that, you talked about the United States being willing to leave, or desiring to leave, but finding it militarily necessary to be there. Is that really true? Do you think the United States would welcome having a Europe strong enough to defend itself totally and without reservation?

Professor Legault: Certainly I think the Grand Design is an example which proves your statement—an example of the American intention. Relative to the Nixon trip to Europe today, obviously, as Kiessinger has said—and as I have read on a number of occasions—Western Europe should take into its own hands the responsibility of its own defence. This is something to which I am very much looking forward, but obviously the Western European states are not in a position today to be able to do so, and I do not think they will be within the next ten years. The Anglo-French role is likely again to have some divisive influence, and everybody is playing their own game and trying to be as cooperative as possible, or to look as being as European as the other one.

The Vice-Chairman: Professor, if I may interrupt you for just a moment, apparently there is trouble with the English interpretation. It is not coming through very well. It is just your voice we are hearing, and there is no interpretation. The French translation is coming through very well.

Professor Legault: Shall I speak a little louder?

The Vice-Chairman: Speak a little louder until the technician arrives and the situation can be corrected.

Professor Legault: I am reminded of a series of lectures which I attended last December, given by a good friend of mine who is, to my mind, one of the most perceptive writers on this question—Alistair Buchan.

• 1205

Professors have a tendency to say that if the middle and small powers do not share some of the responsibilities of maintaining international peace and security it is obvious that the great powers, seeing that, may either return to isolationism or that the world wall will be run by a condominium of powers, that is to say, the Soviet Union and the United States.

What Mr. Alistair Buchan said, in fact was that it is almost impossible for the United States to return to isolation, but that in fact, they may increasingly turn to unilateralism. That is to say, they will care about the possibility of managing their own relations with the Soviet Union, and presumably in the future with China, without paying lip-service to their allies, and without caring too much about what they do. I think this is a great danger. If you look back at the cold war, to 1948, obviously NATO, the United States and the United Nations were almost but one thing—that is, the United States.

Obviously this situation has changed, and I think we should look forward to a world in which, in fact, the middle powers take a share of the responsibilities; and perhaps we should look forward to a third stage where, in fact, you would have an intelligent, political organization, presumably through the United Nations, and some regional organization by which, in fact, you will be in a better position to co-operate, internationally speaking.

Mr. Cafik: I still want to pursue this point about whether the United States really wants Europe to have sufficient power to defend itself.

You pointed out that previously they have shown that they have, but for Europe to be in a position to defend itself in a conventional sense as against a nuclear sense is surely not giving it sufficient power to control itself. The United States surely still insists upon com-

plete and absolute control of the use of nuclear weapons, even those within NATO. I am not saying they are wrong, but does that not mean, in a sense, that they are insisting that Europe remain dependent upon them for military survival?

Mr. Nowlan: Mr. Chairman, on a point of order. I asked for a supplementary, and Mr. Cafik also said he had one. That is an entirely new question. My supplementary—and some of them are not, with respect—was directly related to the Professor's answer to his first question in relation to the expansionist or imperial tendencies of Russia.

Mr. Cafik: By all means; you have permission to go ahead.

Mr. Nowlan: Thank you, Professor, I was most interested in the question and the answer and I would like to ask you if the imperial or expansionist tendencies of Russia have changed, or if, in reality, the situation is changed in that it does not expand into Europe because the situation there is somewhat stabilized militarily, perhaps because of NATO? Otherwise, how can you rationalize the Mediterranean situation, which you touched on very lightly, or the situation in the Middle East? I would like to hear your comment on this soft area in Europe, which is not stable, yet in which there is the Russian presence which seems to be expanding.

Professor Legault: It is a very difficult question to answer and I do not believe anyone can answer it satisfactorily.

Let me say that I think we should dissociate the problems of the trend in Europe from the problems of naval strategy.

We are increasingly going into a new phase relative to naval warfare, and there has not been much strategical thinking on what in fact naval strategy will be. Nobody knows, in fact, whether a limited war at sea is possible, or if it will escalate, or degenerate into total war. Therefore, I propose to leave these problems aside.

Relative to Soviet expansion in the Middle East, it is again difficult to answer. Apparently, if you look back at history, it has progressed in direct relation to the Soviet involvement in Viet Nam, and there are some people today who say, in fact, that if the Soviet Union can help the United States to withdraw from Viet Nam perhaps the United

States will be in position to help the Soviet Union to withdraw from the Middle East.

Perhaps I am not so optimistic about the future. I think the Soviet Union is highly interested in the Middle East. I am not, however, an expert on these matters, so that is about as much as I will say.

To talk about Europe, obviously, as you said previously the question is whether expansionism has stopped because of NATO? I think they have absorbed sufficient states to give them problems enough that they will not think of absorbing other states.

● 1210

I am not thinking of NATO as an organization which will, at all costs, prevent a Soviet invasion, because I consider it very unlikely. That is why, to my mind, the Harmel Report marks a landmark in the history of the alliance, and I hope it will be pursued.

If NATO were completely dismantled, I have the impression that Europe would become a subcontinent to the Soviet system. I do not mean it will turn communist—I do not think that is possible—but it will be very sensitive to the political influence of the Soviet Union. I believe these are all the answers I can give to your question.

Mr. Nowlan: You distinguish very clearly between Europe, the Middle East and the Mediterranean.

Mr. Cafik: Perhaps you might pursue the answer to the second question I asked in relation to America's position in Europe.

Professor Legault: I had it in mind. I thought it was a very good question and also a difficult one to answer.

I do not think it is possible for Western Europe, or for Europe, to think of its own defence in terms of conventional weapons only. Obviously they will have some need for nuclear weapons. Only France and Britain have them now. I do not think that France yet has tactical nuclear atomic weapons, which makes the concept of escalation possible and makes the adoption of its strategy of flexible response possible.

The United States, if you remember, through Dean Rusk, at the time of the MLF, insisted—and a number of other people under President Johnson have insisted—that if Europe achieves its own political unity they

will be glad to turn over to Europe control of its own nuclear weapons.

I do not think this is any longer possible with the non-proliferation treaty, and this has been quite a concession granted to the Soviets at the expense of the Germans, as well as at the expense of the prospects of a future nuclear European collective enterprise. I would add that this is too bad, because had that option remained open it at least could have been a means of negotiating with the Russians.

To my mind that also explains a lot of the German frustration vis-à-vis the policy of the United States relative to the NPT, which was presented to them a few months after the MLF was abandoned. There was a completely new policy, to my mind.

If you think of the defence of Europe as a single entity they will need to have nuclear weapons, if only to give them some psychological security, and that time, I think, is still ten years ahead; and it certainly justifies the argument that as long as Europe is not constituted NATO is indispensable.

Does this answer your question?

Mr. Cafik: Yes; but to pursue it a little further, I gather you feel that Europe is confined to a second-rate military role; that it will certainly not be able to defend itself for at least a ten-year period; and that past that point they may well have their own nuclear weapons and be capable of defending themselves? Is that what you said?

Professor Legault: This, I think, is the main idea which I have tried to develop; and I think it is the main idea which the Nixon administration also has in mind for the time being.

Mr. Cafik: If that is the ultimate plan I find it extremely difficult to understand why the United States should so often be opposing the position of France in its desire, to develop its own nuclear role and to defend itself. It does not want to have to rely on North America to defend it in the event of war. Why would the United States not encourage the position that France has adopted?

Professor Legault: I think your question has already been answered in the sense that we still have the ten-year period ahead. If you start to dismantle the alliance now you will obviously give quite an advantage to the

Soviet. I simply do not think it is possible; and that is the reason French policy has had such divisive effects.

Mr. Cafik: I think we will drop that immediate question. I just want to ask one other that is related to it.

Do you think that there is any legitimate reason for the argument put forward for the existence of NATO, that it would curtail the military might of Germany? This is often used as one of the arguments in favour of NATO's existence.

• 1215

Professor Legault: I just notice Mr. Theo Sommer walking out of the room. I think that he is much better qualified to answer your question.

The only thing I can say is that obviously the terms of the equations have been reversed, as I said in my brief. The question in the 1950's was to find out what Germany could do for NATO because it was obvious to every military planner that you needed a forward defence. Now in 1969, and indeed in the decade ahead, obviously the problem is what can NATO do for Germany. I think that the German fears about being sold to the Russians or a special bilateral deal between the Russians and the Americans are quite real and in this sense I think that NATO is to them an indispensable forum where in fact they can have some consultations and negotiations with their allies, where in fact they know that somebody is still supporting their policy, that is to say their re-unification, even though they may not think it is possible in the immediate future. At least it has helped to alleviate the sentiments that Germany is the most useful but at the same time the most unwanted ally. As you know, it is very difficult to foresee in history how a nationalism will go on, and in this sense the alliance is a safety or an insurance against something which is unpredictable. You may think that this is a very conservative outlook but I think that one has to put himself into the mind of a German to understand in fact how valuable and how indispensable the alliance is to them.

Mr. Cafik: I will read a statement you made on page 5;

Thirdly, it...

I presume that is NATO,

29853—2

...can direct the aspirations of Western Germany into a broader framework, which will present her with wider political horizons and a chance to realize the most legitimate of her ambitions including, especially, that of reunification with East Germany.

There are a couple of other spots where you talk about the reunification of Europe and the reunification of Germany. I think you indicated that this was not really a possibility unless there was a change, a basic change, in Russia and in its attitude. Now I cannot really see how NATO in any way contributes to the reunification of Europe in that sense of the word. I think it contributes to its stability, to peace and to a lot of other things. Perhaps you would comment on that for a moment.

Professor Legault: I am afraid I will have to repeat what I have already said before. I think that you can only negotiate from a position of strength. If you have read the press reports you have seen in the Nixon visits to Germany that obviously Germany wants the United States to back them on their negotiations with Germany or with the Eastern European states. They are very much looking forward to normalizing, if I could use that word, their relations with Eastern Europe. Just looking at their past policy, they have been pretty successful. Obviously, that stopped with the Czechoslovakian invasion. But I think, as I have said before, that this is only temporary and is likely to come back to the surface again. We must not forget that if forty years ago Bolsheviks had to choose between universal socialism or socialism in one country, they either have to choose today between universal socialism or socialism in one empire and strike a proper balance between the two. I think that if they do not do that they may otherwise be completely overcome either by the left, which is to say Chinese militancy, or by the right, which is trying to develop a more humane socialism of the Togliatti type—and, again, I think that Czechoslovakia is a useful example.

• 1220

I think that we should not think only in terms of force. There is obviously some very powerful political forces which are now at work in Europe and which are working against the civilization of the status quo. I

think that this is likely to go on. You can only do that if you are obviously in a position of strength, otherwise I think it may simply become a subcontinent to the Soviet Union. I think that this is where in fact NATO is still very necessary, if only to reassure the Germans that they will not be left alone.

Mr. Cafik: Do you not feel that the biggest problem to reunification and to perhaps lessening military tensions in Europe is the genuine fear that Russia has of the liberalizing tendencies of its own satellite, such as in Czechoslovakia. I read into that a genuine fear that Russia has, and if one were to try to get a meeting of minds on the two sides I do not think Russia could afford to do it because their own people would get out of the cage, as it were, if they ever let the barriers down.

Professor Legault: Let us take Cuba, for example. If Cuba ever normalized its relations with the United States that does not necessarily mean that they will become an ally of the United States. But at least they can normalize their relation and they can have a certain evolution of their relations. I think that this is what the Eastern European states are looking for. I do not think that if the Soviet Union accepts an independent Romanian foreign policy or an independent Polish or Czechoslovakian foreign policy, it will necessarily mean that these people or these countries will turn democratic and will ally with the West. If this is so, well, this is simply suicide for the West because I think this is completely unacceptable to the Soviet Union. As I have said before, these changes or these potentialities are there and are likely to come to the surface again. But it would rather be the kind of a normalization between the Eastern European states and the Soviet Union, if you allow me the analogy of Cuba and the United States, if there is ever a certain kind of normalization between these two countries.

Mr. Cafik: Thank you very much, Professor Legault.

Mr. Allmand: Professor Legault, your paper seems to be based on the supposition that Europe is still the principal and perhaps the only meaningful centre of world politics. Some of our witnesses, especially Professor Michael Brecher, have stated that this is not so and have suggested that any policy that is based on that supposition is a policy that

looks back and not forward. And whereas Professor Brecher and others have said that Europe is important, the real danger areas to world stability and to world peace are in the third world—in South America, in Africa and in Asia. These witnesses to our Committee have suggested that Canada can play a much more important role in building bridges to the third world, that what we have to offer can be much more meaningful, that the type of balance of power that you talk about in Europe will be there whether we are with it or not, that we will have the benefits but that we will not be really contributing to the real stability of the world and to political peace and so forth that we could. Are you familiar with Professor Brecher's statement?

Professor Legault: Yes, and to my mind, it is one of the most persuasive which has been presented before this Committee.

I do not see why we have to see politics in terms of black and white. I do not see why if you can have one friend you cannot have a second one, and obviously I do not see why Canada cannot stay in NATO and at the same time try to adopt a progressive policy toward the third world. You cannot read a book today without seeing a comment about the north-south division, the poor country and the industrialized country, and that in fact because of China the industrialized countries may become an ally against the third world.

• 1225

Obviously you cannot see international security in terms of only one area. I think that this situation also applies to Europe. The European powers have had a tendency in the past to be disinterested in what was going on in the United Nations. I think that this is too bad because the more co-operation you have in the U.N. the more co-operation you have abroad, the more co-operation you have with the third world, and the more difficult it becomes presumably for any other system to have a different policy. In other words, you may say that the United Nations international organizations and corporations abroad are all interdependent. I have the feeling myself, though nobody can prove it, that international peace and security is really interdependent and that you cannot have detente in one area without having it in the other. This is a statement which has been made by a lot of French

people in the French press. If you had not had the Dominican Republic, Viet Nam and maybe the Middle East maybe you would not have had the Czechoslovakian tragedy. Well, you see, nobody knows, you cannot prove it, but I think that this is interdependent. I am very much looking forward myself, if for only this reason, to the unity of Europe to the point where in fact they could play a role as far as international peace and security is concerned. I do not see why Canada should be limited in its foreign policy by 1 per cent maybe of its gross national product which could be diverted to the third world and I do not see why we could not spend at the same time so much money within NATO. I do not think it is contradictory, I do not think it is a choice between black and white, I think it is rather a political philosophy of what your foreign relations should be; and if in fact you do believe in international peace and security and the restoration of a durable and peaceful world or world order, I do not see why you should disengage from your military alliances which are trying to achieve through other means the same purposes.

Mr. Allmand: I agree that it is not a black and white issue. But it appears to me and to some of our witnesses that we are now very much committed to one thing, let us say to Europe, and Canada and many other countries are very little committed and underestimate the potential problems resulting from the third world. We are a small country with limited resources. You seem to suggest that we could continue our military commitments in Europe and still do what we should do with respect to the third world. I would like to think that was so perhaps but I feel that with our budget and so forth we cannot do that. We will have to make priorities and perhaps, because of the detente in Europe, we should channel our energies more towards the third world.

Are you suggesting that we can carry our present military commitments in NATO and still do what we have to do with respect to the third world?

Professor Legault: This is what I would do myself if I were Prime Minister. You may disagree with me on that.

Mr. Allmand: Or a taxpayer.

Professor Legault: Even if I were a taxpayer.

Mr. Allmand: Very good.

29853-2½

Professor Legault: It is a question of either believing in political co-operation or not. Obviously everybody has been turning away from this objective which, to my mind, was the objective of the United Nations. So much has evolved that everybody begins to be sceptical about it, about the results, about the pay-offs, about their political influence and so forth, and in so doing they forget that this goes back to the league of nations, this goes back to political co-operation with the institution of the British commonwealth, this goes back to the political mandate of President Wilson. You believe in a cause or you do not believe. You may say that peacekeeping, for example, is something which is secondary, which is useful but not necessary. Well in time of crisis what is useful very often becomes necessary. The same thing applies to your relationship with your own wife. What is useful in time of conflict may become very much a necessity. If you stop believing one day, because everything is moving so slowly and because great powers have such an influence, that you do have influence and that you can achieve anything at all, then you have had it, I am sure.

• 1230

Mr. Allmand: Excuse me, you seem to be confusing my remarks with respect to NATO as being directed towards the United Nations. I have not even questioned the United Nations; I perhaps question NATO.

Professor Legault: I am sorry, I think I am sending back your own questions in the sense that presumably NATO is trying to achieve international peace and security but through different means, and I do not think it is contradictory in that sense.

Mr. Allmand: Thank you.

Mr. Anderson: Mr. Legault, you mention here there is a possibility of problems in eastern Europe spilling over into Western Europe. If I keep turning the pages I will eventually find it.

Professor Legault: I remember writing it, anyway.

Mr. Anderson: It states:

Events similar to those of the summer of 1968 could be repeated in Poland, in Hungary, or in Roumania, and could well spill over into western Europe.

This is a commonly-held view but I find it difficult to justify. Is it because the West Germans are so preoccupied with East Germany with respect to unification that they might well take advantage of trouble in Eastern Europe? I cannot see this happening with a relatively stable group of West European countries which have political systems which are now, I would say, stable. I do not know what your views are, and I am not necessarily thinking of Southern Europe but of Central Europe. I cannot see how unrest in Poland could spill across into West Germany. I just cannot see it. Are you suggesting that a certain dissident group might be pushed across the border? Even then, to my mind, this would not create political instability. Would you elaborate on this, sir?

Professor Legault: I must say that this is a strong argument and it is also very difficult to prove. When this kind of argument is made you can only proceed by intuition. I think the European situation is much more unstable than people are inclined to think precisely because the political *status quo* is so stable and precisely because everybody believes in deterrents and the possibility of the Big Two to impose a solution on the other countries. I think perhaps if you had been living in Europe for ten years, and especially if you had been living in Europe at the time of the Czechoslovakian tragedy or at the time of French revolution last May, you would have quite a different feeling than sitting here in the Committee.

I remember at the time talking to a French personality, a general, coming back from Russia in the aftermath of the French revolution in France and the first thing he said was "Look, I think what has happened in France could happen tomorrow in the Soviet system". I think there is quite an element of truth in that, especially if you are aware of the difficulties there are within the Soviet system. Obviously they are better able to control the vast communications process which can make a small event degenerate into the kind of hysterical, psychological, collective reaction that has happened in France. They are obviously in a better position to prevent that. However, if you remember—according to a Chinese press statement which was made in the summer—one of the strongest men within the central committee who will in fact push the central committee to adopt a stronger line

toward Eastern European states is Mr. Chelst, who is the First Secretary of the Ukrainian Republic. According to some Chinese statesman they had a revolution there which was stopped through bloodshed and tanks in Krakow. Whether this is true or not we just do not know, but I am sure if you talk to any Soviet political expert he will tell you that in fact the situation is very dangerous within...

Mr. Anderson: May I follow that up by saying that while I quite agree there is a possibility of instability in Eastern Europe, I do not see how this can somehow be exported across what you might call the East-West line down the centre of Europe. I just cannot see it. I can certainly understand that on the one side there might be instability because of internal backers, such as in France as you have mentioned, or indeed there might be instability on the other, but to me the two systems appear to be sufficiently different and the causes of instability in each area are sufficiently different that I cannot see the causal connection which you suggest in this particular paragraph.

Professor Legault: Perhaps it is a question of personal taste. The only thing I can say is that there is a law of physics to the effect that The violence of the explosion is more or less in direct proportion to the degree of compression. This is about the only thing I can say. Perhaps I see the situation differently. I am not trying to sell you my ideas. This is just intuition on my part and it is about the only thing I can say. You see, I did not justify NATO in this respect at all, I just said it is an insurance policy, adding that the people around this room more or less agree that today the first function of NATO is not to prevent a Soviet roll-off to the Atlantic, because that would be simply inconceivable.

• 1235

Mr. Anderson: I can certainly see with respect to Germany, for instance, that pre-occupation with the other Germany, be it East or West, could lead to such developments. I can see Western Germany perhaps trying to profit by a problem in East Germany, and I can see where the reverse statement could also be true.

Professor Legault: I must say that even the East Germans are not very well liked within the Eastern European states.

Mr. Anderson: Which, of course, would make it more difficult. No comment with respect to Western Europe.

You say in point 4:

This Action:

(4) Allows us to have a voice in the decisions of the Alliance, if not to direct them, particularly regarding the establishment of policies for the use of atomic weapons...

A number of witnesses have come before this Committee and have argued that because our voice within NATO is so small and because we have no real power whatsoever that we should turn away from this obviously Uncle Tom organization, where the Americans pull all the strings, and try to develop friendships elsewhere. Not a single witness to my mind—and this is my personal opinion—has convinced us that we can win friends elsewhere. They have simply mentioned this in rather general and vague terms. However, could you comment on the other aspect of that; namely, how much of a role do we have in NATO and how much voice do we have in deciding where atomic weapons are placed? Could you give some indication of how much the Europeans value our position there. Does it help them vis-à-vis the Americans?

Professor Legault: If you only think in terms of military contribution, I think our contribution is about 10 per cent of the nuclear strike role. I do not think this should be looked at in isolation. After all, this inter-allied force was created in March of 1963. I think it was in March, but in any event it was at the time of the NATO ministerial meeting in Ottawa in 1963. There were ten powers associated with that. France has now withdrawn so obviously they no longer have nuclear weapons under the dual system.

I think you should also bear in mind that this was at the very critical time when, in fact, questions of nuclear sharing existed within the alliance, and this was a means of satisfying the German ambitions and German needs for nuclear weapons only because they wanted to have a say in the nuclear strategy of the West or, at least, of the United States. Once the MLF was abandoned there was another solution, which was the McNamara committee which McNamara announced on May 31, 1965, and which drew up the actual nuclear planning committee. I think this is

vital to Germany in the sense that they should know, in fact, where these weapons will be delivered, to which target they are assigned, and so forth. In the mid-1950s nobody knew, in fact, where these weapons would be targeted and nobody knew how to use these weapons. This is quite a change, and I think it is quite a change as far as the German national security is concerned. If they want to adopt a strategy of conventional warfare because they think it is more in their interest, then why not work it out through the alliance, and this is an area where, in fact, Canada could play a role. If you asked me what influence Canada has because of its nuclear strike role, I think it is completely different and presumably you should not look at it in terms of having a nuclear strike role but in terms of being a full-fledged member of the alliance, which in fact has espoused the goals and purposes of the alliance.

Mr. Anderson: This is what I was getting at. I did not mean the particular strike program but the over-all one.

Professor Legault: I think everybody would more or less agree that in fact it is not so much your contribution which is vital as the fact that you have a policy if you want to have some influence.

Mr. Anderson: If I have time, Mr. Chairman, may I ask a final question? I completely agree with you in your interpretation of the influence in NATO. Do you feel that our present role in NORAD will give us some influence on these ABM systems which the Americans are setting up? When I say this I am not suggesting that Canada take part in ABM manufacture, or anything of that nature, I am merely suggesting that through our fairly close relations with the Americans do you feel that we can have some influence in siting these batteries so that in the event of war and the use of these particular weapons fallout would not drop on Canadian centres of population? Do you feel we would have some influence on siting...

• 1240

Professor Legault: I do not think we would have any influence if we do not participate, and I do not think we should participate in an ABM system. This goes back to my previous comment, that if the great powers, and especially the United States, decide to spend

\$50 billion on civil defence and \$50 billion on ABM, that in fact they may turn out to be so schizophrenic about their own security and they may feel so secure—which to my mind is a marginal concept—that in fact they will not care about anyone else except themselves, and I think this is something which Canada should try to avoid. The influence we should perhaps presumably have is to dissuade the Americans from going into this business. I know that Dean Rusk has accepted the construction of a thin system presumably to have some say, some influence and some object of negotiations with the Russians. If this is the only purpose or not I do not know, but I do know that there are a lot of pressures within the Pentagon to move from a thin system to a thick system. I would feel very sorry if this were done because I think it is a tremendous and a scandalous waste of money. No matter what you do, it is less expensive for the enemy to build up its offensive forces and they will always get through.

Mr. Anderson: I could not agree with you more but my point is, though, strictly on the question of siting these particular weapons, do you think we can have any influence with the Americans?

Professor Legault: I cannot answer your question simply because I have no access to what the deployment of these ABM systems will be. If I knew perhaps I could tell you but I just do not know.

Mr. Anderson: Thank you very much.

The Vice-Chairman: Mr. Marceau.

[Interpretation]

Mr. Marceau: Mr. Chairman, first of all, of all the witnesses who have appeared before this Committee, Professor Legault is the first to have submitted a bilingual report, and I want to congratulate him for it. I hope that this excellent procedure will be followed up by other future witnesses, because this enables us to compare right away the two statements of the witnesses, and I think this is a very precious contribution to the Committee.

On page 3 of your written comments, Mr. Legault, you say—that is 3 of the French text, no doubt—at the beginning of the last paragraph, you say:

“Military security and a policy of *détente* are complementary”.

Maybe we could have more details on this because, the way I see it, military security makes it perhaps easier to maintain peace, but if we have warlike ideas or ideas of rearming, I do not see how this can contribute towards a *détente*.

Professor Legault: Well, it is quite clear, sir, that I am not suggesting a massive increase of military budgets within NATO. I think that the security that the Western countries have within NATO is sufficient, and I do not just want to repeat what I have already said previously, that it is a question of transforming the Alliance into an instrument for the peaceful settling of misunderstandings. I think we must realize that it is precisely this climate of security that has made this constant dialogue possible between the Russians and the Americans. In other words, if you yourself are in a psychological climate of total insecurity, you are neither in a state to negotiate nor to impose your viewpoint on the other party.

And I can only repeat what I have already tried to explain earlier, namely that, in that respect, if you have neither a united Europe nor NATO, I cannot see what results will be achieved concerning precisely this relaxation of the bonds, this *détente* and relaxation of the control maintained by the Soviet Union over its allies.

• 1245

Mr. Marceau: In one of your comments, you seem to give the impression that NATO, in its present state, is possibly not adequate and that it should be altered or, perhaps, reoriented. Could you give me some details in that respect?

Professor Legault: I think the only views I wanted to present were given in the opening of my statement, i.e. that I think of an evolution in terms of committees and study groups that would be constituted in terms of regional problems, in other words, if you wish, in terms of concentric circles, of study groups which could discuss with their opposite number in the other bloc. This is the best way to face the problem, in my opinion. And, I think that Canada could make some suggestions or proposals along this line, either with regard to European security, or, perhaps, improvement of relations between the countries of the Eastern and Western blocs.

Mr. Marceau: Do you think that, eventually, that NATO and the Warsaw Pact are going to disappear or do you think they are going to play a greater role in the future?

Professor Legault: Well, if we come to a point where there is in fact this North-South division between industrialized countries and poor countries, the countries of the Third World, it seems quite obvious to me that these alliances will have to disappear because they will not be necessary. Alliances are solely the result of a fear, of a climate of insecurity. If you manage to establish a climate of cooperation and understanding, I do not see why you have to defend yourself against a fear that does not exist.

Mr. Marceau: But your personally, do you believe that...

Professor Legault: Yes, I do. I think that the goal should be to reach that objective, because this entails expenditures that could be used elsewhere. And, in this case I am giving an argument that was presented to me previously along these lines.

Mr. Marceau: Among the theories you mentioned on page 4 of your report, you did not indicate any possibility for Canada to reduce its contribution or perhaps even to suspend it, let's say, for a period of time. Do you think that this might be possible?

Professor Legault: I do not think that in a time of crisis, particularly, if you withdraw your troops to Canada, that you will be in a position to transfer them to Europe. In fact, in that case, obviously it plays a role with regard to dissuasion, although rather with regard to your psychological will to defend what is in danger.

But, I think that, for economic reasons, that would cost us about the same amount. If you ask me whether we can evolve from this heavy brigade to light brigades or battalions that are part of the mobile line forces within NATO, I fully agree with this. But, as I said at the outset, I think we will have all the more influence providing our contribution, even if only symbolic, exists.

There is something I do not understand. Canada was the first country that pushed probably the United States and even Europe to sign this treaty, which was approved in the House of Commons by 185 to 0, which is quite

extraordinary. In view of this, I do not see why Canada should be the first country to withdraw its troops from Europe.

And tonight, if you discuss this question with Mr. Theo Sommer, he will use more or less the same argument. In other words, if this must really take place, let it be the Belgians or the Dutch or the Greeks who withdraw troops and not Canada.

• 1250

Mr. Marceau: But do you not think that the situation that existed at the time that decision was taken is not different from the present one? In view of the problems of the Third World, do you not think that Canada should gradually orient itself towards providing increased assistance to the Third World rather than towards a contribution to Europe, which might be useful, but which, I think, would be far more useful and more effective if it were directed towards the Third World, which eventually will need this help?

Professor Legault: I think I have already answered that question. I do not see why you should not have a second friend, even if it will cost you a little bit dearer. This is also the case with one's social relations, the more friends you have—if the aim of your external policy is to have no influence, fine, you must say so. But then, let's close shop. I do not think this is contradictory. And I do not believe that the citizens are not able to support further taxes if you have a policy to justify this.

You will not sell a policy to citizens if it is so complicated and obscure; no one would support it. Naturally, in this case, it is also a matter of political imagination and domestic support, with regard to the federal government.

Mr. Marceau: Thank you, Mr. Legault, and again I want to congratulate you for your written comments and your testimony before this Committee.

Mr. Legault: It is I who thank you. May I point out that there is a translation error here in the English text.

[English]

On page 8 of the English text the translation is exactly the opposite of what I have said. In the first paragraph beginning with "In my opinion", the last line of the first paragraph,

...since in the final analysis, it is unlikely that the Canadian Government will be able to choose more than one.

what I said in French is that it is unlikely that the Canadian Government will choose only one of them. In other words, I was talking about the six alternatives on page 6, where we are already participating in (3), (4), (5), (6). That is on page 8 of the English version, yes.

The Vice-Chairman: Yes, it is about the seventh or eighth line down from the top.

Mr. Stewart having left us, that concludes the questioning unless there is someone else. All right, there being no one else, would the Committee agree to print Professor Legault's advance presentation as an appendix to this day's Minutes of Proceedings and Evidence?

Some hon. Members: Agreed.

The Chairman: Agreed as amended. Professor, on behalf of all the members of the

Committee I should like to thank you very much for your thoughtful presentation and the manner in which you have so patiently and thoroughly answered our questions. I regret that we are not as familiar with this room as we are with the room in which we usually meet in the West Block. It has caused a little confusion this morning, but I am sure you will forgive us for that. Thank you very much.

Professor Legault: Mr. Chairman, it certainly has been a pleasure for me and I thank you very much.

The Vice-Chairman: The meeting this evening will be in this room at 8:00 p.m. There is no brief. The meeting is adjourned.

APPENDIX NN

Text of a Presentation by

Mr. Albert Legault

before the

External Affairs and National Defence
Committee

February 27th, 1969

NATO: A VITAL AND NECESSARY
ORGANIZATION

In 1969, the application of the adjectives "vital" and "necessary" to an organization such as NATO may well seem questionable or, at the very least, presumptuous. One may well ask whether this "child of the Cold War", as Mr. André Fontaine was recently pleased to refer to it, has not outlived the objectives it was designed to meet, that is, the containment of Soviet expansion in Europe. What is now to be expected of this cumbersome military apparatus, when policy has reached a stage of *détente*, and the theme of our discussions is one of co-operation? What political justification now exists for Canadian participation in NATO?

Admittedly, we are living in a time of *détente*; a study of international political developments over the last few years is sufficient to convince us of this fact. *Détente*, however, is not an end in itself; it is merely an instrument in the service of a broader policy. To repeat a phrase that is destined to become a byword, we must progress "from *détente* to *entente*, (or understanding), and from *entente* to co-operation". The memory of the tragic events of last August 21st are more than enough to make us realize that this expression does not have the same meaning for all.

To understand the reasons for NATO's existence, we must consider the conditions from which it sprang. In 1949, certainly, there was a need to stem the tide of Soviet expansion before it reached the shores of the Atlantic. But there was more to it than that; NATO was a shield against outside intervention, and behind it, Europe was able to rebuild, both economically and politically. All this, it seems to me, constitutes a brief summary of the Organization's history, from its birth to the time of President Kennedy's Grand Design.

It also seems to me, however, that none of this goes to the heart of the matter, which, in

reality, is the confrontation between two opposing and, at that time, unyielding ideologies; it is from this that the division of Europe was born. The two blocs that now confront each other there were brought about by the respective military might of two superpowers, stretching, in one case, from Washington to Berlin, by way of London and Paris, and in the other, from Moscow to Pankov through Warsaw, Prague, Budapest, Sofia and Bucharest. One asks nothing but to be able to stay, and the other wants only to leave; and in that statement lies the whole tragedy of today's Europe.

No specialized knowledge of the relations between the countries of the socialist bloc is necessary to a realization that all is not well, that they are in the grip of a critical struggle for control. Events similar to those of the summer of 1968 could be repeated in Poland, in Hungary, or in Roumania, and could well spill over into western Europe. Only a strong and united NATO would be in a position to cope with problems of such a magnitude. In this sense, the Organization constitutes an excellent insurance policy against a fire that could spread from the socialist bloc to engulf all Europe. NATO, then, is irreplaceable, unless Europe takes responsibility for her defence into her own hands. Until that happens, the Alliance will continue to be indispensable.

It would also be a dangerous illusion to think that the reunification of Europe could be achieved unless the Soviet Union's policy evolved in the direction of a greater respect for human diversity, and the abandonment of the repression imposed on her own people and on others. In other words, *the division in Europe will not disappear until the factors that brought it about themselves disappear*. This is the crucial point that we should never

have ceased to recall. Dismantling NATO would only strengthen the Soviet Union's faith in the policy of repression to which she subjects her allies, and would be more or less tantamount to leaving the socialist countries to their fate. Furthermore, it would be—if not an invitation to the Soviet Union to attack—at least a paving of the way to a whole series of political manoeuvres and acts of intimidation, whose effects would not be long in making themselves felt.

The truth is that the Poles, the Hungarians and the Roumanians, to name only a few, are still looking Westward. The French and the Germans, for their part, continue to look to the East. The events in Czechoslovakia have not shattered the hope for a new Europe; they have merely postponed the realization of what is, for the moment, no more than an awakening dream. The reunification of Europe, which is, after all, largely obscured by the problem of German reunification, cannot be left to isolated or—worse—to accidental attempts at a solution. It is only within the framework of NATO that the possibility exists of co-ordinating the efforts of the various countries, of establishing the objectives of a progressive and dynamic policy and of setting up committees and task-forces (who would, let us hope, find opposite numbers within the Warsaw Pact) to appraise the means at NATO's disposal to achieve the ends desired. The Harmel Report represents a first step in this direction, but it will have to be followed by many others if we are to fulfil the promise of what is still no more than a tentative outline.

The authors of this Report were justified, too, in their conclusion that: "Military security and a policy of *détente* are not contradictory, but complementary". Trust and security have always been two sides of the same medal, and history shows this. I find it difficult to question the worth of this principle, particularly at a time when the two Great Powers have long since made it the touchstone of relations between them. Thus, it would be illusory, at the very least, to believe in the possibility of creating an atmosphere of political stability between the two European blocs, conducive to understanding and co-operation, without a balance of power between their respective positions.

NATO, finally, is necessary to Germany's peace of mind, since she is presently unwill-

ing, and unable, to have an independent defence policy outside the Alliance. Soon after the establishment of the Organization, people were quick to wonder what Germany could do for NATO. In 1969, the factors in the equation are reversed: what can NATO do for Germany? In essence, its function seems to me three-fold. Firstly, it must ensure the security of the Federal Republic; this has always been, and still is, the primary task of the Alliance. Secondly, it must provide a defensive screen, in the shelter of which the countries of Europe can become reconciled and reunited with one another. It should be borne in mind that this was the policy of Schumann, of Gasperi and of Konrad Adenauer. Thirdly, it can direct the aspirations of Western Germany into a broader framework, which will present her with wider political horizons and a chance to realize the most legitimate of her ambitions including, especially, that of reunification with East Germany.

Let us now turn to the question of Canadian participation in the Alliance. It seems to me that there are six possibilities to be considered. Canada could:

- 1) withdraw from the Alliance altogether;
- 2) follow the example set by France, and withdraw from the strictly military organization, while remaining a member of the Alliance;
- 3) participate in the Alliance solely on the basis of a contribution to the defence of the North American continent;
- 4) participate in the Alliance by holding armed forces in reserve in Canada;
- 5) make an exclusively naval contribution;
- 6) participate directly by placing troops under the command of SACEUR (Supreme Allied Commander, Europe).

The first possibility, however attractive it may be, is hardly realistic, in my opinion. Any renunciation of the Treaty could only be interpreted as a condemnation of the aims and objectives of the Alliance. I believe I have laid sufficient stress on the need for the Alliance for repetition to be unnecessary. Outright withdrawal on the part of one of its members would not fail to encourage divisive trends within the Alliance. The best way of weakening NATO, obviously, is to sow the

seeds of doubt in men's minds, leaving time to do its work. This is a tactic the Russians have employed with remarkable skill in the past, but without success so far. It would be a pity if Canada were to be the first country taken in by it.

Furthermore, it is essential to realize that an alliance is not an addition or subtraction of national contributions. It is, and must be, an intermingling of national desires seeking a common goal. The dynamism and determination that give it life will constitute its strength or its weakness. If a man is known by his deeds, a country is also judged by the responsibilities it assumes. From this point of view, it seems to me, the second possibility does not stand up to serious examination either. Canada's withdrawal from the military aspects of the Organization would deny all credibility to her political involvement, and her influence within its councils would be reduced in proportion. It is only by making common cause with the Alliance that Canada will be able to carry any weight in its decisions, to say nothing of guiding them. In this respect, it is doubtful whether Belgium could have had such a strong influence had she not participated in the military organization of NATO. The Harmel Report, in any case, attests to the importance that a member country can exercise within an alliance; but this does not alter the fact that a country must have a policy!

As for the third, fourth, fifth and sixth possibilities, let us at once point out that Canada is already involved in a careful way in them. We participate in the defence of the North American continent through NORAD and SACLANT; we keep two infantry brigades in reserve in Canada, to reinforce our brigade stationed in Europe, if necessary; we make a naval contribution to SACLANT, as I have already stated. Finally, we maintain a mobile armoured brigade in Germany. Although our defence policy review embraces NORAD and SACLANT, it is definitely the question of maintaining our forces in Europe that appears to cause the greatest confusion in people's minds.

In my opinion, the best way of illustrating the advantages we derive from the stationing of our troops in Europe is to adopt an opposite approach, and examine, the alternatives, one by one. I must stress that this is a purely theoretical exercise, since in the final analysis, it is unlikely that the Canadian Government will choose only one of them.

Let us note, at the outset, that the third possibility has already been seriously considered, particularly at the time when NORAD was established. The reasoning behind it is very simple: since the geographic area covered by the Treaty Stretches from Europe to America *via* Canada, is it not true that this country is already fulfilling its obligations by taking part in the defence of North America? Would it not be advantageous to withdraw our troops from Europe and attend to our most immediate interests? In other words, if we may pursue the analysis further, to what extent do countries such as Iceland, or, for that matter, West Germany, contribute to the defence of Canada? So stated, the argument obviously has some weight.

However, it is possible to counter these legitimate arguments with political reasons that are no less convincing. In reality, Canada's contribution to NATO is not born of a need for security but a profession of faith: a desire to assume an increasing share of international responsibilities. Secondly, as the objective of European policy today is to elude the growing influence of the two major powers, the number one objective of Canadian policy has always been and remains that of escaping the American political orbit. Canada's European contribution to NATO, in this sense, constitutes an independent political action, which has sprung from an independent national will. It tends to confirm the awareness of a national unity through the prism of international accomplishments, a fact which is far from being negligible at a time when Canada is seeking her own identity.

The same arguments appear to me to be just as valid with regard to the fourth alternative. Apart from the fact that it is difficult to conceive of substantial savings which might result from recalling our troops assigned to NATO (as they will have to return from time to time to participate in Allied military exercises) to change them into reserve troops, it is practically impossible to determine the immediate advantages which Canada might derive. In any case, it would be ironical, to say the least, if the amounts thus saved were to be used for the defence of the North American continent.

The fifth option has this in common with the fourth that the ships assigned to SACLANT could be thus kept in reserve with a view to a possible participation in the mari-

time command recently established in Naples (MARAIRED). The advantages of such a formula are obvious. Of all the member countries of NATO, is not Canada with the United States a maritime nation, at least by geographic location? Would it not be in her interest to provide a purely naval contribution to ensure the protection of her territorial waters, even though, in cases of emergency and at the request of NATO naval authorities, she may transfer some of her ships to the Mediterranean?

History and strategic considerations, I feel, provide the answers to these arguments. In the first place, let us immediately point out that Canada is not a naval power. For obscure reasons, the development of a Canadian merchant fleet has never constituted a primary objective in the policy of the federal government. It would be difficult, therefore, to justify the development of a powerful national navy under the pretext that we must guarantee the safety of our sea lanes when these are in no way vital to us.

If it is a question, on the other hand, of protecting ourselves against the threat of missile-launching submarines, this is an area in which Canada would quickly overreach herself. We have neither the technical nor financial means of setting up such a program. For some ten years, we have been witnessing a progressive militarization of the seas and oceans which are gradually becoming veritable mouse-traps for small and middle powers. It is difficult to find a single reason, be it military in nature, which can justify the launching of a vast antisubmarine warfare program. At the very most, Canada must ensure the protection of her territorial waters. This is tantamount to saying that we must possess adequate means of detection and identification, first to make sure that our territorial waters are not violated without impunity, and, secondly, to be in a position, if need be, to protest through a diplomatic note.

Let us note, finally, that our participation in SACLANT has practically nothing to do with NATO. In fact, in maintaining powerful means of antisubmarine warfare, we are either helping the United States weaken the invulnerability of the strategic reprisal power of the Soviets—which, I feel, is hardly in keeping with the requirements of a sound strategy—or else we are helping to strengthen

the invulnerability of the American reprisal strength—which seems to me to be no more in keeping with Canadian interests. As regards NORAD in which we must participate because, in the final analysis, either we are allied or we are not, it is quite obvious that this commitment concerns only Canadian-American interests and not the Alliance as such, unless it be very indirectly.

Let us take this opportunity to digress a moment. It is probable that, in the years to come, Canada will be exposed to increasing pressures from her neighbour to the south regarding a more active participation in the field of antisubmarine warfare. We shall be in a better position to resist such pressures if we have diversified the nature of our military commitments and if we can reply to Washington that, after all, we are doing more than our share, either in peace-keeping or in NATO, by maintaining troops stationed in Europe.

This leads us to our sixth and final option: maintaining our troops in Europe. One of the major roles of our armies has always been to support and uphold our foreign policy. This situation will not likely change in the future as Canada has no secret or avowed enemy. It goes without saying, therefore, that our armed forces constitute, *ipso facto*, the primary political tool by which we may influence our allies and have a voice in what should be the professed purpose of our foreign policy—the establishment of a lasting and peaceful international order.

Europe, I feel, is the prime concern here. Never has the balance of military forces been so successful as over these past years. And yet, no-one can doubt the importance of the forces of change which are present in Europe today. Some of these seek to alter if not upset the *status quo*, others to maintain or stabilize it. It is possible that within a short period of time they will counterbalance one another. But it would be presumptuous to believe that it will always be like this. Too many psychological, historic, economic and social reasons militate against the division of Europe to permit belief in its perpetuation.

NATO is no longer what it was twenty years ago. It still is a forum and effective centre for exchanges of information and viewpoints; thus, each of the Allies may form its policy in the light of a thorough knowledge of the problems and objectives of all the

others (Harmel Report, subsection 7). But it should be and is already in the process of becoming an effective instrument for the peaceful settlement of disputes, if ever the member countries of the Warsaw Pact should wish to attempt dialogue. Furthermore, if we wish to be consulted, not merely as an expert, but as a full-fledged member of the Alliance, principally concerning the institution of a European defence system or the balanced and progressive reduction of the armed forces on both sides of the two Europes, it is quite obvious that we shall attain this objective only if we maintain troops in Europe and if we willingly assume our responsibilities in ensuring the military stability of the European area of the Alliance.

International politics has always been, for better or for worse, the product of opposite national wills fostered by men of different beliefs or convictions. It is when the one side ceases to believe in a cause that the other side triumphs. It would be a pity for Canada, on her part, to suddenly cease believing in the law of international co-operation and mutual aid.

Allow me to conclude by summarizing the benefits which Canada derives from maintaining troops in Europe. This action:

(1) Is likely to strengthen our feeling of national unity, a fact which is far from being negligible at a time when Canada is seeking her own identity;

(2) Allows us to be consulted not merely as an expert, but as a full-fledged member of the Alliance, particularly regarding the future of European east-west relations or the problem of the progressive and reciprocal reduction of the armed forces of the Warsaw Pact and NATO;

(3) Marks our determination to espouse the purposes and goals of the Alliance which is a necessary instrument of change and of the peaceful settlement of disputes;

(4) Allows us to have a voice in the decisions of the Alliance, if not to direct them, particularly regarding the establishment of policies for the use of atomic weapons and the selection of military objectives;

(5) Allows us to resist more easily American pressures designed to sway our defence efforts in one direction more than another;

(6) Allows us to have a voice in the matter of peace and international security in Europe which should constitute one of the objectives of our foreign policy;

(7) Enables us to strengthen our ties with the continent and to be fully aware of the evolution of European policy which, at the same time, enables us to determine more surely the development of our own policy.

As to the nature of our contribution, it goes without saying that it should be simple enough to establish, if the principle of maintaining Canadian troops in Europe is accepted *a priori*. This is a problem which military experts can handle more competently and which should be resolved, I feel, in consultation with our allies and in relation to the type of troops it would be desirable for Canada to provide.

CURRICULUM VITAE

NAME: Albert Legault
PLACE AND DATE OF BIRTH: Montreal,
1938.

DEGREES:

B.A.—Montreal, 1959

M.A.—University of Chicago, 1961

Ph.D.—Geneva, Graduate Institute of Inter-
national Studies, 1964.

POSITIONS HELD:

1964-66—Successively Assistant and Research
Associate at the Graduate Institute of
International Studies, Geneva.

1966-68—Assistant Director of IPKO (Intern-
ational Information Center on Peace-Keep-
ing Operations), Paris, France.

1968-69—Visiting Assistant Professor (Queen's
University) Department of Political Stu-
dies, Kingston; Chair of Strategic Studies.

Hugh R. Stewart,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

(Text)

THURSDAY, February 27, 1969.
(47)

The Standing Committee on External Affairs and National Defence met at 8:10 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Brewin, Buchanan, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Howard (*Okanagan Boundary*), Laniel, Legault, MacLean, Macquarrie, MacRae, Marceau, Nowlan, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Stewart (*Cochrane*), Wahn, Winch (24).

Also present: Mr. Hymmen, M.P.

Witness: Dr. Theo Sommer, Deputy Editor and Foreign Editor of *Die Zeit*, Hamburg, Federal Republic of Germany.

The Chairman introduced Dr. Theo Sommer, who made an opening statement to the Committee.

Dr. Sommer's biography is printed as an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix oo*)

Members of the Committee questioned Dr. Sommer on various aspects of European defence and external affairs policies.

The Chairman advised the members about certain of the arrangements for the Committee's European tour.

The Chairman thanked Dr. Sommer for having accepted the Committee's invitation to appear as a witness on this occasion.

The Committee adjourned at 10:30 p.m., until Tuesday, March 4, 1969 at 11:00 a.m., when the witness will be Professor J. Granatstein of York University.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Thursday, February 27, 1969.

The Chairman: Gentlemen, it is past the hour so perhaps we can begin. The Committee is privileged this evening to have before it as a witness Dr. Theo Sommer. Dr. Sommer is in Canada to lecture at the National Defence College and has agreed to appear before this Committee on very short notice. I am sure the Committee very much appreciates this obvious willingness on his part to contribute to our deliberations on defence policy.

Incidentally, I believe that some of the members wish to discuss a number of administrative matters. Perhaps it would be most convenient to do that after we have heard from Dr. Sommer rather than at this point. It may be necessary to go into an in camera session depending upon the wishes of the members.

Dr. Sommer was born 1930. He is now Deputy Editor and Foreign Editor of the distinguished German weekly newspaper *Die Zeit*, published in Hamburg. This newspaper, incidentally, has a German language edition published in Toronto. He is also a Council Member of the Institute of Strategic Studies in London.

• 2010

Dr. Sommer has published many articles and several books on German and European security questions as well as writing on the subject for *Die Zeit*. He has also appeared on German radio and television programs as a political commentator.

Due to the short notice given to him, Dr. Sommer has been unable to prepare a written statement for the Committee. However, he has agreed to make an introductory statement on his appreciation of the European security problem, after which members will have the opportunity to question him. I have had the opportunity of a very pleasant short chat with Dr. Sommer and he speaks most frankly, and I know he will welcome questions on almost any subject.

I may also mention that I discussed with him the names of possible people to see while we are travelling on tour and he was most helpful in giving us the names of people of various points of view who will be of some help to us.

Dr. Sommer, would you care to proceed?

Dr. Theo Sommer (Deputy Editor and Foreign Editor of "Die Zeit", Hamburg, Germany): Mr. Chairman and gentlemen, it is indeed a great privilege for me to be able to testify before you. I realize that you have been pondering the momentous matter of your country's alliance commitments for some time now. As the Chairman said, I did receive your summons only at very short notice so I have not been able to submit a written statement to you. I offer my apologies for that, but I will try to make up for this by putting a few introductory remarks on record in what I hope will not be a too disjointed fashion.

I happen to be a German citizen, but I shall try to take a kind of homogenized European view, rather than tackle my subject from a strictly parochial German vantage point. I do not hold any brief, of course, for anyone, and I would not even try to speak for Gaullist France. I should think, however, that outside France the European defence and foreign policy community would not find my presentation too objectionable. By the way, I do beg your indulgence if my handling of the Queen's English is not up to the normal standards of elegance and eloquence that you are used to in these chambers.

Mr. Allmand: It is better than in the Maritimes.

Dr. Sommer: I have proposed, Mr. Chairman, to address myself at the outset to two aspects of the European situation, the defence aspect and the detente aspect, and I will try to explain how in my view Canada fits into this in regard to both defence and detente. Let us take defence first.

The first thing to say here is that since the late forties and the early fifties the nature of the threat to which Western Europe and with it the Western Alliance was exposed has basically changed. A general war, or a central war as it is called in Pentagonese, with its incalculable consequences is not a likely contingency today nor, I think, is a massive attack in Europe a possibility of great reality.

There is still the danger of an armed clash arising from miscalculation or accident and also the danger of swift, limited thrusts across the central European divide, yet neither of these has a very high probability rating. Still, I think it is important to realize that this change in the threat from the East is the direct result of NATO's defence efforts. There is a cause and effect relationship here and if you do away with the cause you are likely to lose that particular effect too.

There is another point we would do well to bear in mind. It is true that Soviet aggression against Western Europe can now be rated exceptional rather than normal or natural, but it is also true that East-west crises could recur and if the instrument which helped to master past crises were dissolved this might conceivably lure the Kremlin leaders back on to the irrational path of adventure, and after Prague I think no one can afford to neglect this possibility.

• 2015

If Prague proved one thing it proved that whenever it can do so without fear of retribution, the Kremlin hits and hits hard.

In the old German army they used to have an offence called in German:

Verfuhrung zum Kameradendiebstahl

seducing your comrades to theft. When you left your locker unlocked, then not only the thief was punished, but also the chap who left his locker unlocked, and if we let our defences run down in Europe today we might really offer a seduction to the Kremlin leadership.

I would like to say a few words about the military effect of the Soviet occupation of Czechoslovakia because I think it has a direct bearing on our topic tonight. I do not share the facile assumption that the Soviet occupation of Czechoslovakia weakened the Warsaw Pact: I think this view has been put before this Committee. It is true that the 14 Czech

and Slovak divisions cannot be relied upon for the moment, but I am sure if the Czech affair comes to a conclusion at all, in the sense that the Soviets want it to be concluded, then these divisions will be part of the Eastern armed forces again.

I have recently heard that the Czech Air Force is already training again with the other air forces of the Warsaw Pact, and if you look at the historical precedent of the Hungarian uprising in 1956, in 1958 I think it was, the Hungarian army for the first time took a full part in Warsaw Pact manoeuvres again. So this is a passing phase. I would not put too much importance.

On the other hand, I do not share the alarmist view either. Today the Soviets have reduced their garrison in Czechoslovakia to something between 50,000 and 70,000 men. These are deployed inland obviously with police tasks in mind rather than military tasks. Of course, this nucleus is enough to prove to the Czechs and to the rest of the world that the others can always come back, but I do not think that Czechoslovakia, if you look at a map of Europe, is really a very sensible place from which to carry forward an attack against the West. The traditional route of invasion lies through the north German plains and, anyhow, if the Soviets put many troops into Czechoslovakia permanently they would be singularly maldeployed there because they would be facing the strongest units of the NATO defence establishment in Germany, that is, the 7th Army of the United States.

Some changes have to be noted. There are more Soviet divisions deployed west of the Vistula now than there were before August 21 last year. The Soviet Red Army has proved its extreme, surprising mobility. It has conducted manoeuvres and has shown that it can camouflage large-scale operations as manoeuvres which give it a flying start for anything they may have in mind, and our warning time estimates may, indeed, have to be reconsidered. Basically, however, it is my thesis that the threat from the East has not changed, at least the military threat has not. What has changed, however, is the political atmosphere and the political threat.

I submit that the Soviet intervention in Czechoslovakia has created new uncertainties about the intentions of the Soviet leadership,

and the Brezhnev doctrine proclaimed last year after the event has further increased

• 2020

these uncertainties for it creates a precedent out of what might have been an aberration. It is ambiguous, ill-defined in its geographical delimitation and it is particularly disquieting to me because it was formulated against the backdrop of a theological debate, again going on in Russia now, between the Russian military and the technocrats, a debate in which the view has been put forward by the military that nuclear war was not, as Khrushchev had reasoned, an unusable instrument of politics and policy in this day and age. These military people now in this debate going on at present in Russia take the view that nuclear war has its political uses.

All this, in my view, adds up to the simple conclusion that the Atlantic Alliance is still necessary; it would be quite foolish to tear down NATO fences before being sure that they are not needed any longer or before a reliable new security system could take their place.

Today, gentlemen, security is provided by the means of deterrents on the one hand, and, in the event that deterrents fail, by the means of defence. This means there must be the ultimate deterrent provided by the United States, but there must also be enough non-nuclear forces to guard against the danger of small-scale incursions across the demarcation line. If such forces are lacking we will, indeed, be confronted with the bitter alternative recently formulated by Dennis Healy, *Suicide or Surrender*, and in my view it is here that Canada's contribution to European defence comes in and weighs more heavily on the scales than is sometimes realized, it seems to me, in this country.

Mind you, it is not only a problem of numbers of troops: it is (a) a question of quality, and everyone in Europe is agreed that you have first-rate units over there and that especially your air division consists of the toughest flyers that can be found within NATO today; and it is (b) a question of principle, the principle being that any aggressor should need, if he attacks, as many Western allies as possible as far forward to the demarcation line as possible. In this expectation on the other side lies the actual deterrent value of even small allied contributions. It is the

presence on the ground of even small units that guarantees the involvement, in the event of war, of as many partners as possible; it is not the actual clauses of the Treaty, such as under the operative clause of the NATO Treaty. The assistance to be extended by any one partner to the attacked party may consist of a letter of "condolation" or of an H-bomb; it is up to each individual government.

Therefore, to make no bones about it, to my mind, if Canada withdraws her contingents from Europe, that may well trigger off a deplorable chain reaction. Your decision is likely to have a catalytic effect in Belgium, in Holland, possibly in Denmark and Norway and possibly even in Germany. There would be such a tremendous thinning-out that we would have to fall back on the old massive retaliation strategy which was implausible when it was formulated by John Foster Dulles in 1964 and which is totally incredible today.

• 2025

I do not want to be misunderstood. I do not mean to say for a moment that there should never be any thinning out. If the evolution from confrontation to collaboration, which was interrupted by the Czech tragedy, is resumed sometime in the future, a thinning-out of the military installations on either side of the Iron Curtain—on the Western side, too—will one day certainly be on the agenda. However, I would like to make three points in this connection.

The first point is, I cannot see why Canada should want to be the one that is pulling the stopper out of the bathtub.

The second point is that whatever we do in the way of troop reductions should not be the result of individual and separate decisions, but the outcome of joint deliberations, and I wish Canada could set and would set an example to the others in how one arrives at joint decisions jointly within the Alliance.

My third point is that in these deliberations Canada has an important role to play. It can help establish sensible criteria for troop withdrawals and see to it that the modalities of any pull-out are such that the forward garrisons can be speedily reinforced in times of crisis.

If you will bear with me for another few minutes, I would like to say a few points about the second aspect of my topic—*détente*.

I say, first, that despite Czechoslovakia, as I see it, *détente* still has a future, not in the very short term, but certainly in the long term, and in the medium term is ready. I do not think that Czechoslovakia has changed for good the basic tendencies that were operating on the European scene before the August 21. These tendencies are submerged at the moment, but they will reassert themselves and I think bridge building between East and West must continue: at least the West must be ready to continue at any time or as soon as the other side is ready for it again. However, we should not delude ourselves as to the speed with which progress can be made; I think after Prague there is no room left for euphoria on this score.

The question is how do you get *détente* or how do you manage it, because what the alliance needs is not only crisis management in the military sense; it is also *détente* management in a political sense.

Let me say, first, that I think the view that Alliance membership and *détente* are mutually exclusive is quite mistaken. Destroying NATO in the way General de Gaulle set about it a few years ago was not a all an instrument of *détente*. I think he rested his case on the assumption that if greater emphasis on national sovereignty were to be laid in Western Europe, then a similar development could be encouraged in Eastern Europe, and that in this way gradually we would arrive at a reunion of the two halves of Europe. It was also his assumption, therefore, that any loosening of the Alliance cohesion on our side could be expected to produce a similar fragmentation on the other side.

• 2030

I think the invasion of Czechoslovakia has proved conclusively that this assumption was wrong. Never was NATO more amorphous, more fragmented, more disunited than before August last year. The Soviets marched into Czechoslovakia at a time when NATO was coming unstuck and when it was quite pacific in its whole outlook. This did not induce the Soviets to permit a kind of mirror image development on their side. They rather took advantage of this loosening up on our side to consolidate their own empire again. I put to you the idea—I am not quite sure whether it makes sense, but I think it makes as much sense as some of the other ideas we have

entertained in recent years—I put to you the suggestion that possibly *détente* can be managed much better on a bloc-to-bloc basis, on a pact-to-pact basis, than by a multitude of bilateral approaches. I am led to think so because only a bloc-to-bloc approach will calm and can calm Russia's fear that *détente* basically is nothing but a means of subversion, a means to break up the Eastern bloc.

Another remark. I had the privilege of listening to part of Professor Legault's testimony this morning and he was talking about the three concentric circles in which *détente* has to be conducted. I would use a different metaphor. I think of *détente* as something going on on three different levels of one and the same building: on the top floor, the super powers, who have to address themselves to some problems which are peculiar to them—strategic arms limitation and so on; on the second floor, the middle floor, Western Europeans and Eastern Europeans; and on the first floor, West Germans and East Germans. That does not mean that the Western Europeans, for instance, should not try to have good relations with Moscow too or that West Germany should not try to have relations with Moscow too. There are staircases in this *détente* structure I have been sketching for you, but on the whole I think that *détente* has to be conducted on these different levels with these different foci, with NATO—and this is my point—with NATO acting as a clearing house, if possible; if not, as an instrument of *détente*.

I do not know whether I should impose on you any longer by inserting a few remarks here about the German question. I would say this: that Germany for several years and especially under the new Grand Coalition Government, which came to office towards the end of 1966, has fully embraced the concept of *détente* and is willing to pursue a policy of reconciliation. These are the three addressees: Soviet Russia, the Eastern European nations and East Germany.

We have tried to initiate conversations with the Russians about a mutual agreement not to use force. We were on the verge of coming to terms with the Czechs when the tragic events of last August intervened. Under the agreement then envisaged, the old quarrel about the validity of the Munich agreement, extant or not, would have been terminated.

● 2035

We have offered talks to Poland and while not publicly renouncing forever any claim to the territories east of the Oder-Neisse Rivers, government speakers and prominent figures of the two government parties have made it clear that the Germans do not expect, really, to get these territories back, ever.

We have instituted important changes in our relations with Eastern Germany. We now recognize that there is a kind of state over there, although it is not a kind of state the authorities of which we like or morally approve of. We have said re-unification is not something that is around the corner. It may be a long time off, decades off, possibly. We have to have an interim policy and we have offered talks to the East Germans too. We have said the most important thing is to make partition, if it cannot be ended, at least more tolerable. So far they have refused to talk about this. The point is, however, that we are ready for conversations any time. We do not have any legal reservations anymore. Now we can think ahead into a future in which two Germanies would exist side by side, would co-exist peacefully, and our only condition for this would be that the other side does not insist on the fact that this co-existence is conducted in a very hostile fashion. We want the cold war to be ended between the two Germanies. We are ready to end it on our side, and if East Berlin would oblige, we would be ready to entertain a good many ideas which would have been unthinkable in West Germany 10 years ago. One of these ideas is that perhaps re-unification is not the ultimate national destiny of Germany, must not be the ultimate national destiny. I have said that it must be the policy of the German Government to bring about either re-unification or conditions that make it superfluous, which means that partition must be bearable, must be more humane. This is not a nationalist approach any longer, as you will notice. It is basically a humanitarian approach. We also realize that re-unification, if it ever comes about, must come about within a wider settlement. It must put to rest the fears and doubts our Eastern neighbours have as well as our Western neighbours and friends. I think we have not given up the ultimate aim of re-unification but we are familiarizing ourselves with the idea that it may not be had and we are willing to say

now, "Let us have re-unification if it is possible or let us keep partition if it is tolerable."

In concluding, in this whole *détente* process, even in the thinking about *détente*, how do you go about it, what can you offer, what machinery do you institute? In this whole process the small powers have a role to play. I am not only thinking of the two Belgian statesmen, Paul Henri Spaak formerly, and now his successor Pierre Harmel, but I am thinking of Halvard Lange of Norway; I am thinking of your own Lester Pearson. I think these people have contributed to the political side of NATO and to thinking about *détente* far out of proportion to the weight of their respective countries and I for one would

● 2040

hate to lose the wise counsel of the Canadians on the NATO council when questions of such import are taken up. It is sober minds like those that you have been wont to despatch onto the international scene which we need to keep us from backsliding into the habits and the easy formulae of the cold war. This is, I think, the advantage we get out of your continued presence in NATO, and I think the advantage you would get out of it is that you have a say in the future of a continent for which and on which you have twice, within a generation, spilled your blood and your treasure.

Just one final remark. If you do pull out, one question will come up and it is a very serious question. If you pull out and if that then has a catalytic effect elsewhere, who will fill the vacuum? If the Germans increase their military strength to make up the difference, that will stir old fears all around and it will increase tension in Europe rather than decrease it; and if we thin out, if we follow suit, it will increase the risks in an international situation which is fluid and risky enough as it is. So once more I think it would be a pity to go without your counsel within NATO as it would be a pity for you to leave the business of Europe unfinished. Your continued stay, in my view, helps to minimize the dangers of the present situation and it helps to increase the changes of a hopeful evolution in the future. Thank you.

The Chairman: Thank you very much, Dr. Sommer. I have a long list of questioners. The first is Mr. Hymmen.

Mr. Hymmen: Germany is, of course, one of our very important partners in the NATO alliance but there has been concern occasionally and there was a question at our meeting this morning about German militarism. There are many views on this. One view is, of course, the one which has been stated as being the real purpose of the NATO alliance, to prevent a resurgence of German militarism. At the other extreme is the view which I noticed was expressed in the U.S.S.R. press, that by the creation and the operation of NATO over almost 20 years we have provided for this very opportunity. I do not hold to either of those views. You may like to make a comment. I have two other related questions I would like to ask. They will be short. I do not know if you are familiar with a study published in 1964 made by a Professor Eric Waldman who was formerly at Marquette University and is at present on the staff of the University of Alberta. The study was made under a NATO fellowship and the publication was called *The Goose Step is Verboten*. Professor Waldman in his study found that in 1964, which was 18 years after the end of the Second World War, there was a strong anti-militaristic attitude in the general public in West Germany. He also found strong evidence in the Bundeswehr itself of a strong responsibility for a free Europe in the NATO alliance. You have answered part of this question in your previous statement. What is the general view of the German people in regard to the presence of NATO forces, including the presence of Canadian forces whom we are told have no useful purpose in the NATO alliance?

On the third question, I say there has been some concern about German militarism. Canada and Canadians including even our CBC has had some concern about another matter, and while I am not asking you to go into the realm of German politics, there has been some concern about the NDP and whether it is correct or not, there is some suggestion that the very presence of Von Faden and some 20 of his party members in the free City of Berlin may have prompted the recent crisis of a few days ago. I think you have explained the position of your coalition government on the NATO alliance. What is the official view or policy of the extreme right wing faction, the NPD?

• 2045

Mr. Winch: Do not get your initials mixed up, now!

Dr. Sommer: That is a whole range of questions, and I will try to take them one by one. First of all, your question on German militarism: I can only make a profession of faith here. I know that in Western Germany, that the generation of Western Germans now living is no longer militarist. If I may say so, one does not lose two wars disastrously, one of which you started beyond any doubt, without somehow learning a lesson, and I would fully agree with the diagnosis by Professor Waldmann of The University of Alberta.

Secondly, what do the Germans think is the purpose of the presence of foreign—I would say allied troops on German soil? I think we feel they are there as friends. Their purpose is not only to defend the Germans, but Germany simply happens to be their own frontier too, if you look at it in terms of world-wide confrontation. The first purpose of these troops being stationed in Germany is to guarantee the security of Germany along with the security of all the other allies; is to prevent, I would also say, the human, technological, industrial, potential of Western Europe falling into the hands of the Soviet Union. The second purpose is to provide the firm foundation for that time-consuming, protracted process of making Europe whole again.

Your last question related to the NPD. I could lecture you on this no end, but I would like to be brief. First of all, you get cranks in every free society. Secondly, if they are right wing cranks and if the society is the German society, they bear more careful watching than elsewhere. Thirdly, they seem to have a peak and hit a peak about two years ago when they polled as much as I think 13 or 12.8 per cent in some provincial elections. They have now taken a dip again; they are down to between 5 and 6 per cent. I have no way of foretelling what percentage they will poll in the September elections, but I think the mere fact that we have a functioning government again in Bonn that gets things done, that managed the economic recession and that gives the appearance of governing again, has reduced the following of the NPD and I, for one, would not consider them, though I would keep watching them very closely, a danger to the democratic fabric of present day Germany.

Just by way of conclusion, it is so easy to look at the 8 or 10 per cent always they have polled in various elections, but the really important figure is the 90 or 92 per cent of those people who have voted for democratic parties. Thank you.

• 2050

The Chairman: Mr. MacLean?

Mr. MacLean: I will limit myself to one or two questions, and try to be brief. Dr. Sommer, you spoke about the change in the view of West Germany with regard to the unification of Germany, and that two separate Germanies, as long as the situation was tolerable would serve as an alternative and that unification is perhaps a long way off. Is there any change in public opinion, if there is such a thing, in East Germany with regard to this same problem? I am not thinking of the official view of the government so much as I am of Germans generally who are living in East Germany?

Dr. Sommer: Well, sir, it is very hard to come by reliable data there. My last trip to East Germany was five years ago. At that time I seemed to detect a beginning of, I would not say national consciousness, but a feeling that they were separate from us, and in a way different from us. They are proud of their achievements which they achieved under much harsher conditions than we did in West Germany. We had Marshall aid; they had to ship reparations to Soviet Russia. Also, the younger generation possibly is getting used to it. They do not like their system, but they are not quite convinced that our system is the best one either. So I sensed then, and I hear this confirmed occasionally from recent travellers, that they would want to be together with us, but that they have a sense of distinctness now and they, I think, would also settle for a kind of German—you might call it union, or federation, or confederation—in which the two Germanies were different from each other but not alien to each other.

Mr. MacLean: Thank you very much. I have one other question which is just a confirmation of, or perhaps asking you to expand on, what you have already said in one regard. We have had witnesses before this Committee who, if I understood them correctly, held the view, which I think is very naive, that had NATO not been created, that the expansion

of Russian domination in Eastern Europe had ceased anyway, and that we are contributing to NATO for no valid reason, and to prove this assumption that the thing for us to do is, to prove that rape is not in their minds, to immediately disrobe, from the military point of view, to prove the fact. My view, however, is that the Eastern bloc, Russia in particular, is very pragmatic and if there were any choice crumbs lying around which they thought they could pick off without any great risk, they would be liable to do so, even yet.

• 2055

Dr. Sommer: Well, sir, what you are asking me for is an act of retroactive prophesy. I agree with the feelings that seem to be underlying your statement. I think that at the time, in the early fifties, even if the Soviets perhaps did not have the intention to push to the Atlantic, Western statesmen did well to assume that they might do so. There were enough indications that they might just want to do it, and we had to guard against that. I do not think that by dismantling NATO now you could prove the case, and if that experiment ends the wrong way, we have all had it. As I said before, I would not leave my locker unlocked.

The Chairman: Mr. Stewart?

Mr. Stewart (Cochrane): Thank you, Mr. Chairman. Dr. Sommer, I would like to congratulate you on your beautiful English. We have been hearing and studying a great deal too, about NATO in general, and what is uppermost in our minds is not whether or not NATO should in itself continue to exist but what Canada's role should be; whether Canada should withdraw completely, or, if Canada does not withdraw, what its role should be. You mentioned that Canada's withdrawal could trigger a massive withdrawal of other European countries. I find this rather difficult to understand because I do not think that Canada is such a large and important country that we would have that much influence on all of the other countries, in addition to which I wonder if other countries feel that Canada should be solving all of the problems of the world. Certainly, Canada is not large enough to be on every front. At present we are involved in the NORAD aspect. The countries of Europe are not. This is a part of the NATO participation. It seems to me just as reasonable to assume that Canada should not necessarily be taking part in some other

aspect of NATO which the European countries are taking part in. When we consider what our role should be and assess it, we are considering one possibility as the presence in Europe, whether or not that presence should be removed or reduced. We are considering our participation in NORAD which, to my mind, is the most important thing for Canada, and it is a part of the NATO alliance. We are to consider our naval contribution. We are asked to consider also whether Canada should have a peacekeeping force. It has been suggested by one of our witnesses in particular that Canada should have a mobile force. There are others who go along with the idea that the mobile force should be stationed in Canada and ready to be deployed anywhere else. These are all of the considerations which are uppermost in our minds as we are trying to review this NATO problem.

I wonder, Dr. Sommer, if you could give me a little comment on this matter which would convince or help to make me understand why you think that Canada is so important in Europe when we are already committed on this side of the ocean. Would you also comment on my statement that we cannot be solving all of the problems of the world, and we are already involved in Norad, and perhaps we should not be involved so much actively in Europe.

Dr. Sommer: Well, sir, I will try to do some thinking out loud. First of all, I do not think the case is specifically addressed to Canada. I had meant to indicate that when I said I would hate to see Canada be the one that pulls out the stopper. It could be Belgium, or it could be Denmark, but, as it looks, it might be you. Personally, I think that would be deplorable not because I overrate your influence—maybe you underestimate it too—but you would be tipping the scale at a very precarious moment and you would set a precedent of independent action and autonomous decision at a time when the alliance should find its way back to the old ways of concerted action, rather than independent action.

Now, I appreciate your problem about the multitude of tasks which is before you, but I have no way of judging whether you simply have to cast off some of them or whether you simply would like to, whether they are unbearable or whether you would want to drop some burdens in order to pick up other

ones. If the latter were the case, I would ask what other roles you have in mind for Canada and if you have others in mind, what would you get out of that?

• 2100

You are already contributing to the Mobile Force. Mobile forces are a good thing, but if you earmark them in advance that they be used only on the flanks or only on one flank, you reduce that element of flexibility which NATO needs to pose a resistance to any adversary. You are talking about peacekeeping. So far your NATO membership has not encumbered you in your peacekeeping role, has it?

Mr. Stewart (Cochrane): That is right. It has been a limited role, though.

Dr. Sommer: It has been a limited role. Now the question would be, do you really foresee in the next 20 or 30 years a great many conflicts in which peacekeeping in the old sense would do any good? I notice, for instance, that there is no peacekeeping force whatsoever in Nigeria at the moment, and I sometimes have a feeling that the Nigeria-Biafra affair is the first of many conflicts which we are going to see in the last third of this century, in which the intercession of white troops, whether they wear blue helmets or other helmets, is not desired, and is not at all feasible or effective.

If you will permit me a personal reflection, I do appreciate the moral impulse behind your desire to involve yourselves in the development of the third world, both politically and economically. But with due respect, I think you and everyone else who is trying—and we all are trying to some extent—are in for frustrations. The third world will probably frustrate you more than NATO ever has.

Mr. Stewart (Cochrane): Thank you.

The Chairman: A short supplementary question from Mr. Brewin. You can continue first, Mr. Stewart.

Mr. Stewart (Cochrane): I wonder if you could tell us what the attitude is in Europe towards Canada's participation in NORAD. Do they think it is in effect a participation in NATO, or do they consider it as something completely separate?

Dr. Sommer: I throw the question back to you. Do you consider a German or French participation in NADGE as a contribution to NATO and to your security here, or something separate? I think this is the fence around our individual houses. For you it is NORAD. It must be up to your own discretion whether you think you want a fence or not. For us it is NADGE, which is a similar thing except on a European scale. So I do not see that there is an alternative, being either in NATO or in NORAD.

• 2105

If I may just mention one point, there are all kinds of models, even within NATO. You have the French model which means you pull out of the military organizations but you leave your garrison in Germany. I have heard references in this country to doing a de Gaulle. But doing a de Gaulle means peeving the Americans but staying in Germany. Then you could follow the Scandinavian model which means you are a full member but without a military contribution to the central front. For reasons which I have indicated in my introductory remarks, I think you ought to remain involved on the central front. Then there is the Icelandic example. You are a full member in everything but have no military contribution whatsoever and therefore no influence.

Mr. Stewart (Cochrane): Thank you.

The Chairman: Mr. Brewin on a supplementary question.

Mr. Brewin: Dr. Sommer, on the question of the catalytic effect of Canadian withdrawal or reduction, or change of role, I think you have made an extremely lucid case for Canada remaining within NATO, but I find this catalytic theory very unconvincing. Surely the nations in Europe cannot be much concerned about their own security if they are going to follow the example of Canada, and if the withdrawal of a rather insignificant North American Military force is going to set off a sort of domino effect and the whole set-up is going to collapse. If the situation is that weak, we should not be trying to hold it up. If we are the people who can pull the plug out of the bathwater, it must be about time the bathwater was changed. It seems to me you are putting your case there on a very unconvincing basis.

Dr. Sommer: I can see why you would say so and think so. I will try to elaborate my case, and maybe it is a case of changing the bathwater. I think the detrimental effect of your pulling out would not be that we are losing 6,000 Canadian troops and roughly 100 aircraft, but we would suffer a complete change of the psychological climate. There would be less dedication to an alliance, an international organization from which even the normally or formerly internationally-minded Canadians withdrew. I think this would be one effect in Europe. What kind of an organization is that if even the Canadians want to get out of it?

I will go further. If we have to thin out, and we all have our reasons to unburden ourselves, let us do it together. Let us not do it separately and individually, but let us do it together and let us do it in an orderly fashion that will permit us to keep up the defences of Europe on a different basis. I put to you the idea which was bandied about in Europe before the Czech crisis, and which is bound to come up again, that we put our strategy on a new footing, that we shift it from a strategy of presence on the ground to a strategy of mobilization, which for the Europeans would mean installing huge territorial defence systems, using their reserves which they are not doing now, and which for the Americans and the Canadians would mean providing air transport, fast deployment ships, and war material depots in Europe to which you can fly your troops in case of need.

• 2110

If this is what we want to do, what we all feel is cheaper and possibly more effective, then let us do it. But let us do it together and let us do it as a result of a sober exercise of thinking and not as a result of, I would say, a separatist impulse, whoever might give that impulse.

Mr. Brewin: You say that we should do this in consultation, but is it not within the whole concept of the NATO alliance that the role for each country should be one suited to it, and suited within its own thinking, as it were? While we should not unilaterally declare what we are going to, if you say we should consult, surely we have to have a clear idea in our own minds what an appropriate role is, instead of just doing what is sometimes suggested, carrying on what we

have done before because we did it before, as if somebody says, "It will have a disturbing effect if we change"?

Dr. Sommer: I see your point there, but I think in this regard NATO simply is not just any old-fashioned alliance. It is different from former historical alliances, in as much as we have acquired the habit and the custom of making decisions together. At least that is what we ought to be doing from now on, instead of making decisions separately and then springing them on the rest of the alliance. So I think even if you in this Committee and your government in another committee came to the conclusion that Canada ought to remain in NATO but withdraw its contingent, even then, I think, there would be a necessary phase—you should I think subject your vote to the votes of the other allies. There should be a review of the alliance, too. But I see your point. I am also afraid I cannot convince you.

Mr. Brewin: You can never tell.

The Chairman: Mr. Anderson and then Mr. Macquarrie.

Mr. Anderson: The statement that you make, sir, that there must be enough non-nuclear forces to handle incursions, is I think probably tied to the idea that you should have as many people forward as possible. Is that right?

Dr. Sommer: It is, but I say not simply as many people forward as possible, but as many different people forward as possible, troops from different nations.

Mr. Anderson: Yes, and then you went on to speak about speedy reinforcements, the idea being the more you had forward the more reinforcements would be likely to arrive. Would that be a logical assumption?

Dr. Sommer: I think that would be logical.

Mr. Anderson: I think the Czechoslovakia crisis did show that the Warsaw Pact is quite capable of putting on an enormous military push very quickly, and that probably our European NATO defence would be inadequate in the strictly non-nuclear sense. I think this is accepted. This is realized and accepted, and I think it is shown by the fact that many of the tactical weapons in Europe are nuclear.

Would you say that we have enough forces to push back a non-nuclear incursion? Would you still say that in view of the fact that probably nuclear or thermonuclear weapons would be used in handling such an incursion? It seems to me that we would so soon get into a nuclear war in Europe that the actual numbers on the ground along the front would not be as important as the American determination to back up nuclear exchanges in Europe with perhaps continental exchanges of missiles.

• 2115

Dr. Sommer: But, sir, I think the principle would be that you use as little force as possible and as much as necessary. If you can cope with an incursion by strictly conventional means, it is perfectly all right—you would never think of using nuclears, not even tactical nuclear weapons then. But if that incursion is larger, or so large that you cannot cope with it by strictly conventional means, you may want or you may have to use tactical nuclear weapons. So the enemy knows that too, and he knows also that the step from tactical nuclear weapons to strategic nuclear weapons is very small. He knows that once you get on that ladder you may get higher up much quicker than you think. So there is a deterrent effect at the lowest rung of the ladder already. And mind you, you are in the tactical nuclear business too.

Mr. Anderson: Exactly, and the step between the conventional and the tactical nuclear is very quickly taken. I can see few occasions where an incursion would not result in very quick, if not immediate use of tactical nuclear weapons.

Dr. Sommer: I do not know, maybe your sources of information are better than mine, but I should have thought that the step from conventional weapons to tactical nuclears is much bigger than the step from tactical nuclear weapons to strategic nuclear weapons. I think the threshold is between conventional and any kind of nuclear.

Mr. Anderson: My information is certainly not as good as yours, but it seems to me that in the light of the tremendous force that can be put against NATO at any one particular point along the NATO line the use of tactical nuclear weapons would be almost immediate in case of a serious incursion by Warsaw Pact forces across that line.

Dr. Sommer: Well, I do not want to get into a semantic squabble about the meaning of the word incursion. I mean by incursion a border violation or getting possession of a city within, let us say, 20 kilometres of the demarcation line, or something like that. If there is more than that behind, if this is just the thin edge of the wedge, then of course the process of escalation will get started very quickly. But the other side knows that very well and it must realize before that this will happen—which again means it is taking nuclear war, central nuclear war in its stride. Now if the Russians, or whoever the potential adversary might be in the 80's, is determined to have a central nuclear war, there is nothing that can stop them. Then the Canadian contingent in Germany will not make much difference, nor will any of the other troops stationed in Germany—except in one role of course, that even in a full-scale nuclear exchange the position of the actual terrain may still make a difference to the outcome.

I would like to make one more point. You referred before to the Russians assembling huge armies for the Czech invasion. Now I think NATO knew all along that this mobilization was not a mobilization that could endanger NATO, that it was geared only for a Czechoslovak operation. If they had really meant to concentrate troops for a large-scale massive attack across the European divide they would have had to back it up with 60 or 100 reserve divisions in an area in which they had nothing. We would have detected that and we would have detected it—to remain in the time scale of last year—in May or June at the latest, and that would have given us the opportunity to reinforce our troops on the European continent.

Mr. Anderson: Could I turn to one other point, sir. You mention that Germany at present fully embraces NATO, you also mentioned the uncertainty that might come if Canada and other nations that you suggested, Belgium, Holland, Denmark, and so on, pulled out. Do you think this would lead to an irresistible political force within Germany to acquire German nuclear weapons, if there was such a weakening of NATO?

Dr. Sommer: Frankly, I do not think so—and I have given a lot of thought to this and have written about it several times. There is no body of opinion in Germany that would favour a German national nuclear develop-

ment. Even in the whole field of journalism and the media I know of only one writer who has ever broached the idea, and he significantly is a re-immigrant from the United States.

Mr. Anderson: Yes. But even in the same circumstances that I have suggested.

Dr. Sommer: Let me put it very simply. As long as we have the protection of the American nuclear umbrella we will not need a national nuclear force. If that American protection is withdrawn from us a national nuclear force of our own will not be any good at all, it will not serve the purpose, it cannot substitute for the American protection. And do not be misled by our squabbling about the nonproliferation treaty. We are trying to keep a few options open to us, but the option of a national nuclear force is not amongst them. The option is technological and scientific—and I will conclude on this note, it is European. I think the alternative we would turn to, if NATO came unstuck, would not be a German national nuclear force, because the political disadvantages of such a move would be so grievous, but a European nuclear force, if that is at all possible. In fact, that is one of the options we have fought to keep open in the nonproliferation negotiations.

• 2120

Mr. Anderson: Thank you very much.

The Chairman: Mr. Macquarrie.

Mr. Macquarrie: The Professor's presentation was both clear and cogent and I have very few questions. I may say that there was one part which surprised me. You rather lightly, I think, but nevertheless did suggest a sort of cause-effect relationship between the loosening of NATO as a result of what has been done by and in France and that taken as an opportunity by the Soviet Union to consolidate its empire in Czechoslovakia. I had thought that Czechoslovakia would be, to use an old-fashioned term, a sphere of influence that would be unchallenged and unchallengeable regardless of NATO's cohesive strength.

Dr. Sommer: I think I said it was the assumption of General de Gaulle that if NATO loosens the Warsaw Pact would too, and I said that he was wrong in this calculation. I think in the long run the Soviets have undermined their influence in Czechoslovakia

much more grievously by invading Czechoslovakia than if they had stayed out or just sat it out. I would grant you that Czechoslovakia lies within the sphere of influence or preponderant power of the Soviet Union, but I would also say that invasion is not the only means of exercising Soviet influence. There are other means thinkable. They were not thinkable to this particular crew of Kremlin leadership, but they may be thinkable to future Kremlin leadership. At least I hope so.

Mr. Macquarrie: I am interested, too, in your references to your own country's contact with some of the countries in the Eastern Bloc, as it is called. As I recall, some months ago and certainly before the August date you mention, there were contacts developed with Roumania, both economic and diplomatic, and with other countries. Is there at the present time any resumption of this particular thrust?

Dr. Sommer: There is a readiness on our side to resume but we realize at the moment we would only embarrass anyone to whom we extend our hand. So we play it rather cool even in our relations with the Roumanians. They have trouble enough as it is. We suffer, tongue in cheek, the Czechs making all kinds of unfriendly noises about West Germany again, which they have not done for a year. We feel that it is the minimum show of solidarity they probably have to make, at the moment, and we do not take any offence. But with Poland it is hopeless at the moment. I do not know about the latest developments in the West Berlin-East Berlin talks about passes for Berliners, but on the whole I should have thought that East Berlin at the moment is not in a mood for serious talks—not in a mood to consider our offer of putting off re-unification and making things work, and making them a little more human in the meantime. We are getting along fine with Yugoslavia. Anyhow, we are ready for anything the other side feels ready for.

The Chairman: Mr. Allmand.

Mr. Allmand: Dr. Sommer, you stated in analyzing the Kremlin situation that there had been, as you described it, a theological debate going on in the Kremlin between the technocrats and I think you said the theoreticians or the politicians.

Dr. Sommer: I said the military.

Mr. Allmand: The military?

Dr. Sommer: Yes.

Mr. Allmand: Do you identify this with what we understand as a debate going on in the Kremlin between the so-called hawks and the doves? If not, do you think there has been a very contested debate between the Soviet hawks and doves in the Kremlin? But after you analyzed and made that statement you went on to say, and I tried to write it down, that there was a new uncertainty in the Kremlin and that there was a new policy that was now acceptable, that nuclear warfare had its political uses.

• 2125

Dr. Sommer: Might have.

Mr. Allmand: In your assessment, would this mean that the Kremlin hawks are on top for the present?

Dr. Sommer: No, sir, but it means that they are speaking out again, or whatever hawks do, which they have not for about five years. I did not use the term "theological debate" for nothing. It is a theological debate revolving around quotes from Lenin and Clausewitz. The decision of some militaries seems to be that the Khrushchev line, that nuclear war is out and for that reason one should not even consider a whole range of political action, was wrong, that it limited the sphere of action of the Kremlin too much, and that possibly nuclear war was an instrument of policy, after all. If you want the details on this, the best analysis of it that I have seen was given by Victor Forza in *The Guardian* about four weeks ago.

Mr. Allmand: I was going to ask you what evidence you had that this theory was now being put forward.

Dr. Sommer: He quotes chapter and verse on this from the official military and ideological publications.

Mr. Allmand: But you do not feel that there has been any conclusion to this particular debate or that any one group is definitely in control of the Kremlin.

• 2130

Dr. Sommer: No, I do not think there has been any conclusion, and frankly I do not know what the West could do to influence the outcome of the debate in a way favourable to the West.

Mr. Allmand: Some people suggest that by reacting to Czechoslovakia by beefing up our defences, and so forth we will only help the so-called hawks in the Kremlin and give them a better position in gaining control and, therefore, lead not to *détente* but to a building up of forces on both sides.

Dr. Sommer: I have seen that argument. I have also seen the obverse argument that if the West gives in now and appears meek this may also strengthen the position of the hawks, because they will be able to point out that as soon as they make some martial noises the West comes around. By the way, with due respect I do not think we are doing anything that could be called beefing up the Western defences. What all the governments are doing now is enacting a few bills which they have had in their desk drawers, some of them for years, and they used Czechoslovakia as a good excuse to finagle the money out of their parliaments.

It is not really a reaction in any way comparable, for instance, to the reaction after the first Prague coup in 1948. That really set off the cold war. Now, this time I could not say that we are conducting a cold war again. In fact, I would say the period of mourning is over already. The Americans are straining for talks with the Russians. General de Gaulle had the "grande commission" in Paris in December. The British would love to do business with the Kremlin, but the Kremlin is particularly beastly to the British at the moment. The Germans have tried to get into the swim by offering a resumption of the talks about the no use of force agreement.

Actually, I think the West has behaved rather reasonably and has done just a minimum to repair the neglect of past years.

Mr. Allmand: I have one last question. You stated that the Czechoslovakian affair was not really an indication that the Warsaw Pact was weakening, and then you gave examples of how even now the Czechoslovakian Air Force is beginning to train, and so forth, and co-operation is being shown between Warsaw Pact countries. However, we have read and heard other statements which say that the Czechoslovakian affair was merely the first of many similar attempts at freedom from the domination of the Soviet Union and that we might see similar things in Poland, East Germany and perhaps again in Czechoslovakia—even, perhaps, in the Soviet Union.

If that point of view is correct the Warsaw Pact would seem to be weaker than you have indicated.

Dr. Sommer: Let me explain myself. I probably was not lucid enough. Mine was a strictly military argument. I was referring to the argument put forward by some people that because 14 Czech divisions cannot now be counted upon the net strength of the Warsaw Pact armies is less than it was before August 21, 1968. This is a very narrow, technical, professional argument. On a political plane I fully agree with you, of course. The invasion of Czechoslovakia was the outward manifestation of a deep insecurity and uncertainty hovering over the whole Soviet system.

• 2135

I think the Russian intervention does not represent a reversal of the decline of Soviet influence over Eastern Europe, but only a temporary postponement. I think it did not defeat, but only delayed, the dominant trends of recent years. There were three trends; first the trend towards greater national independence in Eastern Europe which will continue; second, the trend towards greater internal liberalization, at least in the economic field and third, the trend towards wider contacts with the Western world. I think these tendencies will be resumed inevitably.

Mr. Allmand: Thank you.

The Chairman: Mr. Legault?

Mr. Legault: Thank you, Mr. Chairman. Dr. Sommer, in your presentation, which I have appreciated very much, you have definitely put the point across that conditions since the origin of NATO some 20 years ago—back in 1948—have changed. Necessarily, perhaps, the conditions have changed to the extent that perhaps France miscalculated and that the *détente* was really so well established that they could pull out of it.

Would you care to give an estimate of how much longer the alliance should continue until we reach the point of this *détente* or this understanding where danger would not exist?

Dr. Sommer: I have given a lot of thought to this but I have not come up with a plausible answer. Looking at the scene in Europe and the Western world as a whole, it would

appear rather implausible that 25 years after the end of the war allied troops would still remain on the main battlefield of that war, but then what choice do we have? So long as the business is not finished I am afraid we will simply have to stay there.

I see an important difference in one thing, however. In the fifties the military structure of the alliance was an end in itself. In the sixties we have come to see that this military instrument must be put to political use. I think we were not doing so badly for some time; then came events in Czechoslovakia which had indigenous roots and were not due to anything NATO did or did not do. Now I think we simply have to sit it out and wait.

As I said, for the long run I am hopeful there will come a time when liberalization and rapport with the West on the part of the eastern European countries will not be prevented by the Russians any more. One of three things must happen. The Russians must take these changes which are afoot in eastern Europe and if you look at recent reports of the Russian intellectuals and Russian scientists, the Russian national minorities act and react and think just the same way the Czech minorities, the Czech intellectuals and the Czech writers acted two or three years ago. All the elements of an upheaval in Russia are there, too. This is the first condition: the Russians conform to the reformist strength themselves.

The second possibility is that the Russians do not conform, but that they tolerate change in their immediate glacis in eastern Europe. The third possibility is that they do not like this kind of change, but they are not strong enough to prevent it any longer and this may happen.

• 2140

Perhaps you Canadians too, but we Europeans certainly, tend to look with a rather transfixed stare at what is going on in the United States and we feel that the fabric of society is weakening there. Sometimes we doubt whether America will be at all a reliable partner in the seventies.

What we neglect is to look at Russia too, and I think in Russia society is under as much strain and stress as it is in the United States. There are some experts who feel that Soviet Russia is much more likely to break up in the seventies, even in its component

minority parts, than the United States, but this is just by way of parenthesis.

Mr. Legault: My first question necessarily was based on the fact that the original understanding was for a 20-year alliance which would be renewed, and I thought perhaps France based its action on that particular stipulation.

In your presentation you also mentioned the surprise and the quick move of the Warsaw Pact troops in invading Czechoslovakia. Yet, I doubt very much whether you or any others—and especially the people in NATO—failed to be aware of this particular move being made. If I recall correctly, for weeks prior to that invasion we could read in the newspapers about the various exercises and the concentration of troops. I have a feeling that NATO could not have done anything even if they had been told a month ahead of time that this invasion would take place, especially in Czechoslovakia. Is that not your feeling?

Dr. Sommer: Yes, sir, it is, because as a matter of fact Czechoslovakia is not a member of NATO. Some people tend to forget that. Some people argue NATO should have done something. If NATO had done anything it would have violated the ground rules in operation since 1945 and it would have let loose the nuclear holocaust.

Mr. Legault: From that do you not deduct that the surprise move was not such a surprise after all?

Dr. Sommer: It was not a tactical surprise. It was surprising only inasmuch as two years ago our military would not have thought that the Soviets could move that quickly, but when they did move that quickly we were, of course, aware of it right away, but we also knew it was not directed against us so there was nothing we could do about it.

To get back to one point you mentioned at the beginning of your second question, that NATO was originally concluded for a 20-year period and that then it had to be renewed and that General de Gaulle—this was your argument—took advantage of this.

Mr. Legault: Not necessarily took advantage; that it had reached a stage where he had miscalculated, that he felt the *détente* was strong enough for him to pull out, that no more danger existed at that particular time. This is the miscalculation that rides.

Dr. Sommer: I was going to remark on that twenty-year period. NATO does not have to be renewed; under Article XIII after twenty years every member can give twelve months' notice. I for one find this a rather unsatisfactory state of affairs. We now have an alliance on twelve months' notice. We now have the nuclear protector in this alliance, the United States, in a legal situation where they can pull out at any time they wish. I do not think this is a permanent enough basis for the alliance. I for one wish to see an extension—and if possible, even ratified by Parliament—for at least five years or so, and then it could always be renewed again. Thank you.

Mr. Legault: Thank you very much.

The Chairman: Are you finished, Mr. Legault?

Mr. Legault: Yes, thank you.

Mr. Gibson: Dr. Sommer, I would like to ask you, sir, what the effect of the French withdrawal from NATO was on the NATO countries in Europe. Was NATO taken seriously? Did it have much of an impact in Europe?

• 2145

Dr. Sommer: It did, sir. Of course, this was only one of a number of inequities which France perpetrated on the rest of her allies, so perhaps in the accumulated effect that particular effect was somewhat submerged. However, on the whole the behaviour of France shocked the rest of Western Europe and, frankly, I do not think it did France any good. I have read in some Canadian publications that Canada's withdrawal from NATO would put it in a position where it would have much wider diplomatic leeway and where it would have a much better opportunity to really play a role in the world.

In my view, after France pulled out of NATO's military organizations it did not gain one inch of diplomatic leeway. In fact, I think ever since as a diplomat de Gaulle has been on crutches. Someone said the other day, that he is like a man who is frantically pulling open one drawer after the other and then pushing it shut again to see if there is anything in it. There never is. There was not anything in China; there was not anything in Latin America; there was not anything in the Elysées Treaty with Germany—and I understand there was not much in Quebec—so I do

not think pulling out of NATO's military organizations in any way strengthened France's diplomatic position in the world.

Mr. Gibson: What is the present relationship between the people of France and Germany? That is a hard question to perhaps sum up on, but what is the spirit? We have a good working relationship with the United States, we are friendly. Is the atmosphere anything like as strained as it used to be?

Dr. Sommer: It is not. I do not mean to sound facetious.

Mr. Gibson: Neither do I, and I realize it could be interpreted that way.

Dr. Sommer: But I think that Franco-German reconciliation on a person-to-person and people-to-people basis is an accomplished fact and if anything can endanger it, then it is the activities of our respective statesmen. It is high politics that is jeopardizing it again—if it can be jeopardized at all, and personally I do not think it can. I think this so-called hereditary enmity, where Germans and Frenchmen invaded each other, burned down each other's castles and did all kinds of harm to one another, after 300 years has simply spent itself, and I really think this is the psychological basis for a durable reconciliation. As I said, if anything conjures up difficulties it is the goings-on in the higher ranges of Franco-German relations.

Mr. Gibson: Do you think there is a serious danger of France or Italy suddenly swinging into a communist state?

Dr. Sommer: My first answer would be that I never excluded this thought during the past twenty years. There is always a 25 per cent element of the electorate that votes communist.

My second answer would be that one of the effects of the Czech affair is that the spectre of communism taking over in France or Italy is much less haunting and shocking than it was some years ago. I think one effect of the Czech affair was the emergence of a third kind of communism. I call it white communism. The first communism was the red one, the second communism was the yellow one and this is the third one that is now evolving in the Latin, French and Italian communist parties.

By way of a footnote I would merely like to say that the French communist party is prob-

ably the most conservative force in the country at this time, and that it was the French communist party that saved de Gaulle last year during and after the May revolution.

Mr. Gibson: Thank you for your answers. They were very informative as far as I was concerned.

The Chairman: Mr. Buchanan.

Mr. Buchanan: Thank you, Mr. Chairman. Dr. Sommer, early in your remarks I believe you made some reference to the fact that it was not so much the number of the forces but rather the quality, and I think you made some complimentary remarks about the Canadian flyers. Later on you seemed to draw back from that position and suggested that a thinning out at this particular point in time would be premature, that you felt the *détente* had been arrested and we should not now be considering that course. I do not know if you could elaborate a bit in that area or not.

Dr. Sommer: Yes. Perhaps I did not answer the previous question very clearly. I did not consider a communist take-over in Italy and France a likely contingency at that moment. My answer about the quality of the communist party in these two countries was on a rather theoretical plane.

As to your question, I do not know how to explain myself. I said it is not so much a matter of numbers—noses, bodies—it is a question of the numbers of nations involved. Is that plausible?

Mr. Buchanan: That is right.

Dr. Sommer: At first I said that I was against thinning out...

• 2150

Mr. Buchanan: No, no; initially I got the impression that it was not numbers, it was just to have a certain force there and this was an indication of commitment.

Dr. Sommer: The commitment of Canadian and American forces.

Mr. Buchanan: The numerical quantity was not really so significant as the fact that they were in fact present. Later on, as I say, you seemed to draw back from that position and you suggested that a numerical reduction at this time would possibly not be a wise course of action. There seems to be a little bit of controversy.

Dr. Sommer: There are two things. First of all, there are some contributions by some partners which cannot very well be thinned out much more without "evanescent"—if there is such a word—completely. Second, I really think that at this moment so soon after Czechoslovakia and especially, as I indicated repeatedly, without previously arriving at a concerted allied decision, a thinning out would be wrong.

Mr. Buchanan: You feel that a reduction in our forces this time would have what you call a catalytic effect?

Dr. Sommer: I think so, yes.

Mr. Buchanan: And what effect would it have on the voice with which Canada speaks in NATO councils if we were to reduce our forces?

Dr. Sommer: This would depend upon the kind of status within or without NATO you would fall back on. If you completely leave NATO, of course you would not have a voice in any of these things. If you withdraw to a sort of Icelandic status—and no offence intended to the Icelanders, or to anyone else—I think that would diminish your voice.

Mr. Buchanan: Do I understand that you feel any reduction would bring us to this evanescent point where we are really so close to zero? Is this the implication, that to all intents and purposes any further reduction is zero?

Dr. Sommer: I would say yes as far as ground troops are concerned. I would not want to speculate on what the upper or lower limit of your air force contribution would be, should be or could be.

Mr. Buchanan: Although you complimented our flyers you made no remarks about the aircraft which they fly. I do not know a great deal about them but I understand they are relatively obsolete. Is that a fair statement or not?

Dr. Sommer: Sir, all weapons are relatively obsolete by the time they are put in operation. On the whole I think your Starfighters have a much better record than the German Starfighters. Let me also say that our record has been improving. I think they have either a nuclear role or a ground support role well into the seventies.

Mr. Buchanan: Thank you.

The Chairman: Mr. Ryan and then Mr. Prud'homme.

Mr. Ryan: Dr. Sommer, speaking about the first floor of your house of *détente*, you indicated that over the past ten years there has been a change of feeling in West Germany and there is now a disposition, which very evidently came to pass last year, to recognize a *de facto* division between East and West Germany in the fact of partition. You indicated further that the idea of reunification is substantially being put out of the minds of the German people but that it is still there as a hope. Is this the situation?

Dr. Sommer: I think that is a fair summary, yes.

Mr. Ryan: What do you think will happen in the foreseeable future in respect to actual recognition of East Germany? In your opinion will this come to pass?

• 2155

Dr. Sommer: Sir, I do not foresee formal, *de jure* recognition of East Germany by West Germany, if that is what you mean.

Mr. Ryan: Yes, that is it exactly.

Dr. Sommer: I do foresee a kind of special relationship between the two Germanies if the East Germans will have it, which comes rather close to recognition but which would still preserve one essential and fulfil one basic condition, and that is the condition that the two Germanies would not be alien to each other. There is a formula which is sometimes used by ministers of the present government; they say that West Germany and East Germany are neither inland nor outland to each other, they are neither foreign nor domestic, and I think the aim of the intellectual effort of the present government was to think up a model that would fulfil this condition but would not for the risk impede East Germany's acting on the international scene. You may be interested in learning that the Commonwealth, with its weird construction, has provided us with a couple of ideas. You do have what the lawyers I think call the *inter se* doctrine. The Commonwealth members, again, are *inter se*; they have a special relationship amongst themselves. They are not alien to each other although they are different.

• 2200

Mr. Ryan: On that point, we of course recognize the different national jurisdictions.

Dr. Sommer: Yes, sir, but you do not call them ambassadors, you call them high commissioners.

Mr. Ryan: And chanceries instead of embassies, that is right.

Dr. Sommer: Yes. This may be, you know, slicing it too finely but, in fact, people in Bonn have been thinking about establishing relations between the two Germanies and have commissioners general or something like that instead of ambassadors. This is not in any one government document but you can piece it together from many utterances by public figures and by ministers.

We have offered them talks, which is new. Formerly we would not talk with them. We would not even open their letters or answer them. Now we answer them. Then we have said we will have ad hoc negotiators whenever there is anything to talk about. Then we said we are also willing to exchange permanent representatives and call them commissioners general. We are ready to do all that as long as that somewhat mystical body, the German nation, is still considered as common to both. There have been several different suggestions on what to call it—the German Commonwealth, German Confederation, German Federation, and German Union. This is a matter for the lawyers to think up. But it presupposes the will of both sides to content themselves with half the loaf. Now we would be ready to do so. The other side is not at the moment ready to do so.

Then, in all honesty, I must say there is of course another problem. East Germany is not foreign to West Germany but it is foreign to Ghana or to Canada. So what do we do about recognition of East Germany by third countries? There is no government policy on this now. I think at the moment the answer would be, let us try to impede that. But I have heard official statements to the effect that we would help East Germany along on the international scene if they contributed to an alleviation of the situation between the two Germans internally. I can only say this: If they are ready to talk seriously there will be a lot more give on our side than public utterances indicate at this juncture.

Mr. Ryan: How would the West Berlin situation fit into this picture, Doctor?

Dr. Sommer: West Berlin, of course, is a sore spot and at the moment it is a crisis

spot, at least a potential crisis spot—through no doing of our own, by the way. We had the presidential assembly in Berlin three times already and the Soviets and the East Germans never kicked up such a fuss. The change has not been on our side but on their side. East Berlin gives the Russians and the East Germans leverage vis-à-vis West Germany. Any time they want to kick up a crisis they have the right there. But if we come to a kind of interim regulation of our affairs, that would of course have to include West Berlin. It would have to safeguard the access routes and it could establish Berlin as a kind of common meeting grounds between the two Germanys. This again, I think, is up to the future and as soon as the other side is willing to call off the cold war which they are now conducting solutions to that problem become thinkable.

Mr. Ryan: Doctor, is there any possibility of an exchange being made of both territory and population—that is, West Berlin—for say a strip along the East-West division line of

● 2205

East Germany or a block or a triangle off the Baltic coast area? Is this talked about or considered? We in Canada, if I may so, regard this—not all of us may be but I think a substantial number—arrangement made at Yalta a very foolish one, in the first place, that it should have been, if made at all, only on a temporary basis and that after a five or ten year period another look should have been taken at it. But now it is 25 years or more. And we read in the paper tonight that—I am sure it is going to disturb a few people back home here—Nixon promises to defend Berlin with U.S. lives. We are in this alliance. This means we are committed too. Does West Germany want this to go on forever?

Dr. Sommer: No, we do not. We would like to come to an agreement with the other side on neutralizing the issue at least. But I do not really see how you could simply pull out now without the whole structure crumbling around your ears. I agree with you that from an ally's point of view this was a very foolish arrangement to enter into in 1944 or 1945.

Mr. Ryan: We would like to hear the German side of it.

Dr. Sommer: In contrast to what you said, that after 25 years it is time to put an end to it, I say that since it has lasted for 25 years now this foolish arrangement, with all the commitments that have been piled on it in the meantime, has become of such tremendous symbolic value, which it does not possess intrinsically but politically, I do not see how the Americans or the British or the French and our other allies, in as much as they are tied in by dint of NATO commitments, could get out now.

In answer to your specific question, you will remember that in 1958 Khrushchev posed the very first Berlin ultimatum. In 1961 we had the crisis when the wall was built. In that period there was some academic consideration in West Germany of the possibility of just taking the whole of West Berlin, not exchanging it for a strip of territory along the border but resettling it in the Lüneberg Heide, which is kind of a big sand spot south of Hamburg, and just rebuilding a completely new city, put the people in there, thereby getting rid of the bone that is stuck in our throat. But I do not see how one could do that today.

Mr. Ryan: Why not in the first floor of this house that they talked about.

Dr. Sommer: I am glad you reminded me of that. The thing is that Berlin is not in the first floor, Berlin is on the super power floor, and I do not see how any of the super powers can divest themselves of their Berlin responsibilities without practically handing victory in the cold war to the other side. I do not see the American administration doing it. Personally, I do not wish to see the American administration doing it. I do not see the Russians doing it either. I think Berlin, simply because it hurts, because it sticks in our throat, because it wrangles, is a sore, but it may also be a spur to finally arriving at some kind of settlement. Maybe that is too optimistic a gloss that I have put on it but that is the only way of looking at it. To put my answer in a nutshell, it is uncomfortable to remain there but it is impossible to get out.

Mr. Ryan: I am sorry to have asked you those rather difficult questions, Dr. Sommer, but you have been most helpful.

● 2210

The Chairman: Dr. Sommer, may I ask you a question please. Some witnesses who have

been before the Committee have suggested that the so-called bipolarization of the world which has resulted from the NATO grouping and the Warsaw Pact grouping leads in the direction of war rather than in the direction of peace, that the increase in the number of non-aligned nations is desirable and that therefore Canada should consider this alternative. Could you comment on that suggestion. In relation to Canada, the position is somewhat different from that of the United States in that she is not a super power and different from nations of West Europe simply because she is geographically further removed from Russia. ?

Dr. Sommer: Sir, taking on your argument on an academic plane, I would say that I do not share the view that bipolarization was bad or has come to an end. I think you could make a very good case that peace during the last 20 years was preserved in all those areas where the two super powers were in immediate contact, in direct confrontation, and that peace was disturbed most often in the grey zones where the two super powers were not directly involved. So I for one feel quite happy, at least relatively happy, as long as the confrontation of the two super powers, the two nuclear powers in Germany continues to exist because I think that guarantees our security and our safety.

On the other half of your argument, I do not think that the multipolarization of the world necessarily increases our security or the chances for peace. Anyhow, as a practical matter now, getting down from the academic plane, I do not see any third powers. Militarily, I think bipolarity is here to stay with us for some time yet. Politically, there are certain multipolar ambitions and psychologically, of course, too. But I think this bipolar model of a world in which the United States and the Soviet Union confront each other will remain with us for some time to come. I do not know whether I answered your question in full.

The Chairman: You answered very well. I have a related question which again arises from some of the evidence which has been presented to this Committee. Remembering that Canada lies between the United States and the U.S.S.R., would there be in your view any point in Canada attempting to negotiate arrangements both with the United States and with the U.S.S.R. which would result in Canadian territory becoming a nuclear free

area, thus interposing a buffer between the two super powers which might make a useful contribution to peace?

Dr. Sommer: I am not really sure that it would change anything one way or the other because, of course, you could make Canada a part of the nuclear-free zone but that would not prevent other nuclear powers from shooting nuclear missiles at you any time they felt like it.

The Chairman: Would it be in the interests of the United States and the U.S.S.R. to enter into such an arrangement with Canada—restricting your comments to those two particular powers? You have given an indication that they both wish to avoid a nuclear exchange.

Dr. Sommer: Yes.

The Chairman: One possible avenue for a nuclear exchange is over Canadian territory. Would it not be in the interests of both powers then to neutralize this particular area?

Dr. Sommer: Yes, but I think your argument presupposes that the weapons they fire at each other are fired from Canadian soil. That is not the case—will not be the case. The weapons they fire at each other will be fired from their respective territories. If you are thinking of denying them the use of your air space or space space...

• 2215

The Chairman: That is what I had in mind—an agreement that they would not use it.

Dr. Sommer: Yes, an agreement not to overfly Canadian territory with their missiles. I think that is technically a rather old-fashioned idea already because they can simply send these missiles the other way around the globe, evading Canadian territory,...

The Chairman: We would be a little bit relieved if they would do that.

Dr. Sommer: ...but still getting at each other.

The Chairman: As I say, we would be relieved if they would do that.

Dr. Sommer: Yes. That would not hit you unless they installed ABM systems so designed as to destroy their respective missiles exactly above your territory. I am not

enough of a missile technician but I think the nuclear devastation, the fall-out, which for Canada is probably the most fearful, will come from an ABM system, from a defensive system, rather than from an offensive missile system.

The Chairman: Mr. Buchanan, on a supplementary.

Mr. Buchanan: Dr. Sommers, a supplementary on the first part of the Chairman's question. You spoke of the grey zone as being the area where the disturbances and difficulties had arisen over the last 20 years. You suggested that that was really putting it the other way: that the existence of NATO and the Warsaw Pact, in effect, made a saw-off there and therefore the disturbances had arisen elsewhere. It seems to me this tied in very well with Robert McNamara's remarks that to some extent this is the whole area that we have been hitting at; that it is in this grey zone that so many of these conflicts arise; and that they do not arise so much out of the military as out of the economic circumstances. Many of the folks who have been here prior to you were espousing the idea of withdrawal from NATO, the thought being that we would redirect the funds which we were currently spending in the military area into economic aid in this grey area, thereby lessening the cause of disturbances and increasing the likelihood of peace.

Now, is that a valid proposition or not?

Dr. Sommer: Again I would say I appreciate the moral impulse behind this but I doubt the practical effectiveness of such a policy. The third world—we might as well get used to this idea—is a bottomless pit. It has to go through certain stages of development which we had to go through in Europe. It took us 300 years to go through them. It probably has to go through successive stages of economic development and also through successive stages of nationalist outbursts before it settles down as we have.

I hope that by means of the acceleration effect which we notice in many historic developments in this century, it will not take them 300 years. But I have no doubt but that it will take decades and that nothing we do today or do not do today will change that very much. Anyhow one hears it argued very frequently that if we do not do something the

southern half of the world will blow up in our faces. I always ask, how is it going to blow up and how is it to get at our faces? I do not think it will. The north-south confrontation is a myth, as far as we can look ahead. They cannot get at us, to put it in very crude terms. There will be no political catastrophe resulting from the difference in living standards and development. There will be a moral catastrophe, of course, if there are many Biafras or if 50 million Indians die in a famine. That will be a moral catastrophe but it will not be a political catastrophe. And I submit to

• 2220

you the best course the big powers, and possibly the middle powers, can adopt is to look in the other direction when these things happen. If every Biafra becomes a bone of contention between the Soviet Union and the United States, we are going to have a central nuclear war between the super powers one day. They have to learn not to treat this sporadic violence, of which we must expect a great deal to happen in the last third of this century, the way the big powers in 1912, 1913 and 1914 treated the Balkan wars. They must rather treat them as the big powers in the thirties treated the Gran Chaco wars. As long as you ignore them they do not endanger the international system. They are very hurtful to those who are immediately involved in them but I think it is more important that the system as a whole remain intact. I think this is what the super powers have to learn, and possibly some of the middle powers, too.

The Chairman: Dr. Sommer, may I ask one last question. It will be very brief. Assuming for a moment that you are a Canadian, what would you say in answer to this question? Against what and against whom should Canada be defending itself?

Dr. Sommer: First of all the assumption that I might be a Canadian is a very honourable one, as you put it to me, and if ever need arises to emigrate from Europe, I will make Canada my first choice.

Some hon. Members: Hear, hear.

Dr. Sommer: I am quite serious about this. Secondly, what should or whom should Canada defend against?

Mr. MacLean: Against ourselves.

Dr. Sommer: We all have to. But apart from that I think the biggest danger to you,

as to all of us, is a direct clash between the two super powers. That clash, the way the world is shaped at this juncture, is most likely to arise out of some incident or some evil design pursued by someone in Central Europe. So I would not know the exact answer to whom you would want to defend yourself against, but I would say you have to guard against another imbroglio in Central Europe and that whatever you have in the way of wisdom or physical capacity to bring to bear on that situation is well spent.

The Chairman: Thank you very much, Dr. Sommer. Are there any further questions?

Before thanking Dr. Sommer, may I just make a few very routine announcements with regard to the trip. First, the departure time is 5.45 p.m., Saturday, March 8, 1969, from the Centre Block. Now getting into really intimate details, the trip stops will be too short and the laundry service in hotels takes too long to permit laundering en route; so guide yourselves accordingly. Top-coats should be taken, especially of the rain repellent type. For money members should obtain U.S. bills—this sounds almost *infra dig*. You must obtain U.S. bills in small denominations for purchases en route in order not to receive too much foreign currency in any one country before departure. Landing cards for Cyprus—the Clerk will hand these out to be filled in and placed inside passports to be collected before landing in Cyprus. The Clerk is anxious to know just as soon as possible the names of the members who will be coming on the trip, so would the party representatives get those names to him. The Clerk still does not have the final list of names so it is important that we get that information in very quickly. Are there any further questions of a routine nature?

Mr. Forrestall: Yes, one of detail. Perhaps the Clerk could tell me. The flight leaves on Saturday at 5.45 p.m. When does it leave Gibraltar for Cyprus?

The Chairman: Monday morning.

Mr. Forrestall: That has not changed, then?

The Chairman: No. Are there any further questions?

Mr. Gibson: Is there any baggage weight?

The Chairman: We will check on that and let you know.

Mr. MacLean: Will we get a memo on these details?

The Chairman: There are some details on that itinerary that was given to you the other day. On that subject, may I remind the members of the importance of having their passports and their vaccinations. We have not thought of any other memo but we could prepare one if necessary. Mr. Allmand.

Mr. Allmand: Mr. Forrestall said flight time was 5.45. Did you not say 5.45 leaving Centre Block, 7 o'clock flight time?

The Chairman: 5.45 leaving the Centre Block.

Mr. Allmand: And what time is flight time?

The Chairman: The flight time is 7 o'clock but you should be at Uplands by 6.15.

Are there any further questions before bringing this meeting to a close?

Dr. Sommer, as you can see, we in this Committee are all trying to learn and we are most grateful to have had tonight the benefit of your wise and your eloquent instruction. Thank you, ever so much.

The Queen's Printer, Ottawa, 1969

STANDING COMMITTEE ON EXTERNAL AFFAIRS
AND NATIONAL DEFENCE

Chairman: Mr. Ian Wahn

Vice-Chairman: Mr. Perry Ryan

and Messrs.

Allmand	Guay (<i>St. Boniface</i>)	¹ Nesbitt,
Anderson	Harkness	Nowlan
³ Asselin	Howard (<i>Okanagan</i>	Penner
Barrett	<i>Boundary</i>)	Prud'homme
Brewin	Laniel	Smith (<i>Northumberland-</i>
Buchanan	Laprise	<i>Miramichi</i>)
Cafik	Legault	Stewart (<i>Cochrane</i>)
² Carter	Lewis	⁴ Stewart (<i>Marquette</i>)
Forrestall	MacLean	Thompson (<i>Red Deer</i>)
Gibson	Marceau	Winch—(30)

(Quorum 16)

Hugh R. Stewart,
Clerk of the Committee.

Pursuant to Standing Order 65(4) (b):

¹ Mr. Nesbitt replaced Mr. Fairweather on March 3, 1969.

² Mr. Carter replaced Mr. MacDonald (*Egmont*), on March 3, 1969.

³ Mr. Asselin replaced Mr. Macquarrie on March 3, 1969.

⁴ Mr. Stewart (*Marquette*), replaced Mr. MacRae on March 3, 1969.

ORDER OF REFERENCE

House of Commons,
Monday, March 3, 1969.

Ordered,—That the Members of the Standing Committee on External Affairs and National Defence be granted leave to travel outside Canada between March eighth and March twenty-second, 1969, for the purpose of furthering their work; and that the necessary staff accompany them.

ATTEST:

ALISTAIR FRASER,
The Clerk of the House of Commons.

MINUTES OF PROCEEDINGS

TUESDAY, March 4, 1969

(48)

The Standing Committee on External Affairs and National Defence met at 11:10 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Brewin, Cafik, Carter, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, MacLean, Marceau, Nowlan, Penner, Prud'homme, Ryan, Stewart (*Marquette*), Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch (23).

Also present: Messrs. Hymmen and Fairweather, M.P.'s.

Witness: Professor J.L. Granatstein, Assistant Professor of History, York University, Downsview, Toronto, Ontario.

On motion of Mr. Gibson,

Resolved,— That the necessary staff, namely: one Committee Clerk, one Assistant Committee Clerk, one Sound Technician, one Assistant Sound Technician, two Interpreters, the Adviser to the Committee, Mr. Peter Dobell, and a baggage man, accompany the members of the Committee during their trip abroad from March 8 to March 22, 1969.

The Chairman introduced Professor Granatstein, the witness for this morning's sitting. It was agreed that Professor Granatstein's advance presentation entitled *Peacekeeping: What Future Role For Canada?* and his curriculum vitae be printed as an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix pp*)

The Committee agreed to print the following papers as appendices to this day's Minutes of Proceedings and Evidence:

Speech by the Honourable Léo Cadieux entitled *Canada's Essential Security Requirements*, delivered January 27, 1969. (*See Appendix qq*)

Speech by the Honourable Mitchell Sharp entitled *The Role of Middle Powers In A Changing World*, delivered February 20, 1969. (*See Appendix rr*)

Speech by the Honourable Sharp entitled *NATO In Canadian Perspective*, delivered March 1, 1969. (*See Appendix ss*)

Members of the Committee questioned Professor Granatstein about his views on various aspects of defence policy, and especially in relation to peacekeeping.

At the end of the questioning, the Chairman thanked the witness for his testimony.

The Committee adjourned at 12:35 p.m., until Thursday, March 6, 1969 at 11:00 a.m., when the witness will be Professor Stephen Clarkson.

Hugh R. Stewart,
Clerk of the Committee

EVIDENCE

(Recorded by Electronic Apparatus)

Tuesday, March 4, 1969.

● 1111

The Chairman: Gentlemen, perhaps we could begin. As you know, an order was passed by the House yesterday authorizing the Committee to go to Europe. At this time perhaps I could get someone to move and someone to second the necessary motion this Committee has to make in order to authorize the necessary staff to accompany the Committee. Would someone move and someone second the following motion:

That the necessary staff, namely, Mr. Peter Dobell, the Adviser to the Committee; two Committee clerks; one sound technician; one assistant sound technician; two interpreters and a baggage handler accompany the members of the Committee during their travel abroad from March 8 to March 22, 1969.

Mr. Gibson: I so move.

Mr. Brewin: Mr. Chairman, I would like to raise this point although I do not want to belabour the matter because we want to hear the witness. I understand first of all there was some suggestion that female members of the staff go as translators and clerks during this time and that it was then suggested it was inconvenient for them to go. I do not want to try to change the arrangements now but I do want to give notice that if there is any such rule, and it is applied at any future time, I will challenge it because I do not think it is a proper rule.

The Chairman: Thank you very much, Mr. Brewin.

The motion as I have read it has been moved and seconded. All in favour?

Is there any further discussion?

Mr. Fairweather: There is the matter that I mentioned. Should we deal with this now?

The Chairman: We could deal with it now or it can be the subject of a separate motion after we have investigated the question of space, Mr. Fairweather, whichever you prefer.

Mr. Fairweather: That is excellent.

The Chairman: This, at any rate, would authorize these people to go ahead and make their arrangements for travel.

Is there any further discussion?

Motion agreed to.

Mr. Stewart (Cochrane): Mr. Chairman, could you bring us up to date on the arrangements for the trip? Are we going to receive an advance for expenses, this kind of thing, and when, and are we going to have time to be able to change it into American Express money orders?

The Chairman: A memorandum is being prepared which will go around to members of the Committee giving them the details relating to the trip. With regard to expenses, the requisitions have been prepared and the cheques should be available tomorrow or Thursday morning.

Mr. Laniel: Mr. Chairman, on another point, will we know in advance the witnesses who are to appear before the Committee all through our trip? The members might have suggestions and might not be satisfied if we just listen to one side of the story.

The Chairman: Yes, every effort is being made to get both sides of any particular question. I believe we will have available for the members a list of the people we hope to see. There may be some changes as we go along, but as soon as we have a list reasonably definite we will make the names known to members of the Committee.

● 1115

Mr. Winch: Mr. Chairman from the statement you made the other evening did I understand you to suggest that it is better to carry American bills than American Express cheques? You said "bills" when you made the statement the other night.

The Chairman: I think the suggestion was that it was better to have small denominations for conversion over there, but I think either bills or travellers cheques would be all right.

Mr. Gleave: It might be wise to carry the proper booklets of negotiable American travellers cheques. I think the suggestion has been made that small denominations in American bills would be handy over there.

Mr. Winch: I think this is rather important. I checked with the bank I deal with here and they say you cannot get \$5.00 in American Express but you can get \$5.00 bills. If we are only a day or two in each place, as you can get in American bills \$1.00, \$5.00, \$10.00 and up but cannot get anything less than \$10.00 in American Express, and so as not to be left with a lot of foreign currency, it might be better to have American bills. That was my information.

Mr. Gleave: I think you are right.

The Chairman: Are there any further questions?

I think a certain number of these questions will be answered by this memorandum which will be sent around by the Clerk.

The Committee will be hearing the testimony today of Professor Jack Lawrence Granatstein of York University Toronto. Professor Granatstein's written statement: Peacekeeping; What Future Role for Canada, has already been circulated to members with some biographical detail about the author attached.

I would like the Committee to note that although the question of a peacekeeping role for Canada has arisen incidentally on previous occasions, Professor Granatstein is the only witness who has specifically been invited to testify on this subject. Professor Granatstein has attempted in his written statement to provide us with an objective assessment of the prospects of Canada's peacekeeping role.

Before proceeding with Professor Granatstein's evidence, I would like to report that with the agreement of the steering committee, I inquired whether the Secretary of State for External Affairs and the Minister of National Defence felt it desirable that they appear individually or jointly before this Committee prior to its departure for Europe. In particular, I inquired whether they thought it desirable for them to give their views on some of the criticisms of current defence policy that have been . . .

Mr. Cafik: Louder, Mr. Chairman, you cannot be heard back here.

The Chairman: In particular, I inquired whether they thought it desirable for them to give their views on some of the criticisms of current defence policy that have been put forward by witnesses appearing before this Committee. While expressing their thanks for the inquiry, both Ministers considered that their opinions were already adequately on record in the recent statements they have made.

In these circumstances, will the Committee agree that the speech by Mr. Cadieux at the Ottawa Rotary Club on January 27, and Mr. Sharp's speeches at Carleton University on February 20, and at Calgary on March 1, be attached as appendices to today's Proceedings?

Mr. Winch: Could we add Mr. Kierans' speech in Nanaimo?

The Chairman: Can we deal with these speeches? Can we agree to having these three speeches by Mr. Cadieux and Mr. Sharp appear as appendices? Now, in seriousness, Mr. Winch, is that agreed? Agreed.

Mr. Winch: Now, because Mr. Kierans is a Cabinet Minister and has been, the same as the other two Ministers, publicly making speeches outside of the House, I would like to recommend that the speech of Mr. Kierans at Nanaimo also be printed.

The Chairman: I assume there is no great objection to that. Is that agreed by members of the Committee?

Mr. Cafik: The point raised by Mr. Winch?

The Chairman: Yes.

Mr. Cafik: I certainly do not agree with it. I do not think it is a comparable situation at all. The two Ministers have responsibility, one for National Defence and the other for foreign affairs and it puts them in a completely different category.

Mr. Winch: I also believe that a Cabinet minister making a speech has responsibility too.

Mr. Cafik: Yes, now if we were in the Post Office Department, I would agree with you.

The Chairman: We do not want to get into an extended debate with regard to this speech. Do you wish to press the point, or would it be sufficient if we merely distributed copies of that speech to members?

Mr. Winch: We all have it.

Mr. Fairweather: The emperor has no clothes, Mr. Chairman.

The Chairman: Now, Professor Granatstein, would you like to make an introductory statement before the members ask you questions on the future prospects of peacekeeping for Canada?

Professor Jack Lawrence Granatstein (Assistant Professor of History, York University): Perhaps I may make a few brief remarks. Gentlemen I do not think there is any need to elaborate on the feeling of disillusionment with peacekeeping that exists in this coun-

● 1120

try today, and that has existed, in fact, since 1967. It has been as if we had put all our prestige eggs in one basket and they were all broken when the basket fell down at Suez. I can understand this, and it is in fact, hard to criticize this.

The United Nations has made precious little progress on the institutionalization of peacekeeping over the past decade and certainly it shows very little inclination to proceed with this task now. The peacemaking capability of the United Nations has never been developed, neither has its peace-enforcing capability. The point I would like to stress however, is that this does not mean we in this country should toss up our hands and say nothing can be done. This does not mean we should abandon peacekeeping, as I perhaps fear we may. We should continue, I believe, to press it forward at the United Nations and retain peacekeeping as a role for the Canadian forces.

I am afraid that if the foreign policy review, as expected—at least as I expect—resoundingly endorses the status quo with respect to NATO and NORAD, there will be a feeling that the government has to find something it can change or else it will run into charges that the review was stacked from the beginning, perhaps, or rigged, or not as sweeping as it might have been. I expect this kind of thinking is responsible for the announcement that recognition of China is going to be proceeded with and the announcement that we will consider recognition of the Vatican, too.

What bothers me is that peacekeeping perhaps might be de-emphasized greatly on the grounds it is something that can safely be sacrificed and to indicate some kind of change. Certainly, the statement made by the Prime Minister before, during and since the last election campaign have given some support to this feeling. I think it would be a mistake for us to de-emphasize peacekeeping. The kind of force structure and the kind of force deployment I think we should have would be ideal for peacekeeping as well as other tasks, ideal for peacekeeping when and if required.

It would be ideal as well for a different type of role for us in NATO. Perhaps I should say that my feelings about NATO are somewhat ambivalent. Ideally, I believe we should be out but practically I think I recognize it is pretty unlikely that we will be. Certainly in view of this morning's paper it seems even more unlikely that we will be.

What we do need is a force that is smaller, a force that is more mobile, a force that is located in the NATO reserve, and possibly in Canada. We need to scrap our expensive and essentially wasteful role and the essentially militarily useless role that we now fill in NATO. There is nothing sacrosanct in the mechanized

brigade, there is nothing sacrosanct in a strike reconnaissance role. What we have to do, I think is develop a force for NATO based at home with a structure compatible with the rest of our forces. By this I mean not having CF104's in Europe and different kinds of aeroplanes here; not having heavy tanks in Europe and different equipment here. This would save on retraining cost, it would save on conversion training, it would save on personnel, and I think it would provide money within the present budget so we could invest in equipment. God knows we need equipment in the Canadian Forces pretty badly. It would be criminal perhaps to send the Canadian brigade in Europe into battle driving their 1940 vintage tanks.

This kind of adaptation of our role would give us more useful part to play in NATO. It would also give us the force able, and I hope willing, to respond to peacekeeping requests in a positive and effective way whenever, and if, they should be raised. That is all, Mr. Chairman.

The Chairman: Thank you very much, Professor Granatstein. Questions? Mr. Brewin?

Mr. Brewin: Professor Granatstein, I wonder if you would elaborate on your paper by dealing with actual situations in which you thought peacekeeping forces might be used. In Viet Nam, for example, if the long negotiations there result in any sort of settlement, would you anticipate that the peacekeeping forces

● 1125

would have to be enlarged to police a settlement in that area?

Professor Granatstein: Yes, I think they probably would. It is difficult to foresee just what kind of forces might be required there. They would almost certainly have to be very large. They would almost certainly have to have some kind of mobile capability. In other words, the present ICC would have to be expanded in some fairly large way, and given a pretty broad mandate in order to tackle this kind of job.

Mr. Brewin: I think there was an article in the January issue of Foreign Affairs in which Dr. Kissinger suggested that very thing in discussing the future of negotiations in Viet Nam?

Professor Granatstein: If there were something in Viet Nam it is probably a lead pipe cinch that we will be involved in it simply because we are already on the ICC.

Mr. Brewin: Let us take another situation where there is conflict, the Middle East. True, the withdrawal of UNEF, as you say, had some traumatic effect on the weak-minded, at any rate, and directly lead, perhaps, to the outbreak of hostilities. However, supposing Dr. Jarring is successful, would you think some

renewal of some peacekeeping effort would be required in that area?

Professor Granatstein: I think probably some renewal would be required. However, I think it is probably doubtful that we would be asked to serve on it. I think in some ways we are *persona non grata* at least with the Egyptians at the present moment. I think it rather unlikely that we would be asked to participate in a force there. But, that there is likely to be a force there is, I think, very probable.

Mr. Brewin: I may be wrong but I think this Committee has suggested that in the event of any truce being arrived at by negotiation in Nigeria between the Federal Forces and the Biafrans, almost certainly it would require some sort of peacekeeping force there. Do you agree with that?

Professor Granatstein: Yes.

Mr. Brewin: Although I suggested three cases to you where there might be peacekeeping forces, I suppose the very essence of the problem is that the conflicts spring up suddenly and unexpectedly and some outside intervention may be able to limit the spread of hostilities. Is this not the basic notion of a peacekeeping force?

Professor Granatstein: Yes, I think so. There was no real forewarning in the Congo in 1960 that a peacekeeping force would be required there. Yet, within a month or so of the independence of the Congo there were upwards of 20,000 men serving in the UN peacekeeping force there.

Mr. Brewin: I remember reading the statement that since the end of the last war in 1945 there had been 80 conflicts in the world in which regular forces had been employed. Do you anticipate that there will be a continuation of instability which will lead to these?

Professor Granatstein: Yes, sir.

Mr. Brewin: Is it your view that peacekeeping forces would be perhaps essential to limit conflicts in those areas?

Professor Granatstein: Yes, sir.

Mr. Brewin: That is what you might call a leading question.

Professor Granatstein: Yes, sir.

Mr. Brewin: That is all, thank you.

Mr. Gibson: Sir, on page 6 you have stated that the Commando Regiment, for example, will be capable of operating anywhere on short notice. Would you mind

elaborating on what you mean by a Commando Regiment? Could you amplify this a little bit?

Professor Granatstein: Well, there is a unit of the Canadian Forces that is now officially called Commando. It is based half in the West and half in the East, as I recall, and it is being brought up to strength at the present time. I understand its role is, in fact, to act as a commando force able to operate in various places, over various types of terrain, on short notice.

Mr. Gibson: This concept particularly appeals to me as being a worthwhile type of force for Canada to have, sir. In another place in your brief I think you suggested we should have mobile troops with airlift support. Would you advocate such a force in Europe?

• 1130

Professor Granatstein: If we were going to have this kind of force, I would prefer to see it here. However, if for various reasons this is impossible, it would certainly be better to have an air mobile force in Europe than the present force structure we have there.

Mr. Gibson: Some of the witnesses have expressed a view that invasion of Canada is relatively unlikely and that if we were needed to quell some raid or outbreak of violence it would be far more likely to occur in Europe. Would you disagree with that?

Professor Granatstein: I find it very difficult to think in terms of limited war situations in Europe.

Mr. Gibson: Do you not think it is possible, say, if there were a revolt in France—a communist uprising—that there might be cause to send a commando force to some port or some vital area that is under attack?

Professor Granatstein: No, sir, I do not.

Mr. Gibson: Are you thinking in terms of Europe? I am not trying to be little you, sir; I have read your qualifications and anyone who has read them will realize how qualified you are. Do you not think it is more likely that the type of trouble our NATO troops are likely to run into would be in the form of some type of commando raid from the east, or some insurrection or riot of some violent type, a threat on, say government, buildings somewhere or something like that? Is that not the type of situation that might come about?

Professor Granatstein: I cannot conceive of the Canadian government's committing its forces to put down an insurrection within a NATO country. That to my mind is absolutely inconceivable. The prospect of a raid I think, is almost equally inconceivable.

Mr. Gibson: I do not know really why you prefer keeping this commando force in Canada as opposed to

Europe. If there is less likelihood of their use in Canada, why keep them here when they have to be moved around to get to the scene of the outbreak?

Professor Granatstein: In the first place you would save on gold outflow, and so on. It would mean that we would not have this long pipe line that forces us to keep shuttling people back and forth across the Atlantic which is inconvenient, wasteful and advances nothing. We can train just as well in Canada for a NATO reserve role as we can in Europe. I am not ruling out the possibility, as I think General Foulkes suggested to this Committee, of having a sort of six month term for a force operating in Europe. I think that kind of thing is eminently practical.

Mr. Gibson: You touched on the problem—and I think it is a very significant one—of the use of heavy armour and Canada having outdated tanks. Is it your opinion that the German tank is superior to almost any other tank in the world, the type of armour that the German army has?

Professor Granatstein: That is a jointly-developed project with the United States, I think. I really could not comment on that kind of question.

Mr. Gibson: Do you think if we kept out of the tank area that our force would be more flexible, that the peacekeeping aspect would be more practical than if we commit our resources to the tank area?

Professor Granatstein: There is no question that we would be more flexible. Tanks are very heavy and difficult to move around. You would have good tactical mobility, but very poor strategic mobility. I would like to see us increase the strategic mobility.

Mr. Gibson: What say does Canada have in the use of the forces that are committed to NATO? Once they are committed, do they not come under NATO generals jurisdiction and are more or less told to perform whatever role NATO wants them to perform? Can the Canadian government say: "We are going to give you this and you can use it if you want it. If you do not want it, that is all we will give you."

Professor Granatstein: I understand that is a question for negotiation. All I am suggesting is that we, in fact, negotiate ourselves into a different role.

Mr. Gibson: On the question of tanks you should . . .

Professor Granatstein: No, on the question of whether you are in a front line role, or whether you are in a reserve role. If you are in a reserve role in an air mobile position, then I think that kind of deployment does not require tanks. The Canadian government decides whether it is going to have tanks or not. It is

up to us and NATO to decide the kind of role we are going to fill.

Mr. Gibson: Thank you; that is all.

The Chairman: Mr. Allmand?

Mr. Allmand: Dr. Granatstein, have you considered the possibility of a UN peacekeeping force recruited directly from the peoples of the world rather than made up of national contingents? The United Nations in all other areas recruits its servants and officials directly and it seems to work very well. Many people have suggested that it should recruit its peacekeeping

● 1135

force in the same way, because this would eliminate the criticisms that national contingents are involved with vested interests, and so forth. What analysis have you made of this proposal and what do you think of it as a possibility for Canadian initiative?

Professor Granatstein: I really do not think it is feasible. That kind of thing has been tried. It was talked about in the immediate post-war years and the UN thought in terms of doing this kind of thing and never got anywhere. The closest they came to it was when they set up the UN field observer service—I believe it is called—which, in effect, is a kind of UN communication service made up of nationals directly recruited. I think it would be very difficult to pay for it, recruit it, get permission from the countries involved and decide how to use it. I think there are enormous factors that would come into play there that would probably rule out this kind of thing.

Mr. Allmand: In other words, you feel the national policies of the various states would interfere with the formation of such a force.

Professor Granatstein: I think so, in part.

Mr. Allmand: But do you not feel if we are going to make any real breakthrough in peacekeeping, or in putting the United Nations in a more effective position to deal with international disorders and so forth, that this is the type of thing that will have to be done?

Professor Granatstein: Not really, sir. I think the breakthrough should come in the sense of institutionalizing peacekeeping in a way that we have never managed to do up to now; getting a planning staff at UN headquarters; getting commitments from countries to have standby forces; getting a standard operating procedure worked out that is understood and having people you know you can draw on for certain or countries you know you can draw on for certain contributions. If we get that it would be enough of a breakthrough and that, I think, is more feasible than the case you are suggesting.

Mr. Allmand: Thank you.

● 1140

The Chairman: Mr. Forrestall?

Mr. Forrestall: Mr. Allmand has touched on one area that I was concerned with and I have a supplementary, just a matter of clarification, Dr. Granatstein. You feel, then, that the reasons why the United Nations would not be likely, in the immediate or foreseeable future, to move in this direction are very much the same reasons that they had to face up to some years ago when they quietly shelved any concept of direct recruitment for such a team. In other words the reasons are the same today as they were 10 years ago.

Professor Granatstein: Yes, it is more like 20 years ago.

Mr. Forrestall: In your written presentation, Dr. Granatstein, you suggested that we should make peacekeeping our *raison d'être*...

Professor Granatstein: In its broadest sense.

Mr. Forrestall: —in the broadest sense and that would effect a reduction of some 15,000 to 20,000 personnel and a huge saving in the contributory costs of maintaining them.

From where would you see these upwards of 20,000 men being cut?

Professor Granatstein: By scrapping the brigade in Europe and not replacing it when you bring it back; by cutting out the CF-104 contribution and not replacing it; in fact, recognizing the fact that if you are going to carry out any kind of role you have to have the money to do it and if the budget is not going to be raised the only place you can get the money to get any equipment is, in fact, by cutting men, because your personnel costs are the most expensive costs.

At the present time, with this country's defence policy, we are going to have to cut 20,000 men in order to buy any equipment at all. What I am suggesting here briefly, I think, would be one way of doing this cut and finding a new role for the forces we have left.

Mr. Forrestall: What would you see the role of the Maritime Command being—and I must be mundane about this—in this broad general concept that you have expressed?

Professor Granatstein: This is a can of worms of sheer interest to Halifax I am sure. I think Maritime Command is a fat cat that could be cut in half or done away with.

Mr. Forrestall: I suppose I asked for that. I do not doubt your sincerity in saying it. However, at another time I must take issue with you about that. I have one other detail question and you may have an equally forceful reply to it. Do you see any continuing value of our new CF-5 in connection with this highly mobile force? Do you think it would play a useful role?

Professor Granatstein: Well, it had better or else we have paid a lot of money for something that is not much good. In the sort of broadest concept of peacekeeping it can play a role in mobile forces. It means you have a force equipped with its own air support, presumably able to operate off more or less rough airfields. I think that is something a mobile force should have.

Mr. Forrestall: Fine; that is all I have to ask.

The Chairman: Mr. Cafik?

Mr. Cafik: Dr. Granatstein, you make a couple of interesting observations on pages 4 and 5 in your written presentation about Nasser's objecting to Canadian troops because of our at least ceremonial alignment with England in having the same Queen. You speak later on of the unfortunate incident of calling the troops we sent over there the Queen's Own Rifles. This raises a whole basic question in my view. Do you feel that our alignment with England, in the sense that we have the same Queen, is a deterrent to any peacekeeping operations?

Professor Granatstein: Not really, no. I think President Nasser was looking for an excuse to put obstacles in our way in 1956 and the fact that the forces were called the Queen's Own Rifles, in fact, gave him this excuse. But on the other hand, it is a practical consideration. The forces are wearing Queen's Own Rifles on their shoulder patches. The British forces that came in may have been the Queen's Own Cameronians or something like that, some British regiment. The possibilities of a genuine misunderstanding, I think, are evident. But to say this is a deterrent is probably not fair.

Mr. Cafik: As Great Britain was one of the great colonial powers in Asia and Africa and other countries which are now emerging with their independence, and as it appears to me that most of our possible peacekeeping operations will be in those areas in the future, do you not feel that this might be a genuine problem?

Professor Granatstein: I think we have established our bona fides with most of the African and Asian states and I do not see that this is a real problem.

Mr. Cafik: All right. Now, you point out that our being a NATO member in some cases works as an advantage to our getting a peacekeeping role and sometimes to a disadvantage, but in either case we normally end up on the force. This is quite different from what many other witnesses indicated. Many thought that by withdrawing from NATO and NORAD our potential in terms of peacekeeping and working with underdeveloped nations would be greatly increased. You do not really share that view I gather, or do you?

Professor Granatstein: In some ways I do. Most of the people who made that case to this Committee are people who I think would share the same kind of outlook on most of the questions that I do. But in some respects I disagree, just on the basis of experience. Up to now you cannot say that this has interfered in any way. You cannot say that it has helped greatly, that their being there is a factor.

Now, no one knows what future events are going to bring. The point I tried to make is that our military capabilities are the major factor that got us on all these peacekeeping forces. There may be a time when there will be other countries with the same capacities. In that case I would think then a nonaligned nation would be more likely to be a desirable member than Canada.

Mr. Cafik: On page 7 you mention—and this was pursued earlier—our having a mobile peacekeeping force that could be airborne quickly. Do you not think that to create such a force would increase the cost of our defence commitment?

Professor Granatstein: If the present personnel level is maintained, yes, it would. But if, in fact,

● 1145

you cut back by about 20,000 to a level of say 80,000 men, then I think a substantial amount of the budget would be free for equipment.

Mr. Cafik: Do you have any idea of the capital cost of making such a change?

Professor Granatstein: Not really, no.

Mr. Cafik: So you think it would be fairly considerable?

Professor Granatstein: Oh, yes, without question. The cost of helicopters, for example, that an air mobile force would have to have run, I understand, for the stripped down version, in the order of \$500,000. If you get C-5 transports, these huge American troop carriers that are now in production, their cost runs at something like \$20 million a plane. There is no question that the expenses are going to be huge. But the point is that if we stay as we are

now, keeping the same role, we are going to have to re-equip the brigade at any rate at huge expense. Tanks are pretty expensive as well.

Mr. Cafik: That is fine. Thank you, very much.

Mr. Laniel: Dr. Granatstein, while many of my points have been put by others, you say there is little likelihood that the United Nations will make arrangements for standby forces, and yet you want Canada to go into that field. If we look back we have to realize that at least the big powers have vetoed most of the forces at the time they were suggested and everyone seems to agree to them as a last resort when nothing else works. How would you really justify a role—a general permanent role for the Canadian Forces in that field of peacekeeping?

Professor Granatstein: I do not think the great powers have vetoed most of the forces and even if they should it would not make any difference because, in fact, under the Uniting for Peace resolution that was passed in 1951, the General Assembly, where there is no veto, can set up a peacekeeping force. In fact, the UNEF was set up by the General Assembly in Suez in 1956 so I do not see that as a problem.

I grant there will be difficulties because it is unlikely that the United Nations will, as I said be able to make real arrangements for standby forces. However I am not suggesting that our only policy should be peacekeeping. I did not say that at all. I am just suggesting that we should keep on pressing for peacekeeping forces, that we should keep pressing the United Nations to make arrangements, that we should be willing and able to serve on peacekeeping forces if the need arises and that this should stay as part of our policy. I am not saying that if the United Nations does not do something tomorrow, therefore, there will be no more peacekeeping. What I would suggest is that crises are going to arise—are almost certain to arise—where the need for a peacekeeping force will come up and then, I think, it would benefit us to be in position to act in such a case.

Mr. Laniel: But you said that Canada would not be too acceptable by the Egyptians in Asia or in Africa and these are the parts of the world where there might be trouble.

Professor Granatstein: I did not say that, sir. I said we might not be too acceptable to the Egyptians, but I have said—I tried to make the point—that we would be acceptable in Asia and Africa as a whole, simply because we are one of the few countries that is capable—militarily capable—of carrying out this kind of role. That is the significant factor. In fact, if we were black, we would be in better shape to do this kind of thing, but we are not. However, we do have the technology, technical skills and so on that

would let us fill this role. I think that is a significant factor.

Mr. Laniel: Apart from the fact that we are a member of certain alliances, it prevents us money-wise from doing more in the field of peacekeeping. Do you not think that there is an advantage—maybe you partly answered that in your reply to Mr. Cafik's question—in being a member of an alliance such as NATO whereby some of the smaller or unsecured nations see our presence there as some kind of security or reassurance?

Professor Granatstein: Which smaller and unsecured nations?

Mr. Laniel: The South American nations.

Professor Granatstein: They are reassured because Canada is in NATO? How?

Mr. Laniel: Because of the fact that our presence in NATO might make the alliance more reasonable and willing to take greater steps in solving a problem and preventing a world massacre.

Professor Granatstein: You would have to convince me that, in fact, our influence has been used successfully in that way and I would be very interested in having you try, sir.

Mr. Laniel: No, these are just thoughts that have come to my mind, too. You have not said too much about NORAD. How do you see Canada in relation to NORAD even if we do give priority to some kind of peacekeeping role?

Professor Granatstein: I think NORAD is an even bigger milch cow than Maritime Command. I do not see why we should be pouring all this stuff into NORAD in an attempt to stop bombers that are, I suspect, a non-existent or virtually a non-existent threat. It certainly would be absolute nonsense for us to put any money in anti-ballistic missiles.

Mr. Laniel: How do you see the role of Canada in its own defence or in the defence of North America?

• 1150

Professor Granatstein: I do not see the defence of North America as a real problem. We are, in effect, defended against everybody except the Americans and there is no defence against the Americans, anyhow.

Mr. Laniel: What do you think the reaction of the population of Canada would be if we were to maintain our present defence expenditure just to send our Armed Forces abroad to defend other people, particu-

larly when they are being told by people like you that there is nothing to worry about in Canada?

Professor Granatstein: Who is the enemy in Canada? We have been using all the money in our defence budget to train our forces to send them abroad and the Canadian people have not objected. According to the Gallup poll they seem to be in favour of our continued participation in alliances, so they are not objecting now and I do not see that anything would change.

Mr. Laniel: Thank you.

The Chairman: Mr. Howard?

Mr. Howard (Okanagan-Boundary): Mr. Chairman, Mr. Cafik touched on the topic that I was most interested in and that is this problem of change-over—the problem of cost—if we start into a new role. It has been suggested that a peacekeeping role would be cheaper for Canada and yet all our equipment has been designed for a different type of role. We have geared up to this. Our aircraft carrier, for example, has just been refitted at great expense even though it is considered to be half-way through its life span. This is typical of many of the pieces of equipment we have. They were designed for a role in Europe and the equipment is not necessarily worn out in all cases. Much of the equipment is quite new. Therefore, if we are going to change our role into a peacekeeping one, the equipment that we have will require a complete refurbishing. This is not only a cost problem, but it is also a time problem because we are talking about a matter of years, probably, before we could be effective in such a role. So we are looking at a political situation perhaps five years from now, at the least; we are looking at a period between 1975 and 1985, say. Would you agree then that we are locked into our present position if we agree to stay in NATO at all because of the equipment that we have available at the present time? If we followed your suggested policy that we are really talking about a period starting at least five years from now what is your prognostication of the political situation that we would be dealing with at that time?

Professor Granatstein: I cannot foresee anything in the future, obviously, but I do not think we are locked in. I think you can change gradually and I think you can adapt to a new role. I think it is going to take 10 years to re-equip the forces whether they are operating a mechanized brigade in NATO or whether they are playing an air mobile role. It is going to take 10 years to buy all the equipment because it is going to cost a couple of billion dollars and there is no way we could do this in one lump sum payment; it will have to be spread out perhaps in \$200 million dollops over 10 years. Without question, it is going to take a long time, but the important thing is to renegotiate our role while we can—while the opportunity is with us, this

year, next month—and to change our role, if that is what we want. Let us, for God's sake, know what we are going to do now so we will not find ourselves stuck in the mud in the status quo that was very relevant in 1951, but is, perhaps, not so relevant now.

Mr. Howard (Okanagan-Boundary): Are you suggesting that in the meantime we also should be selling the world on the idea that Canada is an independent peacekeeper and not a full-fledged NATO partner?

Professor Granatstein: I did not suggest that; I did not say we should get out of NATO. I said that we should change our role in NATO so that it will be compatible with a different kind of position for us, with greater emphasis on peacekeeping. That is all I suggested. I would like to see, say, our role as one of peacekeeping in NATO and out of NATO as well.

Mr. Laniel: Could I ask a supplementary, Mr. Chairman?

The Chairman: Yes.

Mr. Laniel: Professor, although you did not suggest that we should withdraw from NATO, do you feel if we did withdraw from NATO that it might weaken NATO to the point where other countries might also withdraw?

Professor Granatstein: No sir, because if the other countries withdrew because Canada withdraws then presumably the purpose of the alliance is ended.

Mr. Laniel: Thank you.

Mr. Howard (Okanagan Boundary): That is all I have; that was my last question.

The Chairman: Mr. Ryan and then Mr. MacLean.

Mr. Ryan: Professor Granatstein, you indicated that Canada could save a lot of money by doing away with Air Transport Command.

Professor Granatstein: I did not say that, sir.

Mr. Ryan: Well, that was the impression I got. You would continue it then?

Professor Granatstein: If we are going to play this kind of peacekeeping role, Air Transport Command has to be expanded.

Mr. Ryan: Yes, and you would replace the Yukons with possibly C-5's?

Professor Granatstein: I think we need a couple of C-5's. We need an aircraft that is capable of performing many roles. A C-5, because of its very size, cannot land everywhere, and, therefore we will need other . . .

Mr. Ryan: I am sorry, I misheard you. I was going to point out that the present Air Transport Command is servicing peacekeeping operations pretty thoroughly as well as servicing the brigade and the Air Division in Europe. In fact, we almost have an international airline with regular schedules and sometimes its missions go right around the world.

● 1155

Professor Granatstein: There is no question about that. I think Air Transport Command has played an extraordinarily useful role in any number of peacekeeping operations.

Mr. Ryan: So that is one thing you regard as essential to keep?

Professor Granatstein: Oh, absolutely.

Mr. Ryan: Yes, thank you.

The Chairman: Mr. MacLean?

Mr. MacLean: In this whole concept of peacekeeping, their use obviously would be limited to the break out of violence between rather small countries on the whole. I mean there would be no suggestion of sending Canadian peacekeeping force off to Mongolia or somewhere at the present time because the Chinese and Russians are reportedly feuding and it would be limited, I presume, to what is sometimes referred to as the third force in the world, the emerging nations? We had a witness, Dr. Sommer, who expressed the opinion that the attempts of the third world force to solve its problems will probably be the most frustrating and thankless operation that the larger countries of the world will be faced with in the near future or in quite a period of time to come. Taking a perfectly cynical view, why should Canada be so eager, as you suggest it should be, to rush into this kind of a thankless operation?

Professor Granatstein: There is no question that it is going to be thankless; there is no question that our troops are going to get clubbed and beaten and probably shot in some instances, but if you say that the purpose of our forces is, in fact, to preserve peace, to not fight, to not get involved in a general war, then I can think of nothing that is really more truly useful for Canadians and for other countries than to do this kind of thing—to stop small conflicts from blowing up into big ones; to stop brushfire wars from turning to world-wide conflagrations. This is something we really want and, I think, it would be a more useful role for us. It would be something that would make peace more likely than just stationing troops on the East German border as we are doing now. Perhaps the real threat is more likely to come from some smaller conflict than out of the East.

Mr. MacLean: Again from a cynical point of view, could it not be argued that if the larger countries and those associated with them in the east and west blocs, if you want to call them that, were to ignore completely these minor wars in the third world force they would never grow into world conflagrations?

Professor Granatstein: Except that they have not completely ignored them up until now and it is most unlikely that they will completely ignore them in the future. You cannot tell me that the Middle East situation, for example, has been completely ignored by the great powers or the Congo.

Mr. MacLean: I know this has been the case up until the present time, but maybe this is a trend that should be encouraged rather than . . .

Professor Granatstein: I would suggest that the best way of persuading the great powers to keep their paws out would be by having the United Nations presence at these small conflicts.

Mr. MacLean: Is this not going to be an endless task, again from a rather cynical point of view?

Professor Granatstein: Yes, sir.

Mr. MacLean: I do not think you can impose a highly ethical civilization on people who are always at each other's throats. Possibly it is an insoluble problem and unless you impose a kind of a peace by the UN by force which is—especially the peacekeeping forces that are going to be made up chiefly of whites is something fairly close to colonial peace, *pax Britannica*.

Professor Granatstein: Certainly many people have raised the point, in fact, that this will not solve anything. You just will be imposing a new kind of colonialism on the underdeveloped nation and in some ways, I suppose, that is true. You are insisting on applying sort of western concepts of order to a part of the world where perhaps this concept is foreign. This may be one area where, in fact, our western concepts are perhaps rather better than the existing ones and I would certainly say this is one area where we should persist in this kind of role. I think it is a noble role and I think it is a useful role. It is noble; it is idealistic; it is practical. It seems to combine in one package any number of things that make it attractive, at least to me. I grant that it is going to be tiresome, tedious and never ending.

● 1200

Mr. MacLean: But human nature is very perverse. In a situation of that sort you would assume that at some time the people who are being kept at peace would become resigned to that sort of situation, but

I have my doubts. This thing may fail in the end in the same way as colonialism failed, in spite of the many advantages it brought to large areas of the world.

Professor Granatstein: I grant that, sir. It may fail in the end, but the trouble is that if it does fail it can kill us all in the process and that is something I am not prepared to risk.

Mr. MacLean: I would not necessarily agree with you there, although it could be a very painful and agonizing process. Maybe the fact of the situation is that the third world areas will have to evolve slowly from their own experience, as Europe did over the last couple of thousand years, to find out that constant warfare among themselves is not a profitable way to live and to . . .

Professor Granatstein: To a condition where we have only big wars?

Mr. MacLean: Yes, exactly.

Professor Granatstein: Real progress.

Mr. MacLean: It is very hard to diagnose but with the nuclear stand-off over the past number of years it would seem that maybe we have reached the point where even we recognize the human . . .

Professor Granatstein: If I follow your logic, sir, then we should give all the small countries nuclear arms so that they will be in the same condition of nuclear stand-off.

Mr. MacLean: No, but they might reach that point eventually.

Professor Granatstein: Then we will be in real trouble.

Mr. MacLean: Then they would evolve much in much the same way as Europe has or if you think that is utterly bad, maybe we should have some peacekeeping forces from older civilizations like China impose their sort of peace on Europe.

Professor Granatstein: I do not know how to comment on that. I am sorry.

The Chairman: Have you finished, Mr. MacLean?

Mr. MacLean: I am finished, thank you.

The Chairman: Mr. Hymmen.

Mr. Hymmen: Mr. Chairman, I noticed that Dr. Granatstein recommends the role of peacekeeping for Canada and I certainly agree with the idea, of course.

We have served an important role in various countries of the world. This was an important recommendation in the White Paper and also was one of the reasons for unification.

I have some questions as other members of the Committee have had in regard to the inference that there could be a large reduction in personnel. So that this will not be taken entirely out of context, I noticed in the sentence following this on the last page of your brief that the saving—the financial saving—in less personnel could be invested in equipment. In other words, you recommend the status quo as far as the defence budget is concerned or do you recommend an increased defence budget? What is your view?

● 1205

Professor Granatstein: I would like to see it cut as much as possible, but I do not think that is entirely feasible. The one thing I really think is certain is that if it is raised, if we ever get this 3 per cent GNP, there is going to be an enormous outcry from pretty large segments of public opinion. If you assume that the budget is fixed and if you assume that forces have to have equipment, then there is only one solution and that, in fact is to reduce our present strength by about 20,000 men. We are locked into a financial straitjacket at the moment and there is no way we can get out of it as long as inflation continues and as long as a fixed dollar sum is allotted for defence as it virtually is now.

There is just no way we can have a 100,000 man force filling the same kind of roles we are at present. I just do not think it is possible, at least, if they are going to have any equipment.

Mr. Hymmen: We know and we have been told so many times that in the event of a major conflagration Canada could not hope to defend itself without the help of the United States. You are suggesting that we should have a defense force of 80,000 men in order to provide for any emergencies on our own shores and also to provide peacekeeping forces in other parts of the world. Do you think this is realistic?

Professor Granatstein: Do you think it is realistic to talk of defending Canada with 100,000 man force? Is it any less realistic to do it with an 80,000 man force?

Mr. Hymmen: It has been suggested, as I said earlier, that since we have no way of defending our shores anyway, why have any armed forces? Why not just call on the United States of America to bail us out?

Professor Granatstein: You have armed forces for purposes that I am sure Professor Eayrs talked to you about and put in his brief to this committee. You have them for prestige purposes, for diplomatic purposes, for military purposes, for ceremonial purposes and any number of purposes. He maintains that the role of our forces, in fact, up until now has been largely ceremonial.

I am suggesting that we might be able to find a role that is perhaps a little more practical in which the defence of Canada was not a consideration. In the first place, I do not see an enemy who might attack us and in the second place it would be impossible for us to defend our country anyhow unless we had a massive force. I think this is unarguable. The purpose of our forces then would be to carry out our policies abroad. The question is, what kind of policies? Up to now they have been sort of the NATO, NORAD kind of thing. I am suggesting, perhaps, there should be modifications in that kind of role.

Mr. Hymmen: There is another reason for having an armed force as I think other people have suggested, even the Prime Minister that there could be a spill over of civil disorders from the United States. I am getting back to the question of what is the idealistic amount of forces to have in this country considering its tremendous size and a population of 20 million people and I suggest if you get down to a force of 80,000, 50,000, 25,000 it may be more of a farce then it is now.

Professor Granatstein: I do not think it is a farce now. I did not suggest that. I do not think in the event of a spill over of violence from the United States into Canada it would require heavy tanks and strafing planes. It would require, in effect, people who were trained for precisely the kind of role that peacekeepers are trained for, crowd control and riot control with a mobile capacity.

Mr. Hymmen: I was not talking about equipment. I was talking about personnel and this whole question of what is a realistic force.

Professor Granatstein: Is 80,000 any less realistic than 100,000? If you tell me that you have to have 10,000 in each province, why quibble? Why not get us a role—find us roles—and then start worrying about the number of people?

Mr. Hymmen: I have one other question. You suggested that NORAD was in the same category as the Atlantic command and you used the words, a "milch cow". Is not our role in NORAD essentially one of planning and liaison?

Professor Granatstein: We seem to have put something in the order of \$150 million a year into this thing which is a very high price to pay for planning and liaison.

Mr. Hymmen: If we do not renew the NORAD agreement or cancelled the NORAD agreement what other arrangement could we have with our neighbours to the south?

Professor Granatstein: What is the purpose of the agreement? It is to shoot down bombers. Is there a credible threat and what is this NORAD agreement going to mean with respect to our getting involved in ABM's? These are the questions that should be asked. It is not enough to say when they renew the agreement that we are not going to get involved in

● 1210

ABM's. When the Americans put them up in Buffalo and at Plattsburg we are going to get involved because the Canadian people are going to say, do we want these things dropping on our heads? Do we want the fallout dropping on us? They are going to say, no, we do not want this, put them up in North Bay and they will drop on the Eskimos.

Mr. Hymmen: But whether we are in NORAD or out of NORAD, is that going to have any effect on whether the United States installs ABM's in Buffalo or Detroit and is that going to affect our situation?

Professor Granatstein: The United States is going to protect itself as it sees fit. There is no question of that. We have already sort of said, we do not want to get involved in ABM's, but by virtue of being involved in NORAD we are already involved in ABM's. I think Mr. John Gellner who was a witness before this Committee demonstrated this very clearly in a number of columns last year. We are already involved. The purpose of NORAD is to stop the Soviet bomber threat. Is this a credible threat?

Mr. Hymmen: It is still a threat, is it not?

Professor Granatstein: Is it? In the face of ICBM's, when the Soviets have as many ICBM's or almost as many as the Americans are you going to say that 150 bombers constitute a threat that would justify the expenditure of \$150 million by this country?

Mr. Hymmen: Thank you.

The Chairman: Mr. MacLean.

Mr. MacLean: Might I ask a supplementary. Is it correct to say that NORAD is concerned only with bombers? Surely it has a role—it may be a minor one—in the question of surveillance, identification and maintenance of our sovereignty, jointly with the United States over our air space?

Professor Granatstein: Yes, I would grant that.

The Chairman: I have Mr. Ralph Stewart and then Mr. Harkness.

Mr. Stewart (Cochrane): Thank you, Mr. Chairman. I have just a couple of little questions for clarification purposes. Incidentally I would object strongly to anything being placed at North Bay which is going to wipe out my riding.

Professor Granatstein: So would I sir, so would I.

Mr. Stewart (Cochrane): You said a while ago, Dr. Granatstein, that our relations with Egypt were not good. As a matter of fact, I think you used the words that we were person non grata.

Professor Granatstein: We were in 1967, anyhow.

Mr. Stewart (Cochrane): We are not any longer? I would like you to explain that. I do not understand that.

Professor Granatstein: When UNEF was kicked out, which is not too strong a word for what happened of Egypt in 1967 the Canadians were particularly singled out and in effect told to leave ahead of the rest of the force—given 48 hours notice, in fact, to get out. The reason, I think, was due to certain statements Mr. Pearson had made after his meeting with President Johnson who had come up, I think, to visit Expo at that particular time.

President Nasser, I believe, called Mr. Pearson an idiot at that time, if I recall the phrase, and there was a pretty nasty exchange back and forth. This led a lot of people to say that it was most unlikely that Canada would ever be involved in a peacekeeping force in that particular area again. That is what I meant by the use of those words. That was the reference. I really have not been watching this area particularly closely, but I have not seen any significant changes in the relations between Canada and the United Arab Republic. Certainly we did not break relations with the UAR.

Mr. Stewart (Cochrane): My impression is that our relations are quite good with them, although I sometimes wonder why when everybody in this country, under the guise of taking a nonpartisan view of things, seems to, at least the media and so on seem to, side invariably with the Israelis in the Middle East war.

I wonder if you could give me an opinion, Dr. Granatstein? A while ago Mr. Cafik raised the point that both England and ourselves have a common Queen and you said that this did not seem to make any difference. Do you think that the international community regards the fact that we have a Queen

nominally as not being really significant that it is with a nominal affair?

Professor Granatstein: It certainly would be my opinion that it bears no importance in our relations with other states. It does not help us; it does not hinder us.

● 1215

Mr. Stewart (Cochrane): Thank you very much.

The Chairman: Mr. Harkness.

Mr. Harkness: Professor Granatstein, I take it that the crux of your presentation is in this sentence on page 7:

What now needs to be done is to make peacekeeping—in its broadest sense—the *raison d'être* of the Canadian forces.

Professor Granatstein: Yes, sir.

Mr. Harkness: Then, I think, we need to examine the validity of that concept.

Professor Granatstein: Yes, sir.

Mr. Harkness: First of all, from the point of view of what the demands on Canada are likely to be as far as peacekeeping are concerned, do you think they will be such that they would require at a maximum more than 3,000 people at any one time?

Professor Granatstein: I said, sir, "its broadest sense". I was not talking only in terms of UNTSO, UNFICYP and UNEF type forces, I was making peacekeeping a phrase broad enough to include our participation in NATO in that sense. In effect I was saying that we should be building and expanding upon this allied command Europe mobile force role that we are operating in—operating as a NATO mobile reserve—if we are going to stay in the alliance.

Mr. Harkness: I think that is a different thing altogether. My personal view is, of course, that NATO has been far more responsible for maintaining peace than has the United Nations in the past 20 years.

Professor Granatstein: That is arguable.

Mr. Harkness: However, the matter of providing peacekeeping forces as they are generally understood for NATO purposes is a much narrower thing altogether, and this is the matter to which I am particularly addressing myself at the moment.

Professor Granatstein: What I did say, sir, was that by making all the forces air mobile, by concentrating

on the control of conflicts, by basing all our forces in Canada, Canada could fill a useful role in the NATO reserve while still keeping itself ready for peacekeeping operations.

Mr. Harkness: To come back to what is generally understood as peacekeeping operations apart from the military alliances which serve that basic purpose, how many people do you think would be required as a maximum at any time as far as Canada is concerned for peacekeeping purposes?

Professor Granatstein: The most we ever had abroad at any one time, I think, was of the order of 3,000 as you say.

Mr. Harkness: I do not think we have ever had anything like that abroad at one time.

Professor Granatstein: When we had people in UNEF, Cyprus, UNIPOM and Kashmir I think we were close to the 3,000 figure.

Mr. Harkness: I think you will find it more of the order of about 2,000. In any event, I put 3,000 as the absolute maximum. Do you think it is a practical proposition, then, if you are going to make this your main role, to maintain forces of anything like the size we have at the present time?

Professor Granatstein: I had better make this clear again. I was not suggesting that UN peacekeeping be our only role. I do not think anybody can credibly maintain that. I am suggesting that peacekeeping in its broader sense, which I take to include a contribution to NATO, of the kind I dealt with here, requires a larger force.

Mr. Harkness: Would you not also include a contribution to NORAD, which purpose is purely defensive?

Professor Granatstein: The question is not whether its purpose is defensive; the question is whether its defensive purpose is a useful one and I do not think it is.

Mr. Harkness: We have a difference of opinion there. However, coming back to United Nations straight peacekeeping operations, you would agree then that the number of forces we need for that purpose is quite limited.

Professor Granatstein: The number of forces that we are liable to commit actively abroad for UN purposes is likely to be quite limited. The number of forces in terms of back-up, in terms of training, and so on, will not be quite so limited. The kind of force structure that I would like to see would, in fact, be able to do that kind of thing as well as other roles.

Mr. Harkness: From that point of view we are not too far apart, because I think the United Nations peacekeeping role which we should have as one of our roles is one that can be carried out by relatively small numbers of people actively taking part in the operation. Second, in order to carry out that role, I think it is essential that we have what you might call a well-balanced force.

The point is that so far as these peacekeeping operations are concerned you never know; we have not known in the past and we are not going to know in the future what we are going to be asked to supply. Actually, on the basis of past experience, the only way we could have met the demands made on us was by having reasonably well-balanced types of forces such as we have.

Professor Granatstein: I do not agree with that at all, sir. When have we ever required artillery in any peacekeeping operation? When did we ever require heavy tanks in any peacekeeping operation?

Mr. Harkness: To date we have not required them, but what we have required in the past so far as the Congo is concerned is signallers which nobody else, as

● 1220

it happened, was able to provide and because of the type of forces we maintain we were able to provide these signallers. In the Gaza strip operation we were required to provide medical personnel, vehicle repair people, army service corps types for supply purposes and a reconnaissance squadron. Once more, as I say, we were able to provide these only because we had well-balanced general forces.

Professor Granatstein: The structure I am suggesting, in fact, would be able to meet every one of the cases you have cited and would be able to meet virtually every foreseeable case in the future. There are not likely to be any UN operations that are going to require a mechanized brigade or forces operating with tanks and artillery in an integrated sort of nuclear or heavy conventional role. There is just no way.

Mr. Harkness: It is not probable; it is possible but it is not probable, but the main point I am getting at is that this, in my view, needs to be really a subsidiary role rather than a main role, because the number of people that will be required is always limited and the type of forces that is going to be required you do not know. Therefore, the only way that you can provide them is by a pretty well-balanced type of force.

Professor Granatstein: The difficulty, sir, is that you keep operating on your own definition of peacekeeping and not on mine. If we could agree on the definitions we might be able to discuss it.

Mr. Harkness: I tried to limit it to UN . . .

Professor Granatstein: I try to expand it.

Mr. Harkness: . . . peacekeeping operations so far as the questions I was asking are concerned.

Professor Granatstein: I would agree with you. It is likely to be a relatively small number of men. I agree it is likely to require perhaps infantry, perhaps communications, perhaps transport and service people. I agree, but I maintain that those could come from an air mobile force, a force essentially, if it is going to be based in Europe and in Canada, operating on the same kinds of role with the same kind of equipment. It could come as well from that kind of force as it can from what we have at present. That is all.

Mr. Harkness: I agree that may well be the case.

Professor Granatstein: Then we are in agreement.

Mr. Harkness: I think the basic disagreement so far as we are concerned is that I think one of our main roles should be in NATO and I take it you do not think that is the case.

Professor Granatstein: Ideally, I have said, I do not. What I did say was that it seems very unlikely that the NATO role is going to be dropped as things stand at the moment. If you read the papers this morning, the foreign policy review group and the combined departments that were dealing with it recommended staying in. If that is, in fact, so this probably makes it very likely that we will stay in.

Now, what do you do? Do you do exactly the same thing you are doing now? Is the status quo somehow engraved as part of the Ten Commandments because we have been doing it for 15 or 20 years? Why can we not change our role and get something that is perhaps useful to NATO and also useful to our other role? That is what I am suggesting; I think it is a much more useful role.

The difficulty, sir, with what you are suggesting is that we are going to have to maintain the present size of the force. That means the budget is going to have to be raised and that is something I think is very unlikely, and I suspect the gentlemen on this side of the table think it is very unlikely as well.

The Chairman: Mr. Granatstein, in reply to Mr. Harkness you mentioned that you were not sure that NATO had been a greater force for peace than the United Nations. I think you probably would agree that the United Nations have not been able to achieve the high hopes that we held out for it originally when it was formed.

Professor Granatstein: There is no question about that.

The Chairman: Could you tell us the basic reason for this and whether there is anything that Canada should be doing over the next few years to try to remedy any defects which have resulted in this?

Professor Granatstein: The basic reason that the UN has not been as successful as was hoped?

The Chairman: Yes.

Professor Granatstein: I suppose the basic reason is that when the UN was set up in 1945 and the Charter drawn up it was based on the assumption that the Great Powers would co-operate together and would work together to enforce peace. As it turned out by about late 1945 or early 1946 this was not the way; this was not going to work at all. Once that happened the whole elaborate structure that had been built into the organization became useless. We were forced into a position where, in order to have any kind of intervention capacity, any kind of capacity to intervene in troubled areas in the world, you had to improvise.

● 1225

You had to improvise in ways that were perhaps not at variance with the Charter, but certainly involved some radical rethinking concerning the way the Charter of the United Nations could be interpreted. Perhaps what we should be doing now is trying to put as many teeth as we possibly can into the United Nations capacity for operating in a collective security framework.

Certainly this is something this government, the past government and virtually every government, in fact, since the early fifties has been doing, trying to make the collective security role of the UN a more viable one. I think we should continue along this line. That is one of the points I tried to make.

The Chairman: In other words, you feel that there is still some possibility of the UN evolving into the type of organization that can extend collective security and that we are not obligated to rely necessarily for the future upon alliances.

Professor Granatstein: You would have to be pretty visionary to be able to agree to that kind of line. I do not think you can. The United Nations has not demonstrated as yet too much real willingness to go this way. Hopefully it will some time in the future, but you cannot base a policy on a hope. I grant this and I recognize this.

The Chairman: Professor Eayrs seemed to indicate in his testimony that perhaps we should change our role in NATO or even withdraw from NATO, but only if we could negotiate some concessions from the other side. I am not sure just what concessions

he had in mind. Do you feel there would be any possibility, if we were to change our role or reduce our role in NATO, that a similar reduction could be negotiated with the Warsaw Pact countries?

Professor Granatstein: I read Professor Eayrs' testimony on the plane on the way up. I received it only yesterday. My recollection is that during the questioning on that day somebody raised the point that Rumania had evinced some kind of interest in this kind of swap-off, and if something like that could be arranged I think it would be a splendid approach if it could be advanced and worked on.

The Chairman: Do you think it is worth trying to negotiate such a concession?

Professor Granatstein: Yes, absolutely.

The Chairman: You do not think it is completely visionary or way out?

Professor Granatstein: No, I do not think so. I think it is relatively realistic.

The Chairman: In your view is there any possibility at all in the course of these negotiations of getting both the U.S. and the U.S.S.R. to agree that they would not dispatch missiles through Canadian airspace? Is that the type of concession that could realistically be put into negotiation or is that something which is just too visionary?

Professor Granatstein: I think that is probably too visionary, because it is the shortest missile route. It is most unlikely that either side would agree to anything like that, I would expect.

The Chairman: Thank you very much. Are there any other questions from members of the Committee?

Mr. Nowlan: I have a couple based on one of your last questions. Would the professor be surprised to be informed that perhaps there have been negotiations for swap-offs over the last 10 or 15 years and they have not really produced too much?

Professor Granatstein: Perhaps the international climate may change; that does not mean that you rule it out forever.

Mr. Nowlan: No, that is fine, but the question I really wanted to ask, Mr. Chairman, concerns something the professor said earlier in answer to Mr. Forrestall who is no longer here. It is not necessarily a parochial question. He mentioned Maritime Command as being fat cats. I would like him to elaborate on that if he can with this premise: if a Maritime Command, both on the Pacific and the Atlantic with

our coast line, is not going to perform some type of surveillance service, does he envisage leaving this completely to the United States, both in the air and at sea? I am not necessarily talking about four defence destroyers at an extra cost; I am thinking of a Maritime Command service.

Professor Granatstein: I did not say you should sink all the ships. I did not suggest that. I think it is probably fair to say that Maritime Command has been rather well favoured in some ways in terms of equipment—the four destroyer escorts at \$50 million plus each, the lavish refitting of the *Bonaventure*, and so on. I think we probably have to have some kind of surveillance function, but that does not mean you need to base a force entirely on anti-submarine warfare as, in fact, we have done now.

● 1230

You can upgrade the coastguard and use it for that kind of purpose.

Mr. Nowlan: This is what I want to clarify. You are not suggesting that because the present function,

in your view, may not be directed correctly a Maritime Command in whatever form should be abandoned.

Professor Granatstein: Oh, no.

Mr. Ryan: Professor, arising out of the Chairman's questioning, I wonder what you would have to say in connection with the apparent concern and upset in West Germany which has come to a head as a result of President Nixon's visit, about the prospect of the Soviet-U.S. talks regarding disarmament. Would you care to comment as to whether or not you feel that this initiative is in the teeth of the Harmel Report?

Professor Granatstein: I think I had better pass on that, if you do not mind.

The Chairman: Are there any other questions to Dr. Granatstein? If not, Dr. Granatstein, on behalf of the members of the Committee I would like to thank you most sincerely for your very helpful testimony.

APPENDIX PP

PEACEKEEPING: WHAT FUTURE ROLE FOR CANADA?

Without question peacekeeping has won Canada more international plaudits since 1945 than any other aspect of our foreign and defence policies. In Kashmir, in Palestine, in Cyprus, Suez, Yemen, and the Lebanon, Canadian servicemen have carried out a wide variety of tasks in a manner that reflected only credit on them and their country. And yet since the debacle at Suez in May, 1967 peacekeeping has been in the eclipse in Canada—and in the United Nations, too. Is the concept of peacekeeping still viable as we prepare to enter the decade of the 1970's? Are there likely to be crisis situations that will require the damping down that a peacekeeping force can provide? Will Canada be asked to participate in any such future forces? This brief essay will attempt to posit possible (and, I hope, plausible) answers to these important queries.

Peacekeeping as it developed and as it has been practised since 1948 was pragmatic in the extreme. The drafters of the United Nations Charter had envisaged nothing like UNMOGIP or UNFICYP when they created the world organization in 1945. Then they had believed that massive forces provided by the Great Powers would enforce peace on any aggressor presumptuous enough to flout the united will of the Big Five. The difficulty was that the Big Five, of course, never had and never developed a united will. The result was a paralysis of the United Nations collective security function. Crises continued, however, and the United Nations was forced to improvise observer forces in Palestine and Kashmir before the end of the 1940's. After the outbreak of the Korean War in 1950, where action had been possible only because the Soviet Union was fortuitously boycotting the Security Council, there was an understandable fear in the West that the Russian veto could paralyze any future attempts to enforce collective security. The solution was the "Uniting for Peace" resolution of 1951, a clever device that allowed the General Assembly to act in cases where the Council was deadlocked. Ironically the first use of the 1951 resolution came in 1956 when the Assembly agreed to the establishment of UNEF over the vetoes of Britain and France, two of the sponsors of the Uniting for Peace resolution.

Not even the Suez Crisis of 1956 was able to force the United Nations to move to the establishment of a genuine standby force, with plans in readiness and an able staff at New York. In 1957, Secretary of State for External Affairs Pearson called for action to this end, as did Prime Minister Diefenbaker in his first appear-

ance before the United Nations in the same year. But when the Congo erupted in 1960, improvisation again was the order of the day. The same was true in the Cyprus crisis of 1964. After the disorganized launching of UNFICYP, the Canadian government again attempted to push the UN toward standby arrangements, and in 1964 it convened a conference in Ottawa that attracted representatives from 23 countries. The Ottawa Peacekeeping Conference was followed by the establishment at the United Nations of a 33-nation Special Committee on Peacekeeping Operations in 1965, but this committee unfortunately got bogged down in fruitless haggling about the financing of these operations (a bone of serious contention since the Congo operation) and no major progress was made.

The near-failure of the Special Committee was a serious blow to the peacekeeping ideal and to Canada's plans, but the crushing shock came in 1967 when UNEF collapsed. The resulting third Arab-Israeli war seemed to be the *coup de grâce*. In Canada particularly the shock caused by President Nasser's peremptory expulsion of the Canadian contingent in UNEF was severe.

Even before 1967 criticism was beginning to be heard about Canada's role in peacekeeping. From some on the left came the cry that peacekeeping served only to prop up decadent regimes, that it froze crises and prevented their resolution in revolution. Some academics, some political figures, and some military officers felt that peacekeeping was a waste of time, something that distracted the Canadian forces from preparation for their real role—that of fighting the Russians. Still others attacked the government for being too restrictive in the locales to which it committed Canadian peacekeepers. After the Suez fiasco, this criticism increased in volume, and the Canadian penchant for endless agonizing about national status now seemed to focus in part at least on peacekeeping. Even here, the refrain went, Canada had failed abysmally.

Is peacekeeping in fact a dead duck? I think not. Certainly the idea has taken hard knocks, but it is not yet dead. Crises will continue to arise on every continent, and there will be a need for some international agency—not necessarily the United Nations—to intervene in some of these potential conflicts. There is little likelihood that permanent peacekeeping forces will be created in the foreseeable future, but the improvi-

sation that has so marked the development of peacekeeping is, I suspect, only waiting on an occasion. The possibility of future international peacekeeping—or peace-enforcing—forces cannot be ruled out.

If there are future peace operations, would Canada be invited to participate? As a Caucasian nation, critics say, Canada is not likely to be permitted to participate in operations in Africa and Asia. Even in 1956, they maintain, Nasser objected to Canadian troops because they were white, "soldiers of the Queen", and indistinguishable from the invading British. All this is true enough. Canada is unlikely to be the first choice of many African or Asian states. But I would suggest nonetheless that Canada is almost certain to be involved in any future peacekeeping operation involving forces greater in number than observer groups. The reason is simple, but perhaps not immediately obvious: military necessity. By tradition the Great Powers are barred from participation in United Nations peacekeeping efforts. Where then will the airlift be found for operations within the host country? Where will the communications personnel be located? Canada is one of the very few countries outside the ranks of the Great Powers that has a complete military force in microcosm. We have air transport capability, we have skilled communications personnel, we have a large supply organization. No Asian or African state has this kind of force, trained and ready for operations.

This Canadian capability has in fact been the reason for our employment on at least two United Nations operations. In Suez in 1956, for example, the Canadian government was pressed to provide supply personnel after General E. L. M. Burns, the UNEF Commander, could not secure them elsewhere (and after Colonel Nasser proved unhappy with the unluckily named Queen's Own Rifles). Again in 1960, the United Nations strongly pressed Canada to send a signals unit to the Congo. These urgings, when joined with the strident demands of the press for Canadian participation, were sufficient to virtually force the government's hand, despite the Prime Minister's clear statements in Parliament that Canada's contribution would be strictly limited. The point is that even in the Congo, a black state in the throes of nationalism, colour proved no barrier to the employment of the Canadian signallers. Their bilingualism, in fact, proved a great asset.

Does our participation in NATO and NORAD hinder our participation in peacekeeping? In 1954, Canada was selected to serve on the International Control Commissions in Indochina because she was considered a "western" state. In 1956, Nasser apparently believed that Canada was acting as she did at the United Nations only to get her NATO allies, Britain and France, off the hook. In 1960, the Soviet Union objected to Canadian participation in UNOC on the grounds that "colonialist" Belgium was a NATO ally. Obviously then Canada has been asked to serve on

peacekeeping operations both because of our alliance posture and in spite of it. The key point, however, is that we were asked to serve. It is difficult to argue, therefore, that our ties to NATO or the United States have hampered us in our participation. That we are in NATO and NORAD, in fact, is undoubtedly the reason that we have the military capacity to act for the United Nations. On the other hand, at the time of the Congo crisis, there was severe difficulty in finding enough signallers for UN service, primarily because of our commitment to NATO and to continental defence. In addition, it is probably impossible to argue that we have been wanted for peacekeeping because of our links to NATO and Washington. Canada has participated in all the peacekeeping operations since 1948 because she wanted to and because she has had the capacity to do so. So long as these factors hold true, there is no question in my mind that Canada will be able to participate in any future operations.

The point that must be made, too, is that peacekeeping is relatively cheap. In terms of the prestige we have received and the diplomatic credit we have built up, peacekeeping has been a great bargain. Today Canada is probably in a better position than ever before to participate in peacekeeping (notwithstanding the manpower shortages in the Canadian Forces). The Commando Regiment, for example, will be capable of operating anywhere on short notice. The two battalions committed to the Allied Command Europe mobile force are similarly ready for fast deployment.

What now needs to be done is to make peacekeeping—in its broadest sense—the *raison d'être* of the Canadian Forces. The commitment to a nuclear role in NATO should be liquidated, as should our provision of a mechanized brigade. By making all the forces airborne, by concentrating on the control of conflicts, by basing all our forces in Canada, Canada could fill a useful role in the NATO reserve while still keeping itself ready for peacekeeping operations as they may arise. Such a plan could result in a manpower cut of 15,000-20,000 personnel and a huge saving in personnel costs. The saving could be invested in equipment, something that the Canadian Forces desperately need.

In conclusion then, the prospects for peacekeeping seem to me to be as follows:

- a. There is little likelihood that the United Nations will make arrangements for standby forces;
- b. There is a good chance that peacekeeping operations will be mounted in the future;
- c. Because of Canada's military capabilities, it is likely that Canadian Forces participation will be requested for future peacekeeping operations. Neither colour nor our alliance posture are likely to interfere with this possibility.

CURRICULUM VITAE

JACK LAWRENCE GRANATSTEIN

BORN:—May 21, 1939, Toronto.

RESIDENCE:—53 Marlborough Ave., Toronto 5.

MARITAL STATUS:—Married, 2 children.

EDUCATION:—

Graduation diploma, Collège Militaire Royal, 1959
B.A., Royal Military College of Canada, 1961
M.A., University of Toronto, 1962
Ph. D., Duke University, 1966.

DISSERTATION:—

"The Conservative Party of Canada, 1939-45" (Dr. Theodore Ropp).

AWARDS:—

Governor General's Medal, Collège Militaire Royal, 1959
Lieutenant-Governor's Medal, Royal Military College, 1960
Queen Elizabeth II Ontario Fellowship, 1961
J. B. Duke Fellowship, Duke University, 1963, 1964

Canada Council Pre-Doctoral Awards, 1963, 1964, 1965

Canada Council Research Grant, 1966-7-8-9.

TEACHING EXPERIENCE:—

Assistant Professor, York University, 1966 to date.

RELATED EXPERIENCE:—

Historian, Directorate of History, Canadian Forces Headquarters, Ottawa, Summer, 1964; 1965-6.

MILITARY SERVICE:—

Canadian Army, 1956-66.

AREAS OF RESEARCH INTEREST:—

Conscription; The Conservative Party; Canadian Defence and Foreign Policy.

PUBLICATIONS:—

"How the Tories of Old Switched Leaders," *Globe and Mail*, October 27, 1966.

"The Conservative Party and the Ogdensburg Agreement," *Int J* (Winter, 1966-7). 73-6.

"Conservative Party Finances, 1939-45," in Canada, Secretary of State, Committee on Election Expenses, *Studies in Canadian Party Finance* (Ottawa, 1966), 257-316.

APPENDIX QQ

SPEECH BY THE HONOURABLE LEO CADIEUX

MINISTER OF NATIONAL DEFENCE

TO

THE ROTARY CLUB OF OTTAWA

27 JANUARY, 1969

"CANADA'S ESSENTIAL SECURITY REQUIREMENTS"

Over the past few months there has been a heightened, and I might say gratifying, interest in Canadian Defence Policy. Much of this interest has been stimulated by the review of Defence and Foreign Policy. It is notable that statements made by the Prime Minister, by myself, and by other Ministers have encouraged people outside government to contribute to the review process by participating in the public discussion and debate.

In this context I thought it might be useful if I were to go over some of the fundamental considerations which bear on our Defence Review. I am not going to tell you what the policy will be—we have not decided that yet—rather it is with the desire to stimulate discussion on matters of serious national import, that I am speaking to you this afternoon.

Our position on the face of the globe, and the similarities in outlook we share with the United States, have in the past given us a position, from the defence point of view, which few other nations of the world enjoy. Since we became a nation we have prospered over the long run, and we have been unhampered by direct external military threat or interference. We live in a changing world, and we must from time to time reassess the basis of our defence activities. This we are doing now.

The Armed Forces that Canada created in years past have been among the finest in the world. For a traditionally non-militaristic country we can be proud of the quality of the sailors, soldiers, and airmen Canada has sent to all parts of the world in the cause of peace, freedom, and justice. I am sure that there is not one here today who has not at some time been stirred by the battle honours won by Canadian fighting men, who laid the foundation for Canada's present enviable reputation—indeed many of you undoubtedly helped to write these pages of Canada's history. Canada continues today the same traditions in its armed forces.

The modern serviceman is a skilled specialist. He has the split-second reactions and the highly developed sense of team-work demanded by new, complex equipment.

These qualities can only be developed and maintained in a professional force of highly trained, highly motivated, and dedicated men and women. We have such a force today. Such competence takes many years to develop, and we must be sure we know exactly what we are doing before disbanding any part of it.

I know you will agree with what I have said about the quality of Canada's Forces. The questions we are concerning ourselves with today are:—Why do we need them? What are the tasks and missions they are to perform? Why must Canada devote a significant portion of its resources to the support of armed forces? The answers to these questions must be based on Canada's essential security requirements.

I would like to give you some of my thoughts on these requirements. In view of the time available, however, I will have to omit any discussion of the important problem of internal security.

The Basis of Canadian Security

The advent of the nuclear age removed the comfortable invulnerability which geography afforded both Canada and its friendly, but very powerful, neighbour. Although Canada cannot be thought of as being threatened directly, that is in its own right, by the long range bombers, missile-launching submarines, and intercontinental ballistic missiles of any of the nuclear powers, it is nevertheless a fact that we are uniquely positioned between the two superpowers. Indeed, a glance at a polar projection map will quickly convince you that we are similarly placed with respect to the People's Republic of China—a possible future intercontinental nuclear power.

The bulk of our population and national assets are so close to our border with the United States that we could not hope to escape destruction as a viable society, should an all-out nuclear exchange take place. Even in the unlikely event that our cities are not planned targets, damage and loss of life would be widespread and severe. I believe that the Government of Canada has a dual responsibility to the people of Canada in responding to this threat to our security.

First, we must continue to do whatever can be done to ensure that the nuclear balance is not disturbed, and even more important, to do what is possible to enhance the stability of the balance.

Second, we must not slacken our efforts toward helping to create and maintain the kind of world in which peace can be assured without the necessity of the balance of terror. However, until we come much closer to an ideal world, first priority must be given to those measures which contribute directly to the security of Canada.

Disarmament

I say this with no intention of detracting from the importance of efforts aimed at eventually de-escalating the massive confrontation of nuclear arms. Canada has been an active and effective member of the Eighteen Nation Disarmament Committee. I might take advantage of this opportunity to mention how fortunate Canada has been to have General E.L.M. Burns as leader of the Canadian delegation to the Committee, during its frustrating and protracted negotiations in Geneva. In a sense, as a distinguished ex-soldier, General Burns symbolizes the close relationship between Canadian defence and disarmament interests.

Canada has given full support to the objectives of international disarmament endeavours, and has contributed significantly to their achievements. Notable among these have been—

- * The treaty banning nuclear testing in the atmosphere, outerspace and undersea, which has been scrupulously observed by all signatory nations since its agreement in 1963;

- * the treaty banning the stationing of weapons of mass destruction in outer space, which as far as we can know, has also been faithfully observed;

and the most recent major success,

- * the Nuclear Non-Proliferation Treaty, which is aimed at limiting the further spread of devastating power in the hands of individual sovereign states. Earlier this month, Canada was among the first of the nations of the world to ratify the Non-Proliferation Treaty.

There is no question of the value of Canada continuing its disarmament efforts.

The Strategic System

Now, what about the strategic system, whose stability is so essential to Canada's security? The nuclear balance is an extremely complicated affair. It is much more than a mere counting of the bombs and missiles in the respective nuclear arsenals. The balance involves a large array of separate measures and counter-measures, and is constantly shifting and changing with advances in military technology.

There are three main types of systems for the delivery of offensive weapons: bombers, submarines, and inter-continental ballistic missiles. Although it would contravene the "use of space" treaty, a fourth possibility is the earth satellite. Matched against these are the defensive systems: anti-bomber interceptors and missiles; anti-submarine undersea, surface, and air weapons; and anti-ballistic missile systems. All these components, both offensive and defensive, are closely interrelated in the intricate organism which constitutes the overall strategic system.

The strategic balance depends not only on how many offensive weapons each side has at its disposal, but also on how they are armed and fitted, on the manner in which they are planned to be used, and on the defensive systems deployed against them. The balance is continuously adjusted as both sides take whatever measures are necessary to ensure that the other side does not reach the stage where he can strike first, and strike in such a way that he is confident he can escape devastating retaliatory damage. Neither of the superpowers have such a first strike capability today. Either could suffer a nation-destroying all-out strike, and still have available surviving nuclear forces capable of inflicting comparable damage on the attacker. These survivable forces make up the so-called second strike capability.

Air Defence in the Strategic System

Let us look more closely at the place of the bomber in the strategic system. At the moment, the superpowers find it more economical to concentrate offensive capability in intercontinental and submarine-launched missiles. But why is this so? Simply because effective defence against bombers is feasible and both sides maintain such defences—just enough to discourage the other side from investing in the cheaper and more accurate delivery system that bombers represent.

What would happen if one side abandoned its bomber defences? In all likelihood, the other side would immediately do most of the following things:

- * Refurbish the bombers it still has in service.
- * Modify some of its transport aircraft to carry bombs.
- * Build more bombers.

- * Perhaps use tankers and heavy tactical aircraft as bombers.
- * Remove the jamming equipment from its bombers and replace it with more bomb racks.
- * Forget about using load-limiting stand-off missiles, and finally
- * Target to cities intercontinental missiles which had previously been aimed at air defence facilities.

The balance would be quickly distorted to a much greater degree than that implied by the original "bomber threat".

One side would have available an inexpensive offensive system, which would threaten both the population and the land-based second strike forces of the other. Any movement toward such a situation would be destabilizing and must be discouraged. Thus, air defence will be needed as long as bombers represent either an existing or a potential threat to second strike forces.

Because of our geography, it is doubtful that the United States could, in the foreseeable future, maintain an air defence system adequate to meet the requirements I have just reviewed, unless there is close and active cooperation from Canada. If we made life difficult for the United States in its endeavours to establish adequate air defences, we would only make the nuclear balance less stable. Such behaviour on Canada's part would be acting against Canada's own security interests. Canada's defence cooperation with the United States has developed by a series of carefully negotiated agreements, arising out of the joint pronouncement of Prime Minister King and President Roosevelt at Ogdensburg in 1940. NORAD is an important example of such cooperation, and has served Canada well. In my view, NORAD is still important to Canada's security.

Anti-Submarine Warfare in the Strategic System

Another important aspect of the strategic balance relates to defence against missile-launching submarines. Suppose one side were to abandon its peacetime anti-submarine surveillance efforts or its operational submarine attack capabilities. The other side could then use much less sophisticated and much cheaper submarines, and therefore be able to produce and operate more of them. He could plan on launching the missiles from shorter range and hence larger or more numerous warheads could be carried in each missile. Again, the balance would be disturbed and the world would be less stable.

The most efficient way of one side denying such an advantage to the other is to maintain some anti-submarine capability. Furthermore, it is prudent to support an active program in anti-submarine technol-

ogy development, in order to be alert to breakthroughs which might endanger the invulnerability of submarine-based second strike capabilities. Such a program, to be effective, must be tied in with significant operational anti-submarine activities.

Our cooperation with the United States in anti-submarine operations is another important example of the furtherance of collective security, in the spirit of the Ogdensburg Declaration.

Europe and NATO in the Strategic System

Let me now turn to Europe and NATO. You may recall that last December, in speaking to the Standing Committee of Parliament on External Affairs and Defence, I indicated that, in my view, there is only one major military threat to Canada. This is the threat associated with the catastrophe which would befall us if the superpowers were to become engaged, from whatever source or reason, in an exchange of nuclear weapons.

Where does Europe fit into this proposition? The Soviet Union has stated over and over again that it considers Eastern Europe as vital to its security. Similarly, the United States has taken great pains to convince both sides that it considers Western Europe vital to its security.

The Soviet Union gave ample illustration of its position when it invaded Czechoslovakia last August. If we had any doubts before, we can have none now, that the Soviet Union will not hesitate to use force in the most blatant fashion to preserve what it considers to be its vital interests in Eastern Europe.

The United States lends credence to its position by stationing permanently in Europe large numbers of its armed forces, as well as by contributing extensively to other aspects of West European defence.

We must assume that if any East European aggression towards Western Europe is not successfully contained at a low level of warfare, it can only result in escalation to a general nuclear exchange between the two superpowers. This obviously affects Canada's security. Furthermore, there is no other area in the world where the United States and the Soviet Union are both committed to the ultimate limit. Thus, aside from any considerations of history and tradition, Europe is of unique concern with respect to Canada's security.

Fortunately, machinery exists through which Canada can contribute to deterring aggression and maintaining stability in Europe—indeed this machinery exists in part because of the efforts of the Canadian government and parliament, fully supported by the Canadian people, in the uneasy years immediately following World War II. NATO, including its integrated command structure, provides, I believe, an effective means of ensuring that conflicts of interest or

of ideology in Europe are contained and resolved without resort to cataclysmic violence. NATO represents today the only existing institutional arrangement for furthering Canada's security interests in Europe.

All of us would prefer to see a settlement devised in Europe, which would solve the legacy of division left by War. From Canada's point of view, no settlement can be acceptable unless it satisfies the security needs of the European people in such a way that an enduring peace can be assured. Nothing less would meet Canada's own security needs. In the meantime, it is in our interest to do what we can to ensure a stable situation.

Successive rungs to the escalation ladder are provided in Europe through conventional forces and tactical nuclear weapons. These contribute to stability by demonstrating to the other side that NATO is prepared to cope with aggression at whatever level the Alliance decides is an appropriate response to the aggressor's acts. NATO's capability for flexible response supports the ultimate strategic guarantee. As Robert McNamara said when he was United States Secretary of Defense, "a credible deterrent cannot depend on an incredible act".

Modern tactical forces represent an area where Canada's advanced technological position and military expertise can be put to very good use as part of our share in contributing to the Alliance objectives, and thereby assuring our own security.

At the same time, NATO gives us an opportunity to take part in the efforts toward détente between the nations of East and West Europe, which hopefully will, in time, create the climate of confidence in which an accommodation on the issues which now unsettle Europe can be reached. Only in the event of a large measure of success in the endeavours toward détente would withdrawal from the military aspects of the European Alliance be in Canada's interest.

How Large Should Canada's Defence Effort Be?

I have not yet said anything about how large Canada's defence effort should be. The same principles apply to both the extent of our continental defence activities and to the size of our NATO force contribution. Both are related to Canada's security in a similar way, since both are elements in the strategic nuclear balance.

Moreover, both are effective in adding to nuclear stability only because they are carried on through collective arrangements. It may be reasonable to act as the unbiased mediator and peacemaker when your own interests are not directly involved—it is quite another thing when the survival of the nation is at stake.

These two factors: the relation to Canada's security, and the alliance or collective nature of our major defence activities, suggest two questions on which we should base judgements concerning the size of our forces:

- * First, with regard to security, what proportion of Canada's national resources should Canadians devote to their own security?
- * Second, with regard to alliances, to what extent does Canada want to participate effectively in the decisions which affect its security?

The answers to the two questions must come ultimately from the people of Canada themselves. We in government can and will do our best to reflect the national will in these matters, but the more thought, the more discussion, and the more communication by individuals and groups within our nation, the better will we be able to understand and act upon the nation's wishes. Canada's security must ultimately rest on the national will to do what is necessary.

The evidence of the success of Canada's security measures in the past is the fact that we, today, are still free, still relatively prosperous, and are now concerning ourselves with what the security measures of the future ought to be. Our attention is continually diverted by other important and far-reaching national and international problems, but these can only be solved in a stable and secure world.

Major Security Considerations

This afternoon I have outlined for you some of the factors which I believe to be important for Canada's security. Let me briefly go over the main points.

- * First, the only significant military threat to Canada's security is the possibility that the delicate balance of nuclear terror may be upset.
- * Second, our defence efforts should be tailored to reduce the chance of this happening.
- * Third, air defence will be needed for an indefinite period in the future.
- * Fourth, anti-submarine operations contribute to Canada's security objectives.
- * Fifth, continued participation in NATO is essential to Canada's security interests at the present time.
- * Sixth, in the trilogy of Canada's security objectives: defence, détente, and disarmament; none can be neglected.

- * Finally, the size of our defence effort must be a reflection of the will of the people of Canada to act on behalf of their own security.

National Defence is a serious business touching the lives and destinies of every Canadian family.

It is important for all Canadians to become informed on the issues concerning Canada's security. We must all be assured that the future will include, for Canada, a realistic national security policy.

APPENDIX RR

TEXT OF AN ADDRESS

BY THE HONOURABLE MITCHEL SHARP,

SECRETARY OF STATE FOR EXTERNAL AFFAIRS

ENTITLED

"THE ROLE OF MIDDLE POWERS IN A CHANGING WORLD"

AT CARLETON UNIVERSITY, OTTAWA

FEBRUARY 20, 1969

There is a faintly old-fashioned ring about classifying countries as great, middle or small powers. In the 19th century, and more or less up to the beginning of the second World War, nations were ranked by the size of their naval fleets and there were only five or six "great powers". They were the ones with battleships. Now the battleships have gone and so has the whole order that they symbolized. One of the really striking developments on the world scene in the past 25 years is the advent of vastly greater number of independent states. It is very much more difficult, if not impossible, to classify them as great, middle or small powers.

The concept of degrees of "power" in a sense remains. It is still true that nations have varying capacities to influence the course of events outside their own borders. It is also a fact that nations differ in their freedom and capacity to act within their own borders. None of us, of course, is completely independent. The actions of every nation impinge increasingly on the others and not even the greatest powers can entirely disregard the interplay of national decisions. But some of us have more ability than others to play an active rather than a passive role in the world.

This capacity of a state to pursue policies of its own choosing and to influence other states rests fundamentally on three factors: (a) economic capacity; (b) military strength; (c) diplomatic and political influence.

These functions are obviously inter-related and no nation can be considered a power of any consequence unless it has a measure of capacity in all three. Nevertheless, it is possible for a nation, by deliberate choice, to place great emphasis on one sphere of activity and much less on the others. It is also possible for a country to be compelled by circumstances to rely heavily on one source of national strength.

There are cases of nations which have considerable economic capacity but have chosen not to acquire or

to employ military strength. Post-war Japan is an economic power of major proportions which has decided to maintain only modest military forces and to rely on the United States for its security requirements. Britain, on the other hand, is a nation whose economic and military strength has undergone a relative decline. But British political influence is still very significant in large parts of the world where British military force is no longer dominant. We have other states militarily very strong in relation to their economic capacity and their political influence. Israel is an interesting example. The circumstances of that country's recent history have compelled it to devote an extremely high proportion of its resources to military purposes in order to survive.

In Israel we also have an example of another dimension to the whole question of the "power" of modern states—the geographical dimension. A nation may play an important part in some region of the world because of its capacity in one or more of the three factors I mentioned a moment ago, but its effective influence may not extend much beyond the region. Israel's military capacity relative to its neighbours is obviously very high and for this, as well as for other reasons, Israel is a key country in the Middle East. On the other hand, in terms of its size and population Israel must be considered as a small country, measured on the world scale.

There is one more dimension we must keep in mind if we would place the nations of the world in some order of rank. It is the dimension of time. A country may be apparently strong and vigorous in one decade but mired in political dissension or plagued by economic crises in the next. The international scene is constantly shifting and the relative strengths of nations are rising or falling. We can never take for granted that the present order will remain unchanged for any great length of time.

Looking at the world today in the light of the variables I have referred to, it appears that there are really only two great powers—the United States and the U.S.S.R. They are the only countries which are at the same time immensely strong in economic, military, and political terms and have the capacity to exert their strength not just regionally but all over the world. They have, of course, the supreme ability to exchange intercontinental nuclear annihilation. No other nation is anywhere within reach of that dreadful capacity. It is probably more accurate to refer to the United States and the Soviet Union as “super-powers”.

I doubt that there is much point in attempting to classify those nations which are not super-powers. The fact of the matter is that the vast majority of countries have the capacity to exert *some* influence on the international scene, either in their own geographical area or in the world in general, or in one functional field or another, and therefore they fall into an indeterminate classification. We are nearly all middle powers. Apart from the two giants at the one end and, at the other, a certain number of very small states which are not capable of independent action to any significant degree.

If, then, the world is full of middle powers and their national capacities are of great variety, it is difficult to define a role in international affairs for middle powers as such. It is true of middle powers, as it is of all nations, that their role is largely predetermined by the resources they possess and their historical and geographical circumstances. The effectiveness with which they play that role is another matter. It is dependent upon an accurate and realistic assessment of their capabilities and a sensible choice of policies.

The capacity of the super-powers to affect the destiny of other nations is so enormous that middle powers must clearly be vitally concerned about the policies of the U.S.A. and the U.S.S.R. Middle powers have a right and a duty to seek to influence the actions of the super-powers. This influence is likely to be more effective if middle powers act collectively. Indeed, it might be taken as a general rule for middle and small powers that they can be most effective in almost every field of international activity if they act together.

The scale and form of collective action by middle powers depends on the purpose. It may be a functional purpose, as in an economic organization, or a geographical one, as in a regional organization, or it may be a universal objective pursued through the United Nations. The principle is the same. Collective action is likely to be more effective.

Sometimes a middle power may be able to play a special role in a situation where the super-powers, locked in contest for world-wide influence, dare not make a move. Such cases are rare, however, and their importance should not be exaggerated. Canada's initia-

tive over the Suez affair in 1956 is sometimes cited as an example of this role for a middle power, but let us remind ourselves that there were very special circumstances at that time.

I have arrived by this somewhat circuitous route at the acknowledgement that Canada is probably a “middle power”, however we define that term. It is plain that we have become a nation with significant economic weight. We have a population of twenty-one million and a gross national product of more than \$60 billion, and our economy is growing at a steady rate. We offer a market of considerable proportions for the products of other countries. In a number of products we are one of the leading producers and exporters. We have resources that are attractive to capital from outside our own country. We have a sufficiently high standard of living that we can well afford to contribute substantial resources to international activities without in any way weakening our own economy. In short, we are an economic power.

We also have an appreciable military capacity. It is not great in terms of the super-powers, nor is the approximately 100,000 men in our armed forces a very significant number by comparison with many countries whose population is smaller than ours. But our forces are well trained professionals, they are volunteers, not conscripts, equipped with modern weapons and capable of very effective employment in selective situations.

Canada also has a considerable capacity for political and diplomatic influence. We are a respected country in most parts of the world and in the United Nations and other international organizations. This is in part because we have no history of domination over other lands and no historic grievances to trouble our relations with other peoples. We maintain a corps of skilled professional diplomats, competitively selected from the best products of our universities. We have produced some outstanding political figures whose personal abilities have enhanced the influence of our country abroad, notably the Right Honourable Lester B. Pearson. Our people generally have shown a sympathetic understanding of the problems of other countries.

But what about the regional dimension? The peculiar situation of Canada is that we are a nation with adequate capacity to play a very considerable role in a regional setting but, for all practical purposes, our immediate region consists only of ourselves and the United States, which is one of the super-powers. It has been shrewdly observed that we are a regional power without a region. Therefore, we must look further afield.

A realistic assessment of the national capacity of Canada in the various fields I have enumerated, combined with our situation next to the United States,

leads inevitably to the conclusion that, if we are to advance our national interests and exercise real influence on the course of world affairs, we should do so in conjunction with other nations. Every government in recent Canadian history has come to this conclusion. Whatever functional area one examines, it is impossible to envisage Canada making its weight felt with maximum effectiveness unless we get the co-operation of a number of like-minded nations.

In the economic field, Canada has for a long time pursued the so-called "multilateral approach" to world trading problems. We have recognized that, in the face of our overwhelming economic involvement with the United States, it is in our interests, and those of the international community as a whole, to encourage the development of a liberalized multilateral world trading system, rather than an autarkic or bloc trading system. So, we have been strong supporters of GATT and the IMF. When trading blocs like the European Economic Community have developed, we have tried to ensure, by acting in concert with other countries that face similar problems, that the new economic groupings follow the principles of GATT and are not inward-looking and exclusive.

In the military field, a feature of the Canadian answer to the problem of effectively ensuring our own security for the past twenty years has been to work with other middle powers in NATO. Since Europe is the place where a conflict, if not contained, could lead to a nuclear holocaust which would inevitably engulf Canada, we have supported and contributed military forces to the security arrangements in which the countries of Western Europe have joined with the United States under NATO.

NATO, of course, is not just a military organization. Its members have been increasingly preoccupied with such problems as accommodation between East and West and with disarmament. For Canada, the opportunities our NATO membership has presented for close consultation with other middle powers have been of particular value in balancing up our rather unequal North American partnership with the United States. NATO is a unique form of close association with a group of other nations whose collaboration is important to the United States.

We are now reviewing our membership in and commitments to NATO in the light of the situation that has evolved since the alliance was formed in 1949. I have yet to hear any convincing argument that, if Canada wants to play a part in ensuring her own security, in the resolution of the security problems of Europe that directly affect our own fate, and in mitigating the confrontation between the super-powers, we could do so as effectively as within some such collective effort as NATO. We could opt out, of course. That is an alternative. We could decide not to participate with our NATO partners in the search for

collective security and a settlement in Europe. But the problems of a divided Europe will not disappear if we opt out. In or out of NATO, Canada cannot isolate herself from the consequences of failure to establish a stable order in Europe.

There are problems of peacekeeping outside Europe and, here too, Canada has attempted to make sure that our contribution is most effective by combining it with the contributions of other nations. Canada has been among the foremost supporters of peacekeeping operations under the auspices of the United Nations. We have participated in every peacekeeping operation undertaken by the U.N. since 1948. Unfortunately, because of the stubborn opposition of some important members of the United Nations, the prospects for permanent peacekeeping arrangements or further United Nations *ad hoc* peacekeeping forces are not good. I see no reason, however, not to go on patiently trying to find a way round the roadblocks that have been thrown up in the United Nations. There are a good many other middle powers in the United Nations that share our views and that are willing to join with us in maintaining pressure for the development of the peacekeeping concept.

There are numerous other instances of Canada fitting itself into groupings of nations organized to achieve some common purpose. One of the most interesting, and perhaps the most peculiar, of such institutions is the Commonwealth. It is, as you know, a very loose association of independent nations, with a modest secretariat. All are graduates of the British Empire school of nationhood.

The Commonwealth has achieved notable success over the past twenty years in easing the transition from colonial dependence to national independence for many members of the world community. It has still a significant role to play in bridging the gulf between the rich and the poor nations and in easing the racial tensions which unfortunately very often coincide with disparities of wealth and poverty. For Canada, the Commonwealth has continuing value as an instrument through which we may exert some influence upon the course of events in a large and important part of the world.

The supreme example of Canada joining with other nations to seek international objectives is our membership in the United Nations. In the U.N. and its associated international agencies we have the opportunity to play a part in every aspect of the struggle to build a stable and just world order—peaceful settlement of disputes, respect for human rights, liberalization of international trade, aid to developing countries, codification of international law. In most cases we find it advantageous to work closely in the U.N. with other middle powers, but not exclusively. Sometimes the cause of world order is advanced most effectively by supporting the initiative of a super-power. Sometimes

a very small state puts forward a valuable and important proposal, as Malta did on the exploitation of the resources of the ocean floor. Canada has long supported the principle of universality of membership of the U.N., in the belief that every nation has something to contribute.

I have touched briefly upon some of the things that Canada has been doing in the world and the reasons for some of the policies we have pursued in the past. I would now like to pose some questions about these policies and to suggest some directions which we might take in adapting them to changes in the world scene and in our own country.

As I mentioned earlier, one of the most dramatic changes that has occurred in the world scene in the past 25 years is the proliferation of middle powers. We live in a time of the dissolution of empires. The empires of the Western European powers are largely gone and only a few small remnants remain. The ideological empires seem also to be loosening. They are certainly not nearly so monolithic as they were twenty years ago. Moscow and Peking now vie for ideological leadership of the Communist world. Yugoslavia is communist but non-aligned and Roumania and Czechoslovakia are restless under the Soviet yoke.

The result of a situation in which there are vastly greater numbers of independent states, or states with a greater degree of independence, is that the pattern of political relationships throughout the world is constantly shifting, unstable and unpredictable. It is immensely encouraging that so many peoples have acquired far more personal and national freedom than they ever had before, but this very freedom may lead initially to dangerous tensions or violent outbreaks. In various corners of the world, peoples who have been under the dominance of an imperial power are struggling to establish a new equilibrium. Such is the case in Vietnam, Nigeria and Czechoslovakia.

Another aspect of the world situation which has come increasingly to the fore in the past twenty-five years is the crisis of underdevelopment. The problem has been there for a long time. In its present form it has existed at least since the industrialized nations of the West began their take-off into relative affluence in the 19th century. But the disparity has become vastly more acute in our time and both we and the inhabitants of the underdeveloped countries are far more aware of the problem through the efficiency of worldwide communications. The poverty-burdened majority of the people of the earth are increasingly conscious that we of the rich nations are still outstripping them in economic progress as every year goes by.

As I see it, two of the most important foreign policy questions facing Canada today are what we do about the issues of peace and war in parts of the world with which we formerly hardly concerned ourselves, and

what we do about the enormous disparity between rich and poor all over the world. We have long been closely concerned about events in Europe, and rightly so. We are an offshoot of European civilization; that is where the bulk of our population traces its origins, where we have very large economic interests and where the most immediate threat to our security lies. We cannot turn our backs on Europe but we are compelled to add new dimensions to our thinking about other parts of the world.

Canada has been drawn, partly by the accident of membership in the Commonwealth, into assisting in the struggle for economic viability of first India, Pakistan and Ceylon, and later other Commonwealth nations in Asia, Africa and the Caribbean. We have found ourselves grappling at the United Nations with the complexities of such issues as the Korean War, the Congo rebellion, Cyprus and the Arab-Israeli conflict in the Middle East. We were called to play a part in the International Control Commissions set up so hopefully in 1954 to supervise the settlement in Vietnam after France's withdrawal. We now have to decide whether we are to continue all or some of these involvements, to broaden out our interests abroad, or to concentrate on certain international functions and certain areas of the world.

Canada's contribution to international development assistance now amounts to more than \$300 million annually and we are pledged to increase it to 1 percent of national income. Our programme is a respectable one in size and effectiveness. But we have a lot of urgent questions to answer about our aid. Should we concentrate more of it in certain countries or in certain sectors of development? What should be the relative emphasis on grants and loans of various kinds and on trade concessions? As a middle power, are there special things Canada can do better than other countries? To what extent should we pool our efforts with those of other contributors? As development assistance becomes an increasingly important part of our international activities, questions like these become much more critical.

One new dimension that has been added to Canadian activities in the world in recent years is that of the active projection abroad of the bilingual and bicultural aspects of our nationhood. French-speaking Canadians now urgently seek to play a role in national and international affairs more in keeping with their weight in the Canadian population. The signing of the France-Canada Cultural Agreement in 1965 marked a major step in a conscious effort to represent the French fact in Canada more adequately in our external relations. As I have mentioned, for historical reasons we found ourselves fairly closely associated with the newly independent members of the Commonwealth in Africa and Asia. We were slower to develop comparable ties with the newly independent francophone countries, but we

are now rapidly expanding these relationships. A proper reflection in foreign policy of our bicultural character is vitally important in strengthening the unity of our Canadian nation. It is also an opportunity for Canada to play a greater role in the world.

An area in which our foreign policy has been unbalanced in the past is in the American hemisphere. Beyond the United States, we have been somewhat tardy in developing an active collaboration with the countries of the Caribbean, and even slower to seek out closer relations with the nations of Latin America. We should frankly admit that there has been a neglect of that part of the world in the thinking of most Canadians and seek to rectify that omission.

So too in our relations with the nations that border the Pacific Ocean. The imbalance in that respect, however, is not exactly a case of neglect. On the contrary, the western part of Canada, and especially British Columbia, has long had active trading and other relationships with Eastern Asia and the South Pacific. In recent years there has been a particularly great increase in our commercial exchanges with Japan. But this has been largely the reflection of a regional interest on the part of those areas of Canada which naturally look outward to the Pacific rather than to the Atlantic. What is now required is that we pay continuous attention to the Pacific as well as to the Atlantic as an area of national interest to all Canadians.

One important step that Canada could take in the Pacific is to exchange diplomatic representatives with the authorities in Peking. We and the rest of the world need to open all possible channels of communication with the government which is in effective control of China. That is why we have recently made the initial contact with representatives of the People's Republic of China to explore the matter of recognition and exchange of embassies.

Going beyond all of Canada's regional or functional interests is our concern to see the United Nations become a more effective instrument for international cooperation and for the achievement of the Charter goals of peace and security, economic and social jus-

tice and individual human rights. The U.N. is an imperfect organization because it reflects an imperfect world. But it is man's most ambitious effort to reconcile differences in the human condition and harmonize the actions of nations. We must look again at our national goals in the United Nations context and identify the changing circumstances of international life as they affect the functioning of the U.N. Then we must decide what changes in Canadian policies or techniques may be required as we make common cause with other countries in the United Nations and its Specialized Agencies.

The task for Canadians, as we review our foreign policies, is first to determine our own capacities, our own strengths and our own weaknesses. As a middle power, what economic, military and political resources do we have at our disposal and how can we best employ them in the interests of our own people and of the world community? We must also examine realistically the world around us and the changes that are taking place in it. In the light of those changes, should we concentrate more on one function and less on others, or more on one region and less on another?

I expect that the answers to these questions will result in some shift of emphasis in our international activities and some alteration in the methods by which we carry out those activities.

Because foreign policy is never static, we have already begun to bring about some changes. But I doubt very much that we will abandon completely any functional or regional activity, and I see no need to do so. We don't need to pull out of Europe in order to develop better relations with Latin America or the Pacific. Participating in collective security arrangements is not incompatible with assistance to developing countries or an active part in disarmament negotiations. We may be only a middle power, but we are a nation with the capacity to undertake a good many varied roles in the world if it is in our national interest to do so. The aim of Canadian foreign policy must be to strike the right balance of effort among those roles that are appropriate to our circumstances as a middle power and to the imperatives of the international situation.

APPENDIX SS

"NATO IN CANADIAN PERSPECTIVE"

A SPEECH

BY THE SECRETARY OF STATE FOR EXTERNAL AFFAIRS

THE HONOURABLE MITCHELL SHARP

TO THE

CANADIAN INSTITUTE OF INTERNATIONAL AFFAIRS

CONFERENCE

UNIVERSITY OF CALGARY, MARCH 1, 1969

Two Canadian Prime Ministers, Mr. St. Laurent and Mr. Pearson, were among the founders and chief architects of NATO. Twenty years later, under a new Prime Minister, Canada is reviewing its foreign and defence policies, and one of the key questions is whether or not Canada should stay in NATO. Within the last few weeks the British Prime Minister and the German Chancellor, meeting in Bonn, have re-affirmed their full support of the Alliance, and the President of the United States, at NATO headquarters in Brussels and in other European capitals, has renewed his country's pledge to stay in Europe and to stay in NATO. General de Gaulle, with all his distrust of what he likes to call "the American Hegemony", has kept France in the Alliance, maintains two divisions in Germany and, although he has withdrawn his forces from the unified NATO command, fosters the closest liaison between the French and NATO headquarters.

Why then is Canada, an outward-looking, internationally-minded country, closely tied by history, geography and national interest to the United States and Western Europe, the one country currently conducting a fundamental review of its role in the NATO alliance? First let me make clear that the review has not been undertaken for reasons of narrow domestic self-interest. Canada is very far from being a self-contained economy, our standard of living and our very ability to survive depend on a world-wide pattern of foreign trade. No nation in this position can turn inward upon itself and ignore its international responsibilities. To live and to grow, Canada needs a stable and prosperous world.

Regardless of any review, the whole thrust of Canada's foreign policy is directed toward the twin objectives of world order and world prosperity. This means that, for its own self-interest and its own self-respect, Canada must make its proper contribution to the maintenance of world peace and the raising of the

world standard of living. These are political objectives and are pursued in the United Nations and NATO, by means of other groupings such as the Commonwealth and the newly-founded Francophonie, and bilaterally with the nations of the world.

The pursuit of these political objectives involves military activity, which for Canada is not and cannot be a matter of national ambition but, rather, a contribution to keeping world peace, and foreign aid as a contribution to raising the standard of living in less developed countries.

The purpose of the current review of foreign and defence policy is not to question whether Canada should be engaged in political activity, keeping the peace and foreign aid. And it is not to question the value of NATO as such, for NATO is going for some time to come with the support of its European members and the United States, no matter what we do.

The review of our foreign and defence policies is designed to find out if we are serving our own interests best and making our most effective contribution to world order and world prosperity under our present arrangements. If not, these arrangements will be changed. Coming to NATO, the questions the review asks are the same; is membership in NATO in Canada's national interest? ; does membership in NATO represent an effective Canadian contribution to the maintenance of world peace?

I can't answer these questions for you today, since the Government has not yet arrived at any conclusion. I can, however, discuss with you the background against which the decision will be made and some of the considerations that will bear upon it.

The late forties was a critical period for the Western World. Wartime cooperation between the Western Allies and the Soviet Union had disappeared. In three

years, the U.S.S.R. had established political domination over five Eastern European countries and part of Germany together making up a population of about 100 million. the final takeover of Czechoslovakia also saw growing Soviet pressure on such countries as Finland, Turkey and Iran, and the blockade of Berlin. Canada, having seen two world wars explode out of European quarrels, saw yet another explosive situation developing.

Western Europe, weakened by war, feared both aggression from the powerful military forces maintained by the Soviet Union and Moscow-directed internal communist subversion.

The democracies of Western Europe had to find a way to protect themselves and the way of life they represented. Hopes that the United Nations might be able to provide such protection through universal collective security had soon been dispelled—in part by the indiscriminate Soviet use of the veto. This was the background against which NATO came into being, a pooling of resources by like-minded nations to protect a common way of life.

While the immediate threat which led to the establishment of NATO was to the Western European democracies, it was seen in Canada and the United States as directly affecting North American security. The lesson of two world wars had been learned, and we accepted that we could hardly remain uninvolved if a third such war should break out. At the same time, however, Canada shared the general feeling that it is possible to benefit by past mistakes; that, by taking the right action at the right time, it should be possible to prevent a war rather than have to fight it. Gradually, it came to be accepted that the effective action which was required could only be achieved on a collective basis. Mr. St. Laurent was the first Western statesman to express this conclusion, when he said on July 11, 1948: "We believe that it must be made clear to the rulers of the totalitarian communist states that if they attempt by direct or indirect aggression to extend their police states beyond their present bounds by subduing any more free nations, they will not succeed unless they can overcome us all."

All this was twenty years ago, and perhaps the most telling answer to the question of whether NATO has been worthwhile is to be found in the simple fact that since its establishment no further European countries have fallen under soviet domination—either through direct military intervention or by subversion. The nations of Western Europe have grown and prospered. In a period marked by violence and conflict in other parts of the world, Europe has enjoyed a unique degree of stability. NATO's success is often taken for granted these days, but this fact should not be allowed to detract from its achievements. Paradoxically, it is the fact of NATO's success that permits the luxury of questioning the need for it. I am often asked how one

can be sure that the twenty years of peace Europe has enjoyed is due to the existence of NATO. I suppose in the end there is no substantive proof, but I can tell you this. The question is one which is easily asked in Calgary, 6,000 miles from the Iron Curtain. But it is a question that simply is not asked by those who like their daily lives in the shadow of massive Soviet forces.

NATO is unique in the sense that it is the only example of a formal alliance that operates effectively in peacetime. Fifteen countries, despite their inevitable conflicts in national interest, have been able to continue to cooperate for two decades. This is a major accomplishment and something to celebrate. It also bears on the contention that the members of NATO have not in fact faced a real threat from the Soviet Union—that the danger they see is imaginary. If fifteen independent states have been prepared to make the effort required to maintain an effective alliance arrangement for twenty years, there must be a commonly perceived danger to which they consider a collective response the best answer. The danger is quite clear. The Soviet Union continues to increase and streamline its enormous military potential; its intentions remain uncertain; and there are unsolved problems in Europe which could ignite a nuclear war because they involve the vital interests of the super-powers. Canada cannot remain indifferent to this danger.

To deal with this situation, NATO has developed features which distinguish it from old-time alliances and make it a uniquely modern instrument of collective security.

First, it provides effective defence on a relatively economical basis. By a pooling of resources under a unified command rather than reliance on individual effort, the members of the Alliance help to ensure that in times of crisis or actual conflict there will be a quick and effective response. In an age of split-second timing and enormously complex and expensive weapons systems, the security which NATO provides to its members could not be attained in any other way.

Secondly, NATO is the instrument whereby the protection afforded by the United States nuclear deterrent is extended to Europe. By cooperating with the United States in continental defence, Canada contributes to the overall deterrent strength of the Alliance.

Thirdly, because the member countries can depend on United States nuclear protection, they do not have to produce or acquire independent control of nuclear weapons. By helping to limit the spread of these weapons, NATO contributes to the idea of "non-proliferation" and at the same time, within the Alliance, helps to reduce the possibility of nuclear war occurring by accident or miscalculation.

Fourthly, NATO enables West Germany to make an effective contribution to the defence of the West. Germany has the largest single military establishment in Western Europe, but all of its forces are integrated into NATO and responsible to NATO commanders. Germany has no General Staff of its own and no forces available to German commanders outside NATO. Because of the nuclear protection which Germany receives through the Alliance, she has been prepared formally to renounce the right to manufacture nuclear weapons on her own territory. This was done in 1954 when Germany entered NATO.

Finally, one of the most important characteristics of the NATO system is its provision of machinery for continuing consultation on military and political issues. This arrangement gives smaller members of the Alliance like Canada a chance to participate in the making of policy on a wide range of major issues of concern to us that we would not have in any other circumstances. But is this participation effective? It is often assumed that when lesser powers sit down with a super-power, all they can do is listen and agree. There are two super-powers in the world today, and they are very different. The U.S.S.R. operates in secrecy and by stealth without much, if any, regard for the wishes and views of its allies. The United States, on the other hand, is an open society with a government that must win elections to achieve and maintain power. While it may be in a position to dominate the Alliance, by its own choice it proceeds by consent and is susceptible to many-faceted influences from within and without its borders.

While NATO brings important advantages to its members, the alliance approach also involves both military and political obligations. On the military side, in addition to the guarantee of mutual assistance under the Treaty, there is an implicit understanding that each member will make an appropriate contribution to the overall military resources of the Alliance. In the political sphere, just as there is an opportunity to advance ideas and influence the actions of others in the Alliance, so there is a requirement to take views and interests of others into account. NATO operates by consensus and there is an expectation that, except in special circumstances, agreement will be reached.

One of the criticisms sometimes directed against NATO is that, besides placing these constraints on the freedom of action of individual members, it is a conservative bureaucracy, tending to perpetuate itself and unable to adjust effectively to changing circumstances.

In an organization made up of fifteen governments, there can at times be some difficulty and delay in coordinating views. At the same time, to the extent that there is a braking influence, it can have a positive value in restraining a member country from taking

precipitate action which could have an adverse effect on the Alliance as a whole. When one is dealing with issues of war and peace—and particularly nuclear war—this could be vital. Secondly, while progress toward political solutions may appear slow when approached in a collective basis, otherwise there might well be no progress at all.

NATO, like any large and complex organization has its imperfections. For each member the question is simple—do the advantages of belonging to NATO outweigh the disadvantages? Unlike the members of the Warsaw Pact, the members of NATO are free to withdraw if they should wish, but the fact that after twenty years none of them has so far chosen to do so suggests clearly where the balance of advantage or disadvantage lies.

Looking at NATO in today's world, we must ask ourselves—What is its role in the immediate future and where does Canada fit in?

It seems to me that a durable solution to the problems which continue to plague Europe and threaten world peace must contain two elements: a lasting settlement, on a generally acceptable basis, of the political issues of Central Europe, including the division of Germany; and the creation of some type of European security arrangement which would adequately meet the needs of all the countries concerned, both East and West.

The issues involved are complex and this goal will not be achieved quickly or easily. If any progress is to be made, there must be some mechanism to keep the peace and at the same time contribute to the creation of a climate in which movement toward a durable solution is possible. Does NATO satisfy these dual requirements?

NATO's main emphasis in the early years was on providing a defensive shield against possible Soviet aggression in Western Europe. This continues to be a fundamental purpose of the Alliance, but the emphasis is shifting as Europe's political and military circumstances change. The Alliance is now devoting its energies and attention to the twin objectives of *deterrence*, which is the prevention of war, and of *détente*, which is concerned with improving relations between the Eastern and Western nations.

The objective of *deterrence* is to prevent war. To do this, the Alliance must try to maintain a situation in which Soviet military adventure is obviously unrewarding and the likelihood of war breaking out in Europe is minimized. At the same time, if a conflict should occur, NATO must have the ability to respond effectively and prevent escalation to all-out nuclear war.

To achieve these objectives, NATO has developed the capacity for "flexible response". This requires NATO to have available enough military forces, both

conventional and nuclear, to convince the Soviet Union that any type of armed attack on its part would be unprofitable. Above all, the strategy of flexible response attempts to avoid a situation in which NATO would be faced with the stark choice of yielding to a conventional attack or resorting to nuclear war. It is also designed to contain an incident started by accident or miscalculation long enough to make a political solution possible without resort to tactical or strategic nuclear weapons. In such a situation, days or even hours could be crucial. This is why NATO is correctly described as a peacekeeping force.

Détente calls for continuing attempts by members of the Alliance—both individually and collectively—to improve relations with the states of Eastern Europe, including the Soviet Union. Obviously this policy depends on some reciprocation from the other side. The aim is to reduce tensions and replace them with an atmosphere of confidence and stability. In such an environment it is hoped that both sides would be able to develop and respond to initiatives designed to produce durable solutions that would make the existence of armed blocs unnecessary. In this sense NATO's avowed objective is to create circumstances in which the Alliance would become redundant.

The pursuit of *détente* will be a slow process, probably bedevilled by setbacks such as that which occurred in Czechoslovakia last year. Its success will be the sum total of the various individual and collective activities of the members of the Alliance. Much of the progress will necessarily have to be made through bilateral relations between individual NATO members and members of the Warsaw Pact. In this process NATO has an important function to perform in providing the machinery for coordinating the activities of its members. What one does could have important implications for the others, and close consultation is therefore essential. There is also scope for collective initiatives and the Alliance is already at work in this area. A specific example of such a collective initiative now being examined in NATO is the proposal for balanced force reductions. This calls for negotiations between NATO and the Warsaw Pact, designed to achieve agreement on the progressive lowering of military forces on both sides. The relative balance of military strength in Europe, which now permits a reasonable degree of stability, would be maintained at progressively lower levels. Early last summer, NATO proposed to the Warsaw Pact that discussions on this idea be initiated, and although the events in Czechoslovakia intervened, the matter has not been dropped.

Whatever Canada may decide, the Alliance will continue to be the mechanism through which peace in Europe is maintained and decisions are taken on the issues affecting the evolution of East-West relations and the solution of European political problems. We must decide if these matters are of real concern to us

and, if so, whether we have a better chance of influencing them in a favourable direction through continued membership in the Alliance or by withdrawing.

I appreciate that there are differing points of view as to the importance of developments in Europe for Canada and our ability to influence them. Because of this, I think the open debate we are having is highly desirable. For my part, I cannot escape the conclusion that what happens in Europe matters very much to Canada. Our interests there cover many areas—history, culture, trade and finance, to mention only a few. Perhaps the most fundamental of all, however, relates to the fact that it is in Europe that the vital interests of the super-powers are in starkest confrontation, so that there is the greatest chance of a conflict escalating into a nuclear war. Because of Canada's geographic position between the two super-powers, this was would be fought out above our very heads. This is why Canada has a direct, selfish interest in the prevention of war.

I am not suggesting here that we ignore our interests in other parts of the world, but simply that, in terms of priority, Europe and developments there must continue to have a major claim on our energy and attention for some time to come.

Last summer's events in Czechoslovakia illustrated dramatically the determination of the Soviet Union to maintain its grip on Eastern Europe. It is difficult to accept, however, that the urge for greater freedom and a better way of life now manifesting itself on the other side of the Iron Curtain can be indefinitely suppressed, even through the brutal use of force. With all the uncertainties inherent in this situation, the period ahead seems to call for a combination of vigilance and perception. Vigilance is needed to cope with the consequences for the West of further difficulties such as Czechoslovakia; perception, to discern opportunities that the inevitable process of change in Eastern Europe might provide to make progress on Europe's political problems.

Will Canadian interests in the future best be served through continued Canadian membership in NATO? One of the major concerns in our review of defence policy and related foreign policy considerations has been to establish whether there are in fact any better alternatives to NATO for Canada. We are examining this problem ourselves, we are seeking the views of other informed observers and taking account of the opinions we have received from the public at large. At the same time, a parliamentary committee is conducting its own review of many of the issues.

If we should decide that it is in our interest to remain in NATO, it will be necessary to take account of the responsibilities as well as the benefits that go with such a policy. I mention this because there have been suggestions recently that, by withdrawing from

the Alliance or maintaining only nominal membership, Canada could have most of the benefits the system provides without paying for them. I doubt that this approach would appeal to many Canadians or that the benefits would in fact flow so readily. This is not to say that a decision to stay in NATO would mean that we stay for another twenty years, or that our military contribution will remain the same.

Governments are often accused of losing touch with the wishes and aspirations of the people, and the

Government of Canada has heard such accusations often enough. But there is one issue on which the Government and the people of Canada stand foursquare together: the paramount determination to do our part to prevent war. If Canada decides to stay in NATO, it will be because we are convinced that in NATO we can effectively help to prevent war. If some other course is taken, it will be because we think such a course will better enable us to help to prevent war. No other consideration, however seductive it may appear, will be permitted to deflect Canada from its supreme objective, the prevention of war.

MINUTES OF PROCEEDINGS

Thursday, March 6, 1969.
(49)

The Standing Committee on External Affairs and National Defence met at 11:10 a.m. this day. The Vice-Chairman, Mr. Ryan, presided.

Members present: Messrs. Allmand, Barrett, Brewin, Buchanan, Cafik, Carter, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Legault, Lewis, MacLean, Marceau, Nesbitt, Nowlan, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Stewart (*Cochrane*), Wahn, Winch—(23).

Also present: Mr. Roberts, M.P.

Witness: Professor Stephen Clarkson, Department of Political Economy, University of Toronto.

On motion of Mr. Guay (*St. Boniface*),

Resolved,—That Professor Stephen Clarkson be reimbursed for expenses incurred in the preparation of his advance presentation to the Committee, as supported by a detailed statement from the firm involved.

The Clerk distributed cheques, documents and travel information to be used on the European tour.

The Vice-Chairman made an opening statement concerning the witness for this morning's sitting, and dealing with the Committee's itinerary in Europe. He noted that the Chairman will issue a press release about the European tour.

The Vice-Chairman introduced the witness and Professor Clarkson made an opening statement.

Members questioned Professor Clarkson about his views on Canada's defence and foreign policy roles.

The Committee agreed to print Professor Clarkson's advance presentation, including the summary and supplementary note, as an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix tt*)

The Vice-Chairman thanked Professor Clarkson for his testimony.

The Committee adjourned at 1:10 p.m., to the call of the Chair.

Hugh R. Stewart,
Clerk of the Committee

EVIDENCE

(Recorded by Electronic Apparatus)

Thursday, March 6, 1969.

● 1110

The Vice-Chairman: Gentlemen, we have a quorum. Will the meeting kindly come to order.

First of all I would like a motion that Professor Stephen Clarkson be reimbursed for expenses incurred in the preparation of his advance presentation to the Committee which is supported by a detailed statement from the firm involved.

Mr. Guay (St. Boniface): I was going to suggest that we wait until he is through.

The Vice-Chairman: Mr. Guay, you can see that there are some supplementary papers on the table that he has had to prepare in an emergency.

Mr. Guay (St. Boniface): I so move.

Mr. Winch: I second the motion.

Motion agreed to.

The Vice-Chairman: This morning the Committee will be hearing testimony from Professor Stephen Clarkson of the University of Toronto.

I would like to point out that Professor Clarkson will be the last witness to appear before the Committee in the present phase of its investigation and prior to its departure for Europe.

I wish to make one announcement about the trip. The Clerk will circulate for the private use of members some information of a practical nature and such details as we now have of the program which the Committee will be following in Europe. We plan to circulate a full itinerary to members of the Committee on the aircraft, by which time we should have more detailed information.

The Chairman proposes to issue tomorrow noon to the Press Gallery a press release indicating the aims of the Committee's visit to Europe in terms already set out in this Committee, giving such details of the itinerary as we have at that time and a list of the members of the Committee.

Professor Clarkson has submitted in advance a very comprehensive written statement entitled *Canada's Role in Long-Term World Perspective: A Proposal for a New Initiative*. He is prepared to give an opening introductory statement on Canada and NATO in the light of the framework he developed in his written statement. I understand that Professor Clarkson is not an advocate of complete withdrawal from NATO but that he believes Canada should develop a new approach and adopt a different policy with respect to participation within the organization.

Professor Clarkson is probably known to you as the Editor of the book *An Independent Foreign Policy for Canada*. His biography has been circulated and I shall therefore not give details of his past experience.

Professor Clarkson, would you now like to make your opening statement.

Professor Stephen Clarkson (University of Toronto): Thank you, Mr. Chairman. Might I say, to start with that I am delighted to be here for a special reason. Thinking of the Justice Minister's speech on Monday, I speak with some trepidation as someone under fire from both sides: On the one hand the Justice Minister attacking us professors for taking part in public policy discussions and not doing our work in the university of keeping the students off the streets and, on the other hand, the students attacking us for supporting the American empire by taking part in this kind of consultation. I am delighted that this Committee sees fit to still call on independent observers of national policy problems for consultation. More seriously, I am delighted because, in my view, having the House of Commons seriously deliberate in Committee problems of Canadian foreign policy is an extremely important addition to the input of public opinion into the foreign policy-making process which cannot but be a major factor, I would hope, in future foreign policy-making.

I apologize for your not getting the two page summary of my brief. Actually you should have received it with the actual statement itself. But it is there. That is why I thought I would take 10 or 15 minutes and just provide an outline of my paper for those of you who have not had time to read it.

[*Interpretation*]

And I would also like to excuse myself to French speaking members, for having been unable to submit my report in French. I had 5 days' notice only and did not have time enough to do so. I apologize for this, and all the more so as one of the main aspects of our foreign policy review is the bi-national character that our external policy must have. I hope that we will be able to discuss that today.

[*English*]

What I thought I would do then is simply give in rough outline my presentation which is really in three

● 1115

parts. It is, as I see it, the foreign policy problem under review, secondly, the basic analysis within which I think one has to approach a foreign policy review and, thirdly, the policy conclusions and what my proposal is.

First, there is the problem in general. It seems to me that in a total review of Canadian foreign policy what is at stake is Canada's role in international affairs for the next twenty years. There has not been such a fundamental review and one can only assume that the amount of effort that goes into this review now will not be repeated in the near future. So what is at stake is Canada's role in the next at least 10 and probably 20 years. It is rather like the original NATO re-assessment of the creation of NATO 20 years ago. I think this is extremely important because what is therefore at stake is the process of nation building in Canada over that period ahead of us. In my view our foreign policy is intricately linked into the whole network of Canadian national policies and so it cannot but affect our development over the next twenty years, which is why the bi-national character of it I think is so important. It seems to me that this is vital because the foreign policy review has become the focus for testing the practice of participatory democracy. The involvement of this Committee in a very direct way into this review makes it crucial, I think, that its report be a significant factor in the government foreign policy review. It amazes me that you will be able to go to Europe and, as well, write your preliminary report before the 26th. I wish you pleasant writing in Europe, because I find it difficult to write things quickly and I do not know how a Committee of 30 is going to attend to this task. Still it is extremely important and I certainly encourage you in this effort.

In terms of the problem as a whole, I think we can say that there is a real opportunity for Canada to re-assess its foreign policy. This is not an empty exercise because of the international situation which

is at a point where our roles can be re-assessed. I think also it is at a point in political time where a re-assessment makes sense. There is a new leader of the government, Mr. Trudeau, who has announced repeatedly since the day after he was nominated leader of the Liberals party that he wanted to re-assess Canadian foreign policy. This message has got across to our Allies in NATO and to other countries. So there is an expectation of change and I think this is the factor that makes the credibility of a foreign policy change genuine. I think also the fact that Nixon has taken over in Washington and has made clear signs of reappraising certain policies such as aid—even his western alliance policy—makes it still appropriate to think of a significant reappraisal of Canadian foreign policy not being necessarily in conflict with an American policy that is itself under review. I will come back to that a little later.

Another point on the general side is the danger that I think you in this Committee face. That danger is that you have to make a decision on NATO within the next couple weeks or whatever it is before your March 26 deadline, before Mr. Trudeau meets Mr. Nixon and before the April meeting of the NATO powers in Washington. The danger is this. The whole principle of the foreign policy review is to re-assess Canada's role

● 1120

in the world from fundamental principles, and from that fundamental analysis come down to the particular policies and decide what they should be. But this deadline is forcing you to make a decision on a particular policy which turns the whole process on its head. If I have anything to say to you today, it really is to urge, despite this deadline, having to make a decision on NATO quickly, that this should be done within the context of a general analysis of the world situation now and over the next ten years and of Canada's national interest and how it fits into this long-term view of things. The danger is that if one makes a decision on an important but single policy that will implicitly be making assumptions about the long-term prospect, about Canada's national interest. If those are not thought through the decision made on the particular NATO policy will necessarily affect all the other possibilities. You will be locked, with whichever choice it is, into a whole series of logical conclusions from that. So the fact that you are faced with this particular deadline makes your whole analysis of the total situation extremely important, which is why I would like to go on to sketching my analysis of this and make the recommendations that I do in the paper.

Also, there is the basic analysis from which a particular decision on a particular policy would be made. It seems to me clearly that one has to look at the world situation—the world situation as it is now and as we can foresee it developing over the next ten

years—and examine what are the basic threats that face us and what are the basic problems. I think very simply there would be a significant reduction of the communist threat, especially in west Europe as a result of say the success of NATO, a continued and very real threat of nuclear holocaust first of all between the two super powers and then increasingly as proliferation is allowed to take place or does take place between the middle powers, which will be a continuing threat that we have to consider very seriously.

Then there is the problem of instability in the third world, if you like, or, more simply, poverty in the third world and the political and military instability that that implies. I think what we have to envisage is continued local wars in the developing countries, including the near East, Latin America, Africa, Asia, as being the major direct source of instability and threat to world peace, with the nuclear holocaust as an overriding general threat. That then is the international situation over the next ten years, which seems to me to make sense—the communist threat stabilized really because of the split in the communist camps. Even within those two basic blocks there are major splits between Hanoi and Peking between Romania and the Soviet Union, and so on, making the poverty of the third world the major source of instability in the next decade or two.

Now in terms of general analysis, what are Canada's national interests, thinking of the impact of Canadian foreign policy on the national interest? It seems to me that basically it comes down to one problem. Everyone can elaborate on it but it is really the Canadian identity, the survival of the nation of Canada as a country, as a political entity. That, in my view, really means the establishment or the continued establishment or the development of a national identity that has meaning for the French Canadian, the English Canadian, the new Canadian and the original Canadian. The importance of foreign policy in this I think is very real, given the symbolic value that foreign policy has as a kind of international affirmation of the national personality. And if you take the extraordinary degree to which the public now is educated in foreign policy matters by television, the fact that we have hour long specials on Biafra or the Berlin crisis, is just as immediate as a riot in Chicago. The potential importance of Canada's role internationally is very great, I think, in affirming and developing the sense of national

[Interpretation]

In other words, to repeat, let us note the crucial and fundamental importance of external policy as an affirmation of Canadian identity to support the development of a Canadian bi-national state.

[English]

Now what this analysis of the world situation and the national interest implies to me is that one has to think of the review of Canadian foreign policy in terms of proposing a vision of Canada's role in the world for at least ten years. One has to project what we want to do in the world and then work back to a particular policy.

I think—I did not have this in my paper but I have added a couple of pages that I think you also have in front of you—one should start with a conception of what Canada's role in the world can and should be. I would say that in the past twenty years, without making any necessary pejorative judgment, it has been essentially a defensive role—defensive in the obvious and literal sense that the major priority has been NATO and spending on defence. If you look at the amount of money we have spent over the past twenty years, internationally, the bulk of it has of course been on defence military spending and a very relative small part on other foreign activities such as aid. And it has been defensive in the second sense in that we have towards the United States basically a deferential attitude. The US relationship has been rather one way, especially in the first ten years of the postwar period, when we were thoroughly in support of American foreign policy, decreasingly perhaps in the last ten, but always rather worried about the threat of retaliation if we did anything that the Americans did not like.

Without wanting to get into a discussion of the merits or demerits of that, I think what is needed now, and what is possible now, is a conception of Canada's role in the world that is creative, active and positive, one in which Canada, because of its rather unique position—and I say this really because this underlines the importance of Canada's unimportance as a major world power—should think in terms of taking the lead and taking the initiative in foreign policy matters in order to be a kind of experimental country for American foreign policy. I am thinking for instance of China, I am thinking of our role in Cuba, our possible roles in Europe, and especially in terms of aid to the developing countries. Canada can take the initiative and it should think in terms of being much more active and creative in its international role.

Now my ten-year strategy is a very simple one, and it starts really from a budgetary position. If—these are inaccurate but general figures—one takes the current foreign policy expenditures of Canada as

● 1125

identity. This means, in terms of national interest, that what is crucial in thinking about our foreign policy review is that it be integrated and coherent with the whole network of national policies that are developed. One cannot think of foreign policy, in other words, separate from our policy towards foreign investment, our policy towards regional development or our policy on biculturalism.

being about 2 per cent of the gross national product on defence and about .5 per cent on aid—it is not quite .5 per cent—project that forward ten years and simply switch those expenditures so that by 1980 we are talking in terms of Canada spending 2 per cent of its gross national product on aid development expenditures and .5 per cent on military expenditures, one can envisage a really significant shift of emphasis of Canada's role in the world. This would mean that Canada would become in ten years one of the great aid powers—on the assumption that the Americans are decreasing their aid, and that the Soviets are decreasing their aid, relatively. Most western powers are decreasing their aid at the moment; perhaps with Canada's example though they might increase. But we should think in terms of Canada doing something extremely significant here because Canada does have a very favored position as an aid-giving power, simply again because of its unimportance, because of it not being a threat to the

● 1130

developing countries. This presumably would be in the areas where Canadian aid would be most effective. I am thinking of African countries, I am thinking of Francophonie where, again, if one wanted to develop bi-national foreign policy—si on veut

[*Interpretation*]

If we wish to create an external bi-national policy, the role of Quebec and French Canadians is obviously special, fundamental. A truly increased aid policy to countries of the Third World and especially to member countries of the French-speaking world would give our foreign policy an obviously bi-national character.

[*English*]

So the aid policy would be very significant. I think the military policy would also be significant if it were conceived of as a highly mobile, highly flexible peacekeeping force that relied basically on fairly light equipment, the heaviest equipment being mobile smallish tanks, I suppose. This would not mean that Canada's potential role in Europe would be negligible because peacekeeping would obviously include Europe in times of crisis. They would be basically stationed in Canada and available for peacekeeping activities where needed, and needed really means now where invited by the warring partners or when there is sufficient international agreement that foreign troops can come in. It would have a secondary role, I think, in terms of disaster relief, which is one of the major problems in the third world today. A disaster takes place, the whole development plan simply gets destroyed and instant relief is needed—in other words, a small-cost, relatively small-cost but still significant peacekeeping force with a major effort on foreign aid.

How does one implement this strategy over a 10-year period? You simply work backwards up to current policy. You think in terms of the transitional period in which in Europe, for instance, it would be a result of negotiation with allies, with the European powers taking over an air base when we have vacated it once the atomic strike force became obsolete. A transition in 10 years or 12 years does give a significant amount of time so it is not a question of suddenly pulling out, of abandoning allies, of getting out right away, but one of negotiated gradual shift from the present policy to a clearly expressed future policy which allies know about because it has been made clear.

There is one other point that I will make. It is part of my proposal but was not really spelled out in so many words in my paper. It is that Canada would now not say in statements at the end of March and April, "Yes, we are in NATO", or "No, we are not." It would call for a re-assessment of NATO by the NATO powers. It makes so much sense, if Canada has already spent a year on its foreign policy appraisal and it does not quite yet know what precisely its relationship should be with the current alliance which clearly has certain disadvantages to it, and obvious disadvantages at the moment for certain NATO powers like France, that we should call now for a re-appraisal by NATO itself of the organization. We are, after all, the powers that took the initiative to set it up 20 years ago. It has lived its 20 years as envisaged in the treaty, and it is a logical time to call for a re-assessment of the situation because obviously it has achieved its major goals in containing the Communist push westward and it has stabilized western Europe. Clearly re-assessment now needs to be made. In fact all the individual NATO powers are themselves re-assessing. Britain is reducing its military expenditures. It is an obviously good time to do this. And it might mean that in the withdrawal to Canada of Canadian troops the European security forces were re-organized as a European force with some kind of American nuclear hood-up that would change the name perhaps and the nature of the NATO agreement so that Canada would no longer be burdened with the identity of being part of the Western anti-Communist—this old-fashioned alliance—and would be part of a new one.

I conclude in the paper with certain remarks about whether or not this would be acceptable as a policy to our allies. Two points I think are important. One is our French relationship.

● 1135

[*Interpretation*]

It would seem to me that one of the most important aspects of a new Canadian external policy would be a renewal of our relationship with France. And the fact

that Canada is busy re-examining its participation in NATO and that it indicates clearly that it will change its relationship with NATO, will help Canada to renew its links with France and this will also give Quebec, as its role as an intermediary between Canada and France gradually gains importance, the possibility to act and to influence French policy.

[English]

And the second point I would make in terms of acceptance of this proposal is that I think for the United States of America Canada can play an extremely important role as a kind of kiteflyer or bellwether, whatever you want to call it. We are obviously doing this now with China and with problems that have been intractable for the last 10 years such as the Berlin question and divided Germany. Canada's calling for an opening of negotiations on these problems could be an initiative that the Americans cannot take themselves because of their highly involved commitments with the Germans and because of the internal political situation in the States, where as coming from their good friends the Canadians, this could be sold to American public opinion as something that the Canadians want to do as they are there, they are at least honest and they are doing this in good faith, and so negotiations can be started if they are started by an unimportant country, and got going.

So I think we should think of this new 10-year foreign policy of Canada in terms of playing a constructive and creative role, especially in relation to American policy.

Finally, my last point about acceptability is that it seems to me that such a foreign policy approach would be highly acceptable in Canada. It would, for one thing, re-establish Canada's initiative and role of creative policy formation in the world. I do not want to speak as any kind of expert on the opinion of youth in Canada, but my contact with students and those who are highly active, which is an ambiguous word, but those who are highly active in Canadian politics, leads me to think very strongly that such an initiative would be extremely acceptable; or to put it negatively, if we appear locked into NATO old style, this will be a great disappointment to that section of the Canadian population that will be running the country in the seventies and eighties when the results of this policy will become known.

The Vice-Chairman: Thank you, Professor. I have a list of questioners—first Mr. Buchanan, then Messrs. Lewis and Nesbitt. Mr. Buchanan.

Mr. Buchanan: Thank you, Mr. Chairman. Professor, you suggest that we should discuss with our colleagues in NATO procedures and processes whereby the role of, not only NATO but Canada's role within NATO, can be altered. I would comment that I hope any

decision which this Committee might make during the next two or three weeks, assuming it is to maintain the connection, which I gather you support, does not in any sense preclude the fact that we could continue very actively to negotiate and discuss the changing role of NATO and our changing role within it. I certainly hope that is the case. The second thing is that President Nixon, during this recent tour of his, made very strong representations that he hopes that this type of negotiation will be done on a consultative basis. Yet there is, I think, a lingering fear amongst the other NATO partners that in the past, while theoretically the Americans may have given lip service to this theory of consultation, in fact the roles and the strategy have pretty well been imposed by the American hierarchy. Do you feel there is really any genuine likelihood that there is going to be a change in this sense, that the Americans are going to relinquish this and be willing to subordinate their own national interests to the over-all interests of NATO?

● 1140

Professor Clarkson: Is this a question of whether the Americans would genuinely discuss, or if we called for re-appraisal whether they would?

Mr. Buchanan: Right. How genuine would the consultative process be?

Professor Clarkson: How genuine was it in 1948 and 1949 when it was set up? It seems to me there was major negotiation discussed between those powers that became the NATO alliance.

Mr. Buchanan: Right.

Professor Clarkson: And an explicit call for a re-assessment of NATO?

Mr. Buchanan: Which is what you are advocating we do.

Professor Clarkson: Yes. There would be no alternative but for the Americans to take part in discussions with the French and the British and the Germans and us. They clearly have the predominance of power and that factor would give an extraordinary weight to their opinion. But if the discussion gets on to the floor and it is really a multinational discussion of the future of the alliance members, that makes the opinion of Denmark and Belgium and Holland important because every link of the chain is important.

Mr. Buchanan: Basically what you are saying, then, is that you do feel that as long as we are successful in getting the old role of NATO re-opened and re-assessed there will be genuine consultation. This is what concerns me somewhat.

Professor Clarkson: I do not see that as a problem.

Mr. Buchanan: There is a second matter that concerns me. You mentioned in your paper, I believe, that you feel the threat to world peace in the future is going to become more a problem from the third world. One of our other speakers two or three evenings ago suggested that he did not think the third world would be a threat to our peace in the sense that unfortunately they would not develop the capacity to do harm generally other than within the borders of their own countries.

Professor Clarkson: I did not mean a threat to Canada directly, a territorial threat to Canada. I meant if one were asking what are going to be the major forces of military instability in the world, they are those wars going on in the Near East and in Asia and in Africa at the moment because they involve us; because once a country gets to a certain point the big powers can get involved themselves, so that any war going on anywhere in the world, in my view, is a threat to our security.

Mr. Buchanan: Right. All I would say is that unfortunately I feel that people have a tendency—for instance, the Canadian population's interest at large would be far greater in the area of aid if they felt there was a genuine threat to Canada's own security. It is fortunate in one sense, but unfortunate in another that the third world is not likely going to be able to thrust its problems vigorously upon Canadians and upon the developed world.

Professor Clarkson: Well, I guess that is our role, yours and mine, to make Canadian people aware of this.

Mr. Buchanan: How one does that more effectively, of course, is the problem. Thank you, Mr. Chairman.

The Vice-Chairman: Mr. Lewis.

Mr. Lewis: Professor Clarkson, I read your paper as well as your additions this morning, and I want to say by way of preface that as you probably can guess my colleagues and I have a great deal of sympathy with probably all, certainly most of what you say. I should also like to congratulate you on a very thorough and profound analysis of the situation. But what concerns me about your paper as well as about your introduction is the question of where you start this long-range redevelopment of Canadian policy—the switch-over from the larger proportion of our income being spent in aid as against the proportion spent on defence; the start of a creative role by this country. Where do you begin? It seems to me that you begin with some of the institutions in which you are now involved. And that takes me to NATO.

My first question is, Professor Clarkson, is there really any very useful element in your suggestion

• 1145

that there be another re-appraisal of NATO's role by NATO? We had three wise men about a decade ago, we had Harmel a couple of years ago, and before Canada makes a suggestion that the role of NATO should be re-appraised, we ought to know what we think the role of NATO should be. Therefore I ask you, sir, what should be the role of NATO in the present circumstances and in the foreseeable decade, with the reduction of the Communist threat to Western Europe? What should that role be?

Professor Clarkson: Mr. Lewis, you are right; one does have to start somewhere. I think in the absolutely immediate future it would be very unfortunate if we had to say, "Yes, we will stay in the current NATO", or "No, we are getting out", but my first point was that this would be unfortunate because there are alternatives, and in calling for a re-assessment of NATO, my idea is that this re-assessment would take place in terms of new factors. One new factor would be Canada's having said that our long-range policy is to make a significant shift in the way we spend that same amount of our G.N.P. in international affairs. That already changes the point of view in the situation.

Mr. Lewis: I am sorry. That really is going at it backward; is it not? In the present European situation, with or without Canada, for the moment, what should the role of the organization NATO, which is no longer necessary, if I understand you correctly, to meet a strong Communist threat in Western Europe? And, therefore, consequential upon that answer, what should its military posture be?

Professor Clarkson: Again I am going to answer you slightly indirectly. If one is talking about the European security problem I think Canada's priority, as I said in the paper and as I mentioned in my summary, should be on the economic and political consolidation of Europe; and the military implication of that is that yours, as a third force, would basically look after its own defence, if one is thinking in terms basically of conventional defence; and that the nuclear arrangement, which is still basically as between super powers, would be coordinated with that. Whether that be a new organization, or a revised NATO, is a question of organization to be determined, but conceptually it seems to me that the Europeans should look after their own defence; that Canada has a strong peace-keeping force that can come to their aid if needed; that there is joint military consultation at the planning level; but that NATO, as it is now—and I do not think it would necessarily remain the same—is up for re-appraisal, it seems to me, in terms of Canada spending its major

amount of dollar resources on aid. If you are asking me to be more specific on what kind of consultation there should be, you know, as one gets into the details of that one cannot. Does that answer your question?

Mr. Lewis: Yes; subject to this further question, that if the objective ought to be—and I am inclined to think you are right—that the West European nations organize their own defence in an integrated way, why are you disturbed by the possibility of Canada withdrawing from NATO?

The NATO organization consists of European countries plus the United States, plus Canada, and that is it. If you come to the conclusion that it is time for the European countries to organize their own defence, supported by the nuclear capability of the United States, which is really what you are saying . . .

Professor Clarkson: Yes.

Mr. Lewis: —and which does not need to be stationed in Europe, with the present nuclear type of capability, why are you so disturbed by the forthright conclusion—I may, or may not, share it; I am asking you the question—that in these circumstances Canada should say it is withdrawing from NATO, or at least withdrawing its military contribution to NATO and

● 1150

bringing it back home in the form of a mobile force?

Professor Clarkson: I am not disturbed by the prospect. I did not want to give that impression.

Basically, I think I was making a political judgment, that NATO is a highly emotional issue for Canadians, and that to make a very abrupt decision—an announcement—that we are getting out of NATO would upset many Canadians who would not be upset by a policy that would have the same implication seen over a longer period; and that we make the organizational question a technicality in terms of the long-range shift of emphasis. If it meant that NATO would stop in a year, you know, and one could simply re-negotiate the new European defence community, with Canada having a separate role based in North America, that is fine; but that seems to me a problem of detail to be worked out.

Mr. Lewis: It is not detail, with great respect, Professor Clarkson. If I may be frank, I think it is a kind of academic shuffling that does not impress me.

Professor Clarkson: I do not think so.

Mr. Lewis: No one suggests that on a given date, say, April 10 next in Washington, Canada would say, “As

of tomorrow we are out of NATO.” In any kind of contractual arrangement an honourable nation does not act that way. Therefore, what we would do on April 10, in terms of your presentation to this Committee, would be to announce to our allies in NATO that it is our intention to withdraw at least our military commitment to NATO and to bring it back home in a year, or in two years, starting to reduce it now.

That is a declaration of policy. Obviously you do not do that sort of thing overnight with allies; you do it in terms of a year or two. Would you have any objection to this Committee reporting to Parliament the desirability of Canada making that declaration of policy, which I may say seems to me to be the proper declaration of policy at this time?

Professor Clarkson: Yes, that makes perfect sense to me. In a sense, we are agreeing. You are saying we would announce that we were planning to withdraw our troops to Canada, in terms of a re-organization of their potential. By that we would not be denouncing the organization but be changing our policy within it. That does, however, imply a re-assessment of the organization itself, and it is making the technical nature of the organization secondary to the change of policy.

Mr. Lewis: Not quite that, of I may disagree with you again. You can have conceptually—and it is very difficult to put in absolute terms—two alternative roles for an organization such as NATO. You can have an essentially defence role, which has been the posture of NATO until now, or you can have a negotiating role with the Warsaw Pact powers—whether the entity means anything or not—or you can have a combination of the two; but in none of these roles, according to your analysis with which I agree, is Canada’s direct participation necessary.

Therefore, when you say that Canada is withdrawing, assuming that that is our policy, you are not necessarily urging a re-assessment of the NATO role by the European powers; you are merely leaving it to them to make the decision on the extent to which they want a defence role, the extent to which they want a negotiating role and the extent to which they can reconcile the two.

I do not see why Canada’s withdrawal from NATO, in terms of its military contribution, in any way affects the role which the European countries now responsible for their own defence may decide upon. Is that not right?

Professor Clarkson: Yes; and that does imply that the European powers themselves, once they had been reorganized, would re-think their own defence operation.

Mr. Lewis: That leads me to my last question on this point. Is it not a fact, both from history and, I think, from *a priori* logic, that so long as the West European countries can persuade North American countries to be physically with military forces in Europe they will like it, because it gives them a greater sense of security; because it reduces their military commitment; and because they can make political conclusions from that situation. Therefore, ● 1155

if you are ever going to make Western Europe self-reliant in defence terms surely you have to say that it is your decision to get out from the military contribution and not wait for them to ask you to get out, which they never will?

Professor Clarkson: Yes, I think one should be clear and say that we no longer feel that we need subsidize European defence costs in those terms, and that we are going to spend our defence money on basically a kind of a mobile peace-keeping force that would be available in time of need in Europe, as well as elsewhere; that Europe is re-established economically and some countries are almost better off than are we in economic terms; that there is no longer any economic need to subsidize European defence; and that from a basically political point of view we prefer Europe to look after its own immediate defence problems. Surely that could be made clear without being defiant, or aggressive, or unfriendly.

Mr. Lewis: Certainly.

Professor Clarkson: It can simply be in terms of our re-assessment of the world situation and what we plan to do.

Mr. Lewis: I want to ask you two or three questions about the nuclear threat, but Mr. Brewin has a supplementary question, if you will permit it, Mr. Chairman.

Mr. Vice-Chairman: A supplementary, Mr. Brewin?

Mr. Brewin: Mr. Clarkson, I understand you to suggest that not only should Canada have a changed role in NATO but that NATO itself should be changed in its role. I presume that role would be to negotiate a détente, or a reduction of arms, in Central Europe, and other matters of that sort. What is your opinion of NATO as a credible or suitable instrument for that purpose? I am inclined to think it may be, but I would like to hear your view on it.

Professor Clarkson: I have rather contradictory views on that. I think to some extent there is a credibility in NATO negotiating with the Warsaw Pact if one is wanting to get a *quid pro quo* for a return of Canadian forces from Europe in terms of

some kind of reduction of Warsaw Pact forces. At that level two organizations that are mutually self-supporting really can talk to each other. It is not convincing to me that NATO can play a constructive, long-term negotiating role with the East European countries, because it has in open view such an aggressive image. It is so much linked up with the German threat for East Poland, Czechoslovakia and the Soviet Union that I do not myself think it is an appropriate instrument for political negotiation.

I can see it relative to military agreements on the withdrawal of troop levels in West Germany, as a whole, compared to East Germany, as a whole. On the military point perhaps it still has a function, or for the re-establishment of some military co-ordinating body in Western Europe with the United States. But I think one can say that without saying that NATO should be the instrument for political negotiations on such a thing as a fundamental German settlement. Does that answer your question?

Mr. Brewin: Yes.

Mr. Lewis: To follow that up, would not the credibility of NATO even as a negotiating instrument be stronger if the North American countries were not members of it and if you had a West European alliance facing an East European alliance?

Professor Clarkson: Credible to whom?

Mr. Lewis: To the East Europeans.

Professor Clarkson: Well, I think we are putting the scenario quite far ahead. It would achieve a reduction of the threat perceived by the East European countries from the West, so long as it did not take place in such a way as to increase the German threat, from their point of view. That, I think, is the major danger. In negotiations the juggling of factors is a very delicate matter, and that is clear; so I do not see focusing on NATO as a sufficient answer to the total European question.

If the military problem is now less important, but the political problem remains the fundamental factor in the instability in Europe, the lack of solution of the German question—which justifies both NATO and the Warsaw Pact—is clearly the root cause of the insecurity.

The Russians are traumatized by Germany, there is no doubt. I was in Moscow this summer. One is still shown examples of German destruction of this palace, or that building, or that city. It is on their minds, and on those of the Poles and the Czechs, also. This is the root cause of the problem in Europe.

● 1200

Mr. Lewis: I agree. I was on a parliamentary delegation to Poland about a year and three-quarters

ago. The Poles' fear of Germany is very real. Perhaps I may take just two or three minutes to ask you this question: In view of your, in my opinion, correct analysis that the real threat is the nuclear cloud hanging over the world, where is Canada's position vis-à-vis the United States in that context?

Professor Clarkson: I think it is a most important factor and I think Canada, in terms of an active and creative foreign policy, can really play a role in working towards arms control and the denuclearization of certain zones. For instance, if our atomic capability in Europe ended, that in itself would be a contributing factor. If we could make—and this gets on to the NORAD problem—our participation or our relationship with the United States in North American defence one aimed at arms control and limitation with a view to denuclearizing the Canadian space, in my view, this would also partially contribute to reducing the mutual threat felt from the Soviets and the Americans. I think the major danger that the world now faces is that the United States is on the brink of engaging in another whole round of the arms race; the antiballistic missiles, the multinuclear warhead missiles and the M.I.R.V. This is a new generation that they still seem to be hesitating on but are on the point of engaging in. I could conceive in this 10-year strategy—and Canada's relationship with the United States on this matter is one of strong discouragement of this step being taken—of Canada making certain offers to the United States and also to the Soviet Union that our states would be denuclearized, and while it is only one factor among many others because obviously all the ocean space is still open to nuclear submarines, I can see their making that kind of contribution to a reduction of world tension and I think that is quite compatible with American defence planning, as long as it becomes clear that Canada wants to do this kind of thing.

Mr. Lewis: Does that not lead to the conclusion, in addition to other reasons that have been raised, that Canada should end the NORAD agreement?

Professor Clarkson: I am much more flexible on the actual organizational form of things than you are, perhaps, but I can conceive of Canada still being in a NORAD, or some kind of North American defence agreement, but its contribution would be quite different. Our contribution would be in talking with the Americans on how to reduce the arms level in North America in such a way as not to undermine their security, and also in a balanced way with the Soviet Union, which is obviously their threat, in order to achieve a downgrading of the tension. I am not against being in clubs but I am very much in favour of one's defining one's role in a club, one's membership, in a creative fashion appropriate to the conditions of the time, and I think we should be in some kind of

close communication with the Americans on defence matters but in a way that makes it clear to them that we think our own security is threatened by being an alleyway for nuclear ballistic missiles.

Mr. Lewis: Could you leave your flexibility alone for one minute to answer the simple question as to whether in the present kind of NORAD your analysis does not lead to the conclusion that Canada should withdraw from it, whatever other defence discussions may take place with the United States?

Professor Clarkson: Again I am going to respond the same way. We could be in it or out of it but I think our role in it, if we stayed in, would be quite different and it would be aimed at arms control in North America.

Mr. Lewis: It would not be the present NORAD, though?

Professor Clarkson: No, that is right. We would not have our squadrons, whether nuclearly armed or not, at the service of Colorado.

Mr. Lewis: Of only the United States as aimed against the Soviet Union, because your whole proposition is that it should be an understanding with both powers south and north, as it were, of us.

Professor Clarkson: That is right.

Mr. Lewis: Then that surely means that the present NORAD is not of any purpose. Why is it not possible to say that it does that?

Professor Clarkson: It is quite conceivable that we should end that particular agreement and establish our relations on a different kind of organizational basis. It

● 1205

is clear that we still need some communication with the American defense department and planning operations because we have our own armed forces in North America. What I am interested in is the effect of our policy—and the organizational form that it takes could be worked out—but I do not think there is much area of disagreement there.

Mr. Lewis: No, there is not. You are not quite as prepared as I am to say that we should get the hell out of NORAD.

Professor Clarkson: You see, I am also concerned about the effect our action has on the Americans, and in such highly emotional problems as the organization of NATO and NORAD I think Canadian actions can very easily be misinterpreted, and one does not want to generate the feeling in Washington that the Canadians are stabbing them in the back. This really raises the point of how we pursue our foreign policy in the

United States and I think we should conceive of it in a much more educational or, in a sense, public relations fashion so that we will make it clear to the Americans what our policy is and why, so that they will not just read in the *Washington Post* that Canada is getting out of NORAD. It is a question of Canada redefining its role. This is explained and made clear in books that are published in the United States. As you know, Canadian books are generally not published in the United States because of the American tariff laws. However, I would envisage a major increase in the efforts of the Canadian government to explain Canadian policy in the United States so that we are not just the Eskimos of the North. We are a power which has an independent mind and we have certain policies we want to pursue that we also conceive to be in the American interest. Again my answer is given partially in hesitation because I am concerned about the way an act is interpreted, because the way it is interpreted affects the ultimate success of the policy.

Mr. Lewis: Thank you.

Vice-Chairman: Mr. Nesbitt.

Mr. Nesbitt: Professor Clarkson, I have three questions I would like to ask. First of all, I think you will probably agree that the question of NATO must be interrelated with all other aspects of world foreign policy with which we are concerned. Quite a few Canadians, have expressed a view on this, but Mr. Escott Reid is perhaps the original promoter of the idea that the two major problems we will have in the world for the next 25 years—or 50 years perhaps—are assistance to the growth of newly developing countries, an aspect which you of course deal with, and the normalization of relations between China and the Western world.

First with regard to the role that Canada might take in respect to assisting newly developing countries, I do not think there would perhaps be many people in Canada who would disagree with that general principle. So you suggest that as we do this at an increasing rate we should tend to generalize our assistance, perhaps through the United Nations or some other body, or do you think we should do it perhaps in a more bilateral way in certain specific areas, such as Latin America or the West Indies, or something of that nature?

Professor Clarkson: I think basically our aid would remain bilateral. I am not convinced by the argument that bilateral aid is bad. To the extent that the United Nations were capable of channelling more productively Canadian aid, that would be fine and we should certainly work with the United Nations agencies or other international agencies, but that is a technicality that is worked out when there are different kinds of projects. Perhaps technical or

educational aid might go better through certain international agencies when cultural questions are involved, but I think politically one also has to think of aid as an essentially bilateral relationship because for purely economic reasons Canada could only afford a very massive aid policy if it led to Canadian industry being used in the aid. I think the base of my economic proposal is one of shifting a certain amount of economic activity from defence economic operations to an aid industry and I do not think that one could interpret balance of payments and other factors and operate a very vast aid program without thinking of it basically as a bilateral program. There

● 1210

are all sorts of other reasons, such as it would provide activity for young people who want to work in the developing countries. We would be able to develop a certain Canadian expertise in areas such as road construction, if that was a major need in Africa, or in certain activities that we knew were in need and could spend the money on. They could be developed as a Canadian operation and a specialised Canadian aid industry.

Mr. Nesbitt: Yes. Presuming that we should do it on a bilateral basis, do you feel that we should tend to concentrate such assistance in certain areas of the world or should we do it in a more general way?

Professor Clarkson: I think the argument on that is in favour of specialization. Obviously there are a number of factors involved. Should you help the poorest countries or the better off? Should you help those with the least potential of the most economic potential?

Mr. Nesbitt: You think it should be done on what our abilities to grant aid are, perhaps?

Professor Clarkson: There are a number of factors. Roughly, I would say that at the moment Africa is the most productive area of aid operations. There are several reasons for this: one, because of the predominance of French-speaking countries in Africa; two, because of the colossal need; three, because the potential for growth is very great simply because the level of economic development is so low; four, we have already developed a special relationship with certain African countries such as Tanzania in a most productive way and there is no language problem, it is either English or French, and there are a number of very good reasons why Africa is very suitable.

I think the Caribbean is also another area, and there is personal contact with the Caribbean world. However, I would put Asia ahead of Latin America for similar kinds of reasons, that the kind of development that takes place in Asia is more hopeful, the needs are very great, whereas in Latin America it

is difficult to make these judgments because we are very rich and they are relatively all very poor, but the development is quite different in Latin America. In my view it is not very helpful to give a great deal of aid to a country that has a political system that will frustrate the development prospects of the country.

Mr. Nesbitt: To get to the second matter and to deal more specifically with NATO and that related body, NORAD, the brief that you presented—a very well arranged brief, if I may say so—as I read it is predicated perhaps on the assumption that a steady decrease now and into the reasonably foreseeable future is intentioned between the United States and the Soviet Union. While this would perhaps appear to be likely at the moment, I think one would agree that it is sometimes a little difficult to foresee the policies that may be pursued by future authoritarian governments in other countries. People in other countries are sometimes motivated slightly differently than ourselves. Do you not feel that it might be rather a risk to put all our eggs in the one basket, so to speak, based on the assumption that relations between the Soviet Union and the United States will steadily improve.

Professor Clarkson: I am not assuming steady improvement; I am assuming a kind of balance. In a sense the relations have improved enormously if you look over the past 15 years since the death of Stalin. I do not really foresee any major change in the U.S. - Soviet relationship. The ideological differences are clear and they are decreasing in impact, really.

Mr. Nesbitt: Excuse me, Mr. Clarkson. I grant you that, but in view of the fact that other governments—and the Soviet Union—have authoritarian governments and often the personnel changes rather suddenly, do you not think there is some considerable risk in planning our foreign policy, and related defence policies, on the assumption that there will be no change, let us say, in Soviet policy?

Professor Clarkson: I am not assuming there will be no change in the Soviet system. I think we have to recognize that there has already been a change for the worse since Khrushchev was deposed. There has been a re-Stalinization of the regime in Moscow. It

● 1215

has been clear from the trials of the writers and the Czechoslovakian invasion has made that clear in East Europe. I would say that the generation of political leaders who are going to take over in the next 10 years are just as conservative, just as authoritarian as the current Brezhnev-Kosygin team. They are the people who come out through the Komsomol and the trade union movement and we cannot expect

them to be more liberal than the current leaders, so I do not see any reason why they would be more aggressive internationally.

Mr. Nesbitt: I have another question. At the present time we perhaps generally accept the fact that the Soviet Union may be paying a little less attention to her interests, or what she believes to be her interests, in Western Europe and perhaps even North America because of her current problems with China. Do you foresee any possibility of the leaders or future leaders in Peking and Moscow getting together and having a rapprochement?

Professor Clarkson: If you mean is there any immediate prospect, no.

Mr. Nesbitt: No, I would agree but, say, within the next ten years perhaps.

Professor Clarkson: The possibility is certainly there but I think it is very unlikely because of the tensions that exist: we have all read of the border incidents currently taking place. You see, the future trend of the Chinese regime does not seem to be towards liberalization.

Mr. Nesbitt: Let us put it this way. In the unhappy event, from perhaps our point of view or others, that there should be a rapprochement between Moscow and Peking within the next ten years, do you think that might increase the potential threat to the United States?

Professor Clarkson: I think it would decrease it in this sense. Let us assume that the world military policy is basically a conservative one of maintaining the status quo. Now they are very aware, as we know, of the danger of nuclear annihilation, they are obviously engaged in the arms race, so they step up when the Americans step up and vice versa. But I would think that a rapprochement, in other words, between Peking and Moscow would basically have to be on Moscow's world military policy terms. That, after all, was one of the reasons for the split. The Chinese felt that the Soviets were getting into an alliance with American imperialism. I find it hard to think of a rapprochement being the other way around, the Soviets joining up with some kind of wild Chinese foreign policy.

Mr. Nesbitt: I have two other questions. In the event that (a) Soviet policy alone towards the West becomes more aggressive or (b) that there be a rapprochement between the Soviet Union and the Peoples Republic of China within the next ten years, that in either of these events the United States authorities might feel from their point of view that the potential threat to them had increased, if in the

meanwhile we had largely withdrawn, from a military point of view, from NATO and NORAD, do you think that the United States would permit a neutralist vacuum in this area to the north, if it felt that their own security was endangered? In other words, do you think if the United States felt there was a serious threat to its own national security they would permit a large military vacuum like Canada to exist immediately to the north and on her borders, with whose economy, even for peaceful means, she is fairly closely integrated?

Professor Clarkson: This would very much depend on how the denuclearization of Canada was arranged. It is obviously conceivable that if the fundamental world balance of military forces were overthrown and changed significantly this would involve a major change in American defence thinking. It would also involve a major change in Canadian defence thinking. In what I would say is the extremely unlikely hypothesis that you are presenting, we ourselves would undoubtedly re-assess and we might no longer feel that the Soviets, in your hypothesis, had lived up to their part of the agreement by which we had established the denuclearization of Canada. So I would think that we ourselves would be re-assessing. Directly on your question whether the Americans would permit it, they would in any case in what I am proposing have their own defence organization geared around the Soviet threat. I do not see it. You are hypothesizing a major shift of the world balance of forces which would impel Canada to re-assess its military situation, but I do not see really, even so, that it would make much difference. Once things get that bad a small power like Canada is not going to make much difference.

Mr. Nesbitt: Sometimes in international affairs life is full of surprises and they are not always pleasant ones.

• 1220

In the event of our reducing our military role both in NATO, even if without getting out of it entirely, and in NORAD, would you foresee that perhaps the United States might request, and perhaps very strongly request, the use of certain military and naval bases in Canada for her own protection?

Professor Clarkson: Not if it is done right, no. The whole point of doing this would be to arrange a reduction of armed forces in the northern part of North America in such a way that the United States and the Soviet Union would both be satisfied that there had been a significant decrease in the threat coming from the north. Now you are obviously, raising technological-military problems in your question because it seems less and less important for the American defence machine to have air or naval bases in Canada.

Mr. Nesbitt: Well that is a matter of dealing with the types of hardware involved, which is a technical matter.

Professor Clarkson: Well what I am proposing is not a unilateral "we are getting out" type of thing but a negotiated reduction of superpower tension by Canada playing a creative role in that area that Canada affects, namely the north-south route.

Mr. Nesbitt: Oh yes, I quite understand the thesis. I am just asking if the United States felt—and I think this is not an unlikely assumption—that Canada was not contributing to the kitty, so to speak, for NORAD, or contributing at least in decreasing amounts, would she likely feel, from her own point of view, that she herself had to take over the defence of North America?

Professor Clarkson: Well then we would have failed in what we are trying to do.

Mr. Nesbitt: And this might well entail the use of certain bases in Canada. Do you think then that the posture Canada would put to the rest of the world would be that of a genuine neutral such as Sweden or Switzerland, or do you think we might be regarded as somewhat of a military province of the United States?

Professor Clarkson: Well I myself cannot foresee the Americans imposing military bases on Canada in time of peace when we ourselves are wanting to renegotiate the defence arrangements. That just does not sound credible, unless you have some kind of military takeover in the United States.

Mr. Nesbitt: Peace is a rather relative term in the modern world, is it not? I have just one final question. I think everybody's questions are a bit long this morning.

The Vice-Chairman: Perhaps shorter questions would attract shorter answers. I think this would be the feeling about now, particularly as we are starting to get a little cramped for time. We have five more questioners: Messrs. Allmand, Nowlan, Prud'homme, Gibson and Cafik in that order.

Mr. Nesbitt: Perhaps I might put one more brief question. Do you feel that in the event of a major war between the United States and either the Soviet Union, China, or both, Canada really could become uninvolved in view of the geography of the situation—Detroit, Montreal, the seaway and things like that?

Professor Clarkson: I think in the major war that you are referring to, Mr. Nesbitt, there would not be much time for us to think about it.

Mr. Nesbitt: Good enough.

The Vice-Chairman: Thank you, Mr. Nesbitt. Before calling Mr. Almand, would the Committee agree to print Professor Clarkson's advance presentation, including the summary and supplementary notes, as an appendix to this day's Minutes of Proceedings and Evidence?

Some Hon. Members: Agreed.

(See appendix attached)

Mr. Allmand: Professor Clarkson, I too want to compliment you on your brief. I find your recommendations the most appealing that we have received so far. Although some of my questions have been asked I want to clarify in my own mind some of the things that you have said.

Are you suggesting that once we decide on what the best role should be for us, and perhaps what the best role should be for NATO as a whole, that we should then go to NATO not with an ultimatum or a dogmatic position but to negotiate what we believe our role to be and what we believe NATO's role to be? Is this a correct interpretation of what you are suggesting?

Professor Clarkson: Yes.

Mr. Allmand: Further to that then I would think that if this negotiation is to be meaningful there would have to be a point beyond which we would not go. In other words, whereas we might be willing to compromise in our position to a certain extent, obviously there would be a maximum and a minimum in the compromise situation. Is this also more or less the way you see it?

Professor Clarkson: What kind of maximum-minimum?

Mr. Allmand: You know, you have made certain suggestions in your brief and I am fairly sympathetic to them. You are also suggesting that we go to NATO and say, "Here is what we think Canada's role should be; here is what we think NATO's role should be; let us negotiate; let us consult on this." We may find stiff opposition within NATO to our suggestions. I would think that if we are really

● 1225

serious about the negotiation we would be willing to give a little. However, I certainly think that we would have to decide before we go into such negotiations what the area of compromise must be, too, and perhaps draw ultimatums to a certain extent and say, "If you insist on this we do not stay in."

Professor Clarkson: Well, to the extent that we are wanting to reduce our expenditures on armed forces, you know, in a significant way over a ten-year

period and someone said look you should increase them, that kind of thing we would not be talking about very, very seriously. The word "ultimatum" is a very strong word in terms of international negotiations and I would not think that we would be successful in our objective of encouraging the European powers especially to rethink their defence arrangements if we call for a re-appraisal, on the one hand, giving the impression that things should be rethought and at the same time saying we think very precisely on the following five problems and they are not negotiable. It would be a question of working out the details and that is why I am reluctant to say the NATO organization should be disbanded or should be continued. These things will be worked out. The important thing would be the amount of resources we allocated to certain areas—military and aid, our wanting to encourage a European settlement—certain basic objectives that do not have to be put in terms of ultimatums, because we are not giving the Soviet Union an ultimatum that they have to negotiate on West Germany, on Berlin and on the eastern border of Germany. These are the objectives that we want to see achieved in, say, the ten-year period. We consider it unacceptable for the European situation to continue indefinitely with this fundamental source of tension and instability, but that is not the kind of thing you put an ultimatum on.

Mr. Allmand: Maybe I used the wrong word. I meant "dogmatic".

Professor Clarkson: To answer your question, I think we would want to make it clear what our view of the situation roughly is, and that is why we are calling for a re-appraisal—because we think that by their behaviour France certainly, England certainly, have in the past few years re-assessed their situation, and this should be brought together and reformulated.

Mr. Allmand: I understand also from your analysis that you do not feel that there has been sufficient co-ordination or rationalization within NATO of the role that might be played by the member states and that more could be done to make these roles more complementary. For example, you suggested that Canada could play a more experimental role within the Western alliance. As I see it, if we had the proper consultation with our NATO allies we could probably rationalize to a much greater extent than is now being done. The total use of the NATO countries with respect to foreign policy goals for NATO as a whole was directed towards détente and peace in Europe. Is that not correct? Do you feel there is enough rationalization now and co-ordination of the various NATO states within NATO?

Professor Clarkson: Well you are talking on two different levels now: rationalization, militarily, and

● 1230

co-operation, politically.

Mr. Allmand: Yes, but I see one tied to the other.

Professor Clarkson: Well at the moment they are not. That is one of the problems.

Mr. Allmand: Yes, that is it.

Professor Clarkson: France has its own communist policies on its bilateral approach to Soviet relations, with Czech relations, Polish relations and it is carrying on quite an independent communist policy. Even, in a sense, probably its military policy is more integrated because the troops are there and they are potentially in the NATO organization, or would be there in case of a conflict. But my response would be roughly the same as my response to Mr. Brewin, that one should think of the military problems in Europe and one should think of the political ones. In terms of a ten-year prospective our concern should be with the political development of Europe, and the military really should start to look after itself if one gets discussion and negotiation going on the political problem. We have a great obsession with the military—primarily, I think, because we do not face the fundamental political problems. I remember Escott Reid said at a C.I.I.A. conference a couple of years ago that when he was the ambassador in Bonn from about 1959 to 1961 or 1962 there was no fundamental discussion of the German situation among the allied powers. I found that very shocking. There was a crisis over Berlin and there were problems in Germany. There was no attempt to raise the German question in terms of achieving a basic settlement, and that is the kind of thing I do not think we should allow to continue. I am not saying that just by raising the question we are going to get a solution, but I would think, considering the next 10 years, that it is not unreasonable. After all, East Germany has been stabilized by the Berlin wall; it now has an economic viability that it did not previously have. According to Western observers, there is political support for the regime. One of these particular observers is Professor Jean Smith of the University of Toronto. This gives East Germany a greater stability vis-à-vis West Germany, and there is a potential for negotiation that is not simply the one strong West German power against the tottering East German. There is now a basis for negotiation and discussion, and what is partially needed is for questions to be asked, and if this is the Trudeau style I think it should be applied internationally.

Mr. Allmand: Thank you.

The Vice-Chairman: Mr. Nowlan.

Mr. Nowlan: Mr. Chairman, I have fewer questions now than I had before in view of the other questions. I would first like to ask Professor Clarkson some questions that Mr. Lewis touched on. He mentioned

a couple of my points, although he perhaps worked from a different angle. He mentioned the Harmel plan. I think your paper was most stimulating and even in the presentation of your thesis, but I am surprised you are asking for another review in view of the Harmel plan which was done shortly ago and, as I understand it, at our initiative. I wonder if you could briefly reconcile the review of the Harmel plan of less than a year and a half ago with your thought of Canada again requesting another review of NATO?

Professor Clarkson: Mr. Nowlan, the reappraisal would be in terms of the declaration of intent by Canada to shift its foreign policy resource allocations over the next 10 year period, and I would therefore think that declaration assumes a revised view towards NATO, so it makes a different kind of reassessment necessary.

Mr. Nowlan: In effect, the new factors that you indicated earlier today, and also mentioned in your paper, of a new government as well as Canada's declaration would thereby stimulate a review.

Professor Clarkson: Plus the change of regime in Washington. There is one factor that is quite different from a couple of years ago; that is the American intent to withdraw from Viet Nam.

Mr. Nowlan: Yes.

Professor Clarkson: This may take another couple of years. It is obviously not an easy question. You have generally a withdrawal of active military American commitment in Asia. You have probably a similar kind of withdrawal of American overextension of military commitment around the world, and I would think it would be very much in the United States' interests if they could see fit to have a renegotiation of the

● 1235

European situation.

Mr. Nowlan: I will not pursue that at the moment. I will not pursue that, period, because I will not have another moment. I now come to the other thing that disturbs me, although many of your objectives—as Mr. Allmand said—most constructive and challenging. Perhaps in some ways I am like Mr. Lewis. I am not suggesting academic shuffling but perhaps theoretical, and I wonder how practical this would be. For instance, with respect to Germany you suggest that the emphasis should be on the economic, political and then military, and as soon as you raise the question of Germany—which you set out in your paper as perhaps being the thorn in the flesh of some of these problems—you get the other side of the coin, do you not, in the sense that in theory the West Europeans should look after own defence, but has it not been because of the very fact there is a NATO that countries other than West Europeans have sort of

diluted the German threat as far as the East Europeans—and especially Russia—are concerned?

Professor Clarkson: No. My analysis would be the opposite. Unfortunately NATO has increased the East European perception of threat from Germany because it has led to the rearmament of West Germany. I disagree on your last point.

Mr. Nowlan: Do not hesitate to disagree. I am just trying to rationalize the conflict in my mind. You mention the ideal of West Germans defending West Germans, and I agree with that . . .

Professor Clarkson: Why do you say that?

Mr. Nowlan: I thought you said earlier that the West Europeans were balanced off against the East Europeans. You mentioned the German problem and our withdrawal, and when you speak about our withdrawal as a North American country I presume you are also talking about the American withdrawal from NATO, are you not?

Professor Clarkson: Oh, no. One would have to consider what the Americans would do.

Mr. Nowlan: Certainly on your thesis that the West Europeans balanced against the East Europeans would thus open up the way for exploration of the German question—Berlin, and some of these other issues—then surely if we had the power to do that our withdrawal must be followed by an American withdrawal from Europe, or what is your view on that?

Professor Clarkson: My view on that would be that you would be very unlikely to get a complete withdrawal of American troops from Europe until the Berlin and German question had been resolved.

Mr. Nowlan: Then that leaves the . . .

Professor Clarkson: The one obvious reason for this is that the whole Berlin situation is still a four-power situation and, as archaic and anachronistic as it may be, that is very central to the problem and you could not expect the Americans to withdraw before a solution; it would be part of a solution.

Mr. Nowlan: Then does this not sort of aerate some of your thoughts about the admitted insignificant contribution of Canada in terms of manpower, although psychologically there may be a contribution, and that our withdrawal from a NATO situation is not really going to open up this area of West Europeans versus East Europeans until you resolve the American problem. I just do not quite see how you rationalize that.

Professor Clarkson: Could you repeat that? Until we resolve the American problem, or do you mean the German problem?

Mr. Nowlan: You say our withdrawing will tend to shift the emphasis to West Europeans versus East Europeans. I suggest you are forgetting about the United States because by our withdrawal you are not really going to be able to open up Berlin, as you already mentioned, or the reunification of Germany, and others before you have suggested that the German problem is really going to be at the last stage; you will have the United States and Russia, the West Europeans and the East Europeans and then finally down at the bottom, or in the concentric circles, the Berlin problem or the German problem.

Professor Clarkson: No, I am not forgetting the United States. It is really central to my analysis that by acting ourselves we would provide initiative to get the Americans negotiating: in other words, starting the process of change going, and that we are not insignificant. I did not say that our main role is insignificant.

Mr. Nowlan: No, you did not.

Professor Clarkson: You might have interpreted it in terms of unimportance, but the importance of our

● 1240

relatively small role in NATO, although still being part of the NATO Alliance, is such that if we declare we want to reorient our total foreign policy, and specifically towards Europe, in doing certain things, this combined with a call for a reassessment of NATO and also I think the specific objective of resolving the German question as the central question in East and West European tension would be part of a package and we would continue our efforts to ensure that it did continue a process of renegotiation between East and West Europe. So, the role of the United States is obviously fundamental and the role of Canada in this is as a kind of catalyst.

Mr. Nowlan: I see. You do not think that we could play a catalyst role even within the alliance on some of the very necessary problems that have to be resolved.

Professor Clarkson: But this would be within the alliance in the sense that we are starting off now.

Mr. Nowlan: But to use, for what it is worth, the fact of our withdrawal and pull-out as one of the bargaining points, if it was a factor, rather than throwing the poker hand on the table before this and saying that we are getting out and we hope you do this, that and the other thing. I am wondering if

we do not have the cart before the horse and why we are precluded from stimulating discussion in our present situation.

Professor Clarkson: We have not done it very successfully . . .

Mr. Nowlan: No, I appreciate . . .

Professor Clarkson: . . . and I do not accept the poker analogy. It is not a question of the Soviets not knowing what our cards are. They know the debate is going on. The Canadian people will know pretty soon what the result of the foreign policy review is, and . . .

Mr. Nowlan: No, the poker analogy . . .

Professor Clarkson: . . . I think we should think in terms of mutual reduction of forces, but whether we have to keep our Canadian troops there until the Soviets in some way withdraw one or two divisions from Poland I think is beyond our control. I think one should assume more realistically that if we reduce our commitment to Europe in terms of troops actively involved on that soil, that over time there would be a certain pressure on the Soviets and the East Europeans to reduce their arms.

Mr. Nowlan: I would like to explore that further but time is running on. I would like to ask one more question on a matter which has not been opened up here, and it may not be, although you certainly raised it in your brief as well as referring to it this morning. I am referring to the national flavour of our external affairs policy obviously reflecting the component parts of the country. This leads me to the question of a nation in foreign affairs. You certainly have Quebec, which is also interested in external relations, and I wonder how you reconcile the two, or are you going to curtail one in order to have the national flavour develop to the full?

Professor Clarkson: I do not see any . . .

Mr. Nowlan: Or do you see any conflict?

Professor Clarkson: . . . fundamental difficulty, given goodwill on both sides, both the Ottawa and the Quebec sides. It seems to me that the creative and constructive contribution that the Government of Quebec can make to Canadian foreign policy is untapped and that specifically in relations with France or specifically in relations with francophone countries it obviously would be French Canadians who would be applying our aid to the francophone countries.

Mr. Nowlan: No, but as the Government of Quebec or as part of the Government of Canada?

Professor Clarkson: Both. Ontario has a foreign policy in the sense that we send trade missions to Europe. That is part of Canadian international economic policy. These again are details.

Mr. Nowlan: I see. My last question—and someone else may be going to touch on it—is about the peacekeeping force in Canada. We keep talking about reduction of forces but you still intend . . .

The Vice-Chairman: You have tacked a supplementary on your prior question. Would you hold it for a minute, Mr. Nowlan. Mr. Marceau on a supplementary.

[Interpretation]

Mr. Marceau: Mr. Chairman, I would like to give more details about what my honourable friend just said. I do not believe that Quebec has expressed the intention of having an external policy. I believe one

● 1245

forgets the distinction made by Quebec. What Quebec wants is an extension of its various exclusive jurisdictions. In the field of education for example, what Quebec wants, is that its jurisdiction be extended outside Canada, without however entering into conflict with the external policy of Canada, as the latter is accepted by Quebec as pertaining to federal jurisdiction. To be fair, one should say there is a problem. But one must admit that Quebec seems to be prepared to compromise and that the attitude ascribed to Quebec does not enter into conflict with Canadian external policy to the point that one was led to believe. There is a problem, but I think that with negotiations, we could reach an agreement. This is my opinion.

Professor Clarkson: Could I consider that statement as a question and answer it?

Mr. Marceau: Yes.

[English]

Mr. Nowlan: I may agree with part of what my colleague said but I really do not think that was a question. It was an explanation of my question. I am not going to disagree with it or agree with it in part, because I believe there are perhaps several areas of potential conflict here and I do not want to pursue the point. I was just going to ask something that is separate and apart from this. Professor Clarkson really answered my problem there. My question has to do with this peacekeeping force. I gather from your thesis that you assume regardless of what we do we are still going to have to have some type of peacekeeping force in Canada with transport capability and mobility. Is that correct?

Professor Clarkson: Right.

Mr. Nowlan: You do not want to get down to the technical terms as to how big a component that is. You have related it to gross national product but are you thinking in terms of 100,000 or 50,000, or just a nominal force of 10,000?

Professor Clarkson: In terms of numbers of troops?

Mr. Nowlan: Yes, to see how you can relate the gross national product to the peacekeeping force you are talking about.

Professor Clarkson: I think this Committee should exploit the expertise of its witnesses, and I do not claim to be a military expert. You obviously get what you pay for, and it would be a smaller specialized force. You would have economies of specialization. You would probably get what you wanted for less expense, in my view.

Mr. Nowlan: I will pass because of the time.

The Vice-Chairman: Mr. Prud'homme?

[*Interpretation*]

Mr. Prud'homme: Professor, I agree entirely with you when you say the question is not a simple one and that it cannot be settled by yes or no.

However, the question I would like to ask was asked by some of my colleagues, in a slightly different way though. According to you, what would be the reaction of our allies if Canada informed them of its intention to play a new role as a participating member of NATO while operating in close cooperation with its allies. Would this not be opening up a new avenue to our allies rather than telling them: we are leaving the Alliance.

My opinion on this subject is—and I would like to have your comments—that it would be difficult to say that from the 10th of April: Out we go. I believe this possibility does not fit within present realities. However, as I said earlier, maybe we could voice our intention to play a new role which could be a combination of what you have suggested in your brief and of many other suggestions voiced here quite clearly by other witnesses.

Do you believe that Canada could immediately inform its allies that in the future it wishes to play a different role but that it wishes to do this in close cooperation with them? Do you believe that at the present time NATO members are prepared to receive such manifestation of intention from Canada?

Professor Clarkson: Mr. Prud'homme, you are asking two questions in fact. The second one being

whether our allies are ready to accept such a re-evaluation of our role. I believe that they do. We already know that France has re-evaluated its political and military role within NATO. We know that the English believe that the communist threat is much less important than it used to be and that they are in fact reducing their military expenditures. We know that the Belgians, for instance, do not have a very large military commitment.

● 1250

As you can see, it is not simply Canada which wants to change its external policy. I believe that the Germans, like Mr. Nowlan said, are facing serious problems and that the German government would be the least prepared to accept without protest such a reorientation of our external policy. This is the problem, and I think that we have to face it. Thus the problem is the reaction of the Germans. We must take it into account with patience and consideration, but that is indeed the problem. That takes care of your second question.

Now, let us deal with your first question. It would seem to me that it is possible, to a certain extent, to stay within NATO while changing our policy. However, if it is really important for us to change the orientation of our external policy, I think it would then become important to change the name of the Alliance, for symbolic reasons, if not for other reasons. NATO has an image.

Mr. Prud'homme: A military image.

Professor Clarkson: We, Canadians, are members of NATO. This sometimes hinders our freedom to give assistance to a non-allied country. I think that if an important change is made in the role of Canada and Europe and if the character of the Atlantic Alliance of the Western Countries changes, it would be normal for the organization to change also. To get back to Mr. Lewis' questions, this, essentially, is my proposition. There would be changes but, in so far as I am concerned, what is important is not whether or not to have NATO as a name, but what role Canada will play and how we are going to play it. Does this answer your question?

Mr. Prud'homme: Yes.

Professor Clarkson: One cannot stay within an organization and change one's role completely without influencing the organization itself.

[*English*]

Mr. Prud'homme: To return your courtesy, I will ask my next question in English. One of my concerns is this question that you have raised yourself. How will this be received in Germany? To

me, it is Germany that is the nerve centre of the NATO alliance at the moment.

I suppose we will hear a great deal about that in Europe, and if we could find a new way acceptable to the German people I suppose that would be helpful. I do not like to call it Canada withdrawing from NATO, because that always sounds negative. I would rather call it a new role for Canada in NATO; that is more positive.

Professor Clarkson: I would rather call it a new role for Canada in Europe, because if you centre everything on NATO you are assuming that it should continue forever, which obviously we do not want to assume. No organization is eternal. We should have a European policy and whether that should always include NATO...

Mr. Prud'homme: May I interrupt, sir? When you say, "which we do not want to assume", who is the we? Do you mean Canadians?

Professor Clarkson: I do not think anyone would want to assume that the NATO organization would be a permanent feature of Europe, either the West Germans themselves who officially want a unification of their country, or the Americans who want to achieve a stabilization of Europe. It is a stop-gap organization that was set up in 1949 with specific defensive aims, intended explicitly to run for a certain length of time. It was part of the treaty that the countries could renounce it under article 15 and leave within a year. It was set up with a certain time horizon in its founding statutes.

Mr. Prud'homme: I do not know if my next question, which is my last, would be well received higher up somewhere in Parliament, but do you not think that at the moment Canada should start thinking positively of a kind of new rapprochement with the Government of France under President de Gaulle?

Professor Clarkson: What was your question? Do I think that Canada should now...

● 1255

Mr. Prud'homme: Start making positive gestures of rapprochement with de Gaulle in order to be able to play a new role in NATO. For instance, if we could establish close contact with the Government of France, perhaps this could be a second step. President de Gaulle was the first to leave NATO, and now Canada wants to play a new role in NATO. Without being influenced by France, perhaps we could form a new Canada-France alliance, in a new role in NATO.

Professor Clarkson: I think those are two rather different problems, and very difficult to link. I

would be in favour of Canada improving its relations with France, but I would not think that the best way to go about it is to suggest that our common purpose would be a reorganization of NATO, in the sense of bringing France back in when it is so clearly de Gaulist policy...

Mr. Prud'homme: Could we not profit from their experience?

Professor Clarkson: Now your implications are different. If new France-Canada relationship were based on trying to reassess NATO...

Mr. Prud'homme: We could profit from France's experience.

[Interpretation]

We could use France's experience in our development of a new policy within NATO.

Professor Clarkson: I agree, but I believe that in order to use it, we would have to study the consequences of the French attitude.

Mr. Prud'homme: That's right.

Professor Clarkson: I would say that the French action was a manifestation, within an Alliance, of a fairly strong independence, to try and influence American policy. I think that the results of these 10 years of Gaullist policy show that this is a failure and that the Americans have pursued their foreign policy without taking French policy into account. So, Canada should draw the conclusion from this that, yes indeed, it should try and influence American policy but not as though it were the policy of some kind of enemy within an alliance, but, on the contrary, as that of a friend who is of the same opinion. NATO must be re-evaluated, but in a manner that is more likely to be understood by the United States.

[English]

Mr. Prud'homme: That is exactly what I meant. I am glad you came to the same conclusion about profiting from their experience of leaving NATO. I do not think it was a good experience. Like you I would call it a very bad experience. But by profiting from that experience, maybe Canada, a small country, could arrive at a positive reassessment of its role in NATO.

[Interpretation]

By using France's mistakes. I fully agree with you; to turn up on April 10, for instance, and say: "Now, out we go," is no way to deal with one's allies. I do

not believe that this is not an acceptable way of proceeding on the international level.

Professor Clarkson: There is another aspect of the French experiment which one tends to ignore when discussing NATO namely, that France is not that keen on NATO. And if you want to reevaluate the role of NATO in Europe, it must be borne in mind that NATO is actually an alliance without France. It is all good and well to say that France is there, that its armed forces are always there in case of aggression, but in fact, France has an independent military force that is not integrated in NATO. It is a member of the Alliance, but not in its most important aspect.

Mr. Prud'homme: The military aspect.

Professor Clarkson: Yes, the military aspect. So, the reorganization of the military links between Atlantic Alliance countries, especially in Europe, and which would take into account French policy, should be carried out on the level of a far greater national independence for the European countries. This is a factor that plays against the thesis that the effectiveness of NATO can go on for ever and ever. In my opinion, if you consider seriously what France has done, we cannot maintain vast illusions about the cohesion or the military integration of Europe because this no longer exists. This is a factor one tends to ignore or which is not taken seriously.

Mr. Prud'homme: I would like to ask a last question now. Do you believe that if Canada decided to play a new role that is entirely different from the present one, that this change could have an enormous influence on its allies, other than Germany and the United States?

Do you believe that this change would influence Belgium and Holland, for instance, to the point that this could really mean the end of NATO in its present form?

Professor Clarkson: You are asking me if a change in Canadian policy would mean the end of NATO?

Mr. Prud'homme: That's right.

Professor Clarkson: If after this negotiation that would be unavoidable, it were accepted that Canada

● 1300

should play a different military role, it appears probable that countries like Belgium and the United Kingdom would also want to change their role in order to reduce their military expenditures. Hence, the sum total of the military policies of these countries would be different and therefore NATO, whether or not it were to keep the same title, would be different. But this does not mean there would no longer be any defence of Western Europe. We should

not draw conclusions from this that are too pessimistic in so far as the capacity of Western Europe to defend itself is concerned. Yes, there would necessarily be changes.

Mr. Prud'homme: Especially in West Germany?

Professor Clarkson: Yes.

[English]

The Vice-Chairman: Gentlemen, we have two more questioners. It is now after 1 o'clock and it looks as if it will be difficult to continue the meeting this afternoon because there are a number of other meetings. Mr. Legault.

Mr. Legault: Our questions will be very brief and it should not take any longer than five minutes.

The Vice-Chairman: If it is the wish of the Committee to continue, I will call Mr. Gibson.

Mr. Gibson: I will be very brief, Professor Clarkson. I am interested in the development of the set-up in Europe as a result of Mr. Nixon's visit. I would like to ask you, sir, if you do not think it would be foolish for Canada to make a drastic change in foreign policy prior to a big four conference or confrontation which is likely to take place within the next two or three years on the world scene.

Professor Clarkson: Why do you say it is likely to take place?

Mr. Gibson: I think it is extremely probable that the President of the United States and the head of the Russian state will sit down and try to hammer this out. Let us pray they do. Do you think this is an unlikely forecast of what will happen on the world scene within the next two or three years?

Professor Clarkson: Did you say a big four conference or a big power conference?

Mr. Gibson: A big power conference.

Professor Clarkson: And by that you mean the United States meeting with the Soviet Union.

Mr. Gibson: Yes, at least that.

Professor Clarkson: And that this is going to take place within the next two or three years?

Mr. Gibson: Yes. Do you think this is a probable forecast?

Professor Clarkson: The Americans and the Soviets are going to be talking to each other sooner than—you know, within . . .

Mr. Gibson: Yes, but do you think there will be a real large-scale show down?

Professor Clarkson: You mean a summit conference?

Mr. Gibson: Yes.

Professor Clarkson: Or simply a conversation?

Mr. Gibson: No, a real summit conference.

Professor Clarkson: Well, that is different. A summit means . . .

Mr. Gibson: Perhaps it is different, but . . .

The Vice-Chairman: There is a disarmament proposal conference now.

Mr. Gibson: Yes. We have the Paris talks going on on nuclear disarmament and we have a bad situation in Europe and I am putting this to you. Do you not consider it very likely that President Nixon and the heads of the Soviet Union will have a conference of some sort at a very high level within the next two or three years?

Professor Clarkson: Yes.

Mr. Gibson: Well, then, would it not be foolish for Canada to go off on a different tack, a drastically different tack, prior to that event taking place?

● 1305

Professor Clarkson: Why?

Mr. Gibson: Because if the whole climate is improved—and let us pray that it will be—by a high-power conference, we would be in a better position to look at it then more realistically.

Professor Clarkson: Well, I myself would not hold my breath until the Soviets and the Americans by themselves solved the European problem.

Mr. Gibson: No, but we are looking to 1980.

Professor Clarkson: Yes, I am thinking in terms of that time . . .

Mr. Gibson: I know you are.

Professor Clarkson: . . .and that is why I think one has to envisage what we want to do. We are already starting to take a creative part in getting talks going. Now surely these talks will take place at the Soviet-American level. They should also, though, be taking place within Western Europe. It is not

simply a question of having to wait for one kind of negotiation to take place before any other negotiation can. Negotiations are taking place daily in diplomatic communication among all the countries. What one has to do is to get the processes of fundamental rethinking going as much as we are capable. There is a slight implication in your question, perhaps, that it is presumptuous for Canada, as a smallish power, to get involved in a bigger ball game between the two super powers.

Mr. Gibson: That was not the purpose of my question. No, I do not personally believe in unilateral pulling out.

Professor Clarkson: I want to make it clear that I am not recommending that Canada burn all bridges. I am recommending that Canada make it clear that it is wanting to reorient its foreign policies, its international role, and that one object is to get its allies to rethink and to adapt to the current realities of the international situation.

Mr. Gibson: Thank you, sir.

The Vice-Chairman: Mr. Cafik.

Mr. Cafik: Thank you, Mr. Chairman. Professor Clarkson, I want to join others in thanking you today for your presentation. It is very clear and I think it has been the strongest case for the position that you hold that I have heard since I have been here.

You have maintained in your presentation here today that Europe is now sort of economically of age after the Second World War and can look after its own defence. I think that is a fair statement of what you have said. I too think that is true and this has led me in the past to believe that we should not be involved in NATO. A new factor has been presented to me that kind of sways me to think otherwise. Although they can defend themselves in a normal, conventional fashion, they certainly cannot defend themselves in the nuclear sense and it does not look as if they are going to have the nuclear capacity. I do not think the United States wants them to have it and I do not think it is in the interests of peace that Europe have its own capacity. Then, in view of this, how can they really be expected to defend themselves when they do not have the resources to do it? Our presence is a sort of guarantee to the European powers, especially on the part of the United States, that the United States will back them with their nuclear deterrent in the event something breaks out. If all the North American commitment were removed, that of Canada and the United States, they would not feel quite so secure in that regard.

Professor Clarkson: I am saying first of all that Canada should redirect its military policy, and that does mean certainly withdrawing our nuclear strike force and our troops from Europe. That does not say that the Americans withdraw. There are two things; either their conventional forces, necessarily, or their nuclear umbrella. I think on the conventional forces level for the Americans, that would depend largely on the successful resolution of the German question, because the American forces are integrally involved in the Berlin situation. If you could get to the point where the Americans withdrew their conventional forces you would still have, given the assumption of the balance of nuclear terror being basically a Soviet-American one, the American

● 1310

nuclear deterrent providing that umbrella of protection that it does now for west Europe. Whether the nuclear bombers are stationed in Europe or whether there are nuclear armed submarines in the Atlantic or whether there are missiles in the United States, it is a technical question. The basic point is that the American nuclear deterrent would presumably still be providing the ultimate umbrella of defence for west Europe.

Mr. Cafik: But of course the question in the minds of Europeans under those circumstances would be: would the United States, in fact, guarantee their security when they were not directly and personally involved in Europe themselves?

Professor Clarkson: That is a very real question and that is what de Gaulle has been asking.

Mr. Cafik: That is correct. And do you think it might not lead the Russians then to begin to suspect whether they would really use it? In other words, that they might be encouraged to take a few chances in Europe?

Professor Clarkson: No, I think that conclusion is not justified. Take Western reaction to the Czech invasion in July. There was no question that the West would get involved. NATO had been worrying about the Czech situation since the spring and all

through the summer and there was no hint that because the Soviet tanks were going down the Czech roads the Americans were going to intervene. The risks are just too great and I do not see why the same logic would not be applied by the Russians. The balance of terror is a very real one and the fact that there are American troops in Europe is a significant factor. It is a symbolic guarantee to the Europeans that the Americans will intervene. That is why, as I said to Mr. Nowlan, I do not think you would get a complete withdrawal of American troops until there had been a resolution of the German question.

Mr. Cafik: I would like to pursue this further but I do not think I should in view of the time.

Professor Clarkson: I think one can dissociate the Canadian withdrawal from the American.

What we would be doing by this is rather different from what the Americans would be doing.

Mr. Cafik: Thank you.

The Vice-Chairman: Well, that concludes our questioning. On your behalf, gentlemen, I would like to thank Professor Clarkson for his very well thought out and very well received presentation. Thank you very much, sir.

Professor Clarkson: May I say in conclusion that in a sense I would much rather have your trip abroad take you to countries like Tanzania or Algeria if you want to assess the NATO problem.

Mr. Allmand: Next fall.

Professor Clarkson: If you are going to NATO countries you should also look at NATO as seen from the third world.

The Vice-Chairman: We will consider that another time.

The meeting is adjourned.

APPENDIX TT

CANADA'S ROLE IN LONG-TERM WORLD PERSPECTIVE:
A PROPOSAL FOR A NEW INITIATIVE

Notes prepared for presentation, March 6, 1969 by Stephen Clarkson, Department of Political Economy, University of Toronto.

Preliminary Considerations: What is at Stake in the Foreign Policy Review.

When approached to testify before this important Committee undertaking its historic review of the whys and wherefores of Canadian foreign policy, I was asked to address my remarks to the question of NATO and, more specifically, to give the "anti" arguments on this particular issue. While I do not shy away from taking a clear position—as I hope the latter part of this paper will indicate—I have some misgivings about launching into the fray with fists swinging on the left of this most battered of foreign policy issues.

Frankly I felt it would be doing some injustice to this Committee to provide a pre-packaged argument on what in my view is only a secondary aspect of the foreign policy review. It became very clear on reading the long record of this Committee's hearings in January and February that, regardless of the official subject of my predecessors' remarks, you have already spent two months discussing NATO in all its many dimensions. I wondered whether another re-capitulation of the major arguments at this level of detail would be particularly helpful. Furthermore what struck me in reading the record through is the confusion resulting from the interrogation of the experts. Speakers with roughly similar approaches have differed wildly on particular issues (e.g. European response to a change of Canadian policy) while speakers with quite opposite political approaches have often agreed on particular issues (Canadian security is guaranteed). With some notable exceptions, the analysis has been less centred on the overall international situation on the eve of the 1970's than preoccupied with such short-term considerations as U.S. intentions, our allies' current concerns, or budgetary problems. This preoccupation with the specific as meant that considerations of policy changes has been concentrated on immediate short-term adjustments (troop shifts, possible immediate American or Communist responses) at the expense of the long-term trends in the international situation. The focus on current problems of military organization seems to have precluded consideration of their implications for Canadian foreign planning in the decades ahead.

This concern for the detail of policy at the expense of the rationale for policy was difficult to understand, especially as problems of principle are raised in the terms of reference and in the papers prepared for prior circulation. The reason for this incongruity is to be found, I realized, in the ambivalent position in which this Committee finds itself placed. Having been set up to carry on a thorough review of Canadian foreign policy from first principles, the Committee has now been told to come to a quick conclusion on perhaps the most controversial of all the present policies that are up for review, Canada's role in NATO. Like the Government, this Committee has been placed before a self-defeating ultimatum by the deadline of the April meeting in Washington of the NATO members. The problem is not just that the issue is highly complex with ramifications and implications making clear-cut analysis very difficult. A greater problem is that the immediate "NATO: Yes or No" answer will be decisive in determining the nature of the remaining foreign policy review. Rather than flowing from an overall analysis of Canada's role in the world for the next two decades, considerations of consistency will dictate that Canadian foreign policies be made consistent with the decision on Canada's NATO role. For a decision on NATO will make assumptions, whether implicitly or explicitly, about the nature and future of the international situation, the priorities of Canada's international role, and the definition of Canada's national interests. The limits of discussion on all other policy areas, from aid in the third world to continental economic policy, will be set in broad outline by this single prior NATO decision.

The artificially imposed deadline for an early decision on NATO is requiring you to lock the country into a foreign policy stand for the 1970's without giving you sufficient freedom of mind to consider seriously the long-term considerations from which this foreign policy should be derived.

Importance of Review for Canada.

My alarm that your foreign policy review is being turned upside down is reinforced in my mind by a concern for the immediate impact of the foreign policy review in the Canadian political system. This

is not just a fear that the expectations for change aroused by Mr. Trudeau's announcement of a reappraisal could be disappointed by a reaffirmation of the main lines of the old policy. This Committee is also significant in another political dimension, the effort to make participatory democracy meaningful even in the traditionally secretive area of foreign policy. The activation of this Committee as a forum for consultation with public opinion is an important step forward in bringing in the independent experts and for bringing the parliamentarians (and thus the electors) into the process of formulating foreign policy.

It is especially for this reason that I am worried about the impact of your review on the youth of the country. The Government cannot afford to make a fundamental reappraisal of its foreign policy every year. This review will without doubt lock the country into a foreign policy for the duration of the Trudeau era. This foreign policy will, in other words, define Canada's role for the formative political years of the generation now in its early twenties. I am uneasy that there has been no provision for the articulation of their views. This is all the more disquieting since the decisive decision will be made on that particular policy—NATO—which, for the young generation, is a symbol of the largely irrelevant foreign policy of the past decade.

A final indication of what is at stake is the effect that the redefinition of Canadian foreign policy will have on Canada's nation-building process. Since general dissatisfaction over Government foreign policy has grown—the nuclear strike role, the involvement in Vietnam, Paris-Ottawa relations—foreign policy has not been a source of unity in this country. It has not been realizing its potential as an instrument of promoting national cohesion. As politicians, you are as aware as I of the tremendous symbolic importance that national policy can have for the people. With Canada still grappling with its fundamental political identity crisis, a creative and imaginative foreign policy can be a major constructive force in resolving this tension in the decade ahead. To do this, our foreign policy must be one with which the major elements of our population, English-Canadian, French-Canadian and new-Canadian, can identify.

Having made a case for what is at stake in the foreign policy review which you have undertaken, let me add what seem to me to be two extraordinarily opportune factors facilitating your successful achievement of this goal.

1. Canada has a unique chance not just to dream up in theory but to realize in practice a fundamentally new foreign policy. Consider the following factors:

— a new Prime Minister with a quite different style having announced his intention to make a basic reappraisal of Canadian foreign policy has received a majority mandate both in English and in French Canada. The diplomatic world is thus prepared for Canada to express a revised policy.

— in the capital which is most important to us, Washington, D.C., there is also an unusually flexible situation: the transfer of power in the White House is leading to reviews of such major components of American foreign policy as aid and the anti-ballistic missile system. As long as our foreign policy review can be completed without excessive delay, the revised Canadian international stance can be integrated into the American review as one of the factors in the world situation that Nixon's policy must take into account.

2. for all the disadvantages of having to deal first of all with NATO, the simple fact that the whole NATO agreement is coming to the end of its twenty year mandate makes it possible to reassess NATO in quite a different spirit. It is not a question of unilaterally breaking ranks. The question of its future is not being raised by a dissident member as did de Gaulle several years ago. The organization has lived its twenty years' projected life. The question of the future military co-operation of the current members of NATO is thus a proper subject of debate. This means that Canada need fear no opprobrium for opening the discussion. Quite the contrary, it can offer the Atlantic community the benefit of the considerable energies that have been devoted here to Canada's foreign policy review. What the Prime Minister said of the Canadian constitution is also true of NATO: it is "up for grabs". We will be doing no service to our closest international friends if we do not have the imagination and daring to think ahead for the next ten if not twenty years rather than asking the petty questions about regrouping some troops to Bavaria or redeploying our repainted aircraft carrier.

It is for these reasons that I would beg the Committee's indulgence if, in my paper, I step in where previous—or at least more expert—angels have feared to tread. Rather than becoming entangled in the underbrush of the NATO: Yes/No, In/Out or For/Against debate, I would like to propose an overall analysis both of the international situation and of Canada's role in it. If agreement can be reached on this analysis, you would have a framework for the consideration of the particular foreign policy areas whether military or economic, American or African. For foreign policies ultimately are indivisible. Keeping in mind that the concrete policy issue before the Committee is NATO, I will sketch my analysis of the general principles from which our foreign policy should be derived with special reference to military policy.

The General Framework for a Canadian Foreign Policy in the 1970's.

Two major factors must be considered in defining a total foreign policy: 1) the international situation as it is and appears likely to develop; 2) the country's national interests, both external and internal.

1. The International Situation.

In an age of insecurity, the most important question a country must ask about the world situation is what are the major threats. The answer at any particular moment is crucial since it has already been remarked to this Committee that a major danger in foreign policy making is preparing to deal with the problems of the past. This must always be a problem since leaderships in their forties, fifties or sixties carry into their policy making views of the world determined by their experience gained in their twenties and thirties. The challenge for this foreign policy review, in other words is to try to grasp the problems of man in his world, 1969-1979, not re-live the story of Canada in its world, 1949-1969. A summary sketch of the changing threat in the last decades will illustrate the point:

—late 1930's: Hitler's expansionist Nazism contained by no collective security capacity. Remedial action: none.

—late 1940's: Stalin's military, political consolidation of the Soviet East European sphere of influence threatened politically unstable, economically weak West Europe. Remedial strategy: collective security by NATO plus economic development by Marshall Plan.

—late 1950's: East-West confrontation in Europe with growing tension throughout the developing world, all in the perspective of a nuclear balance of terror. Strategy: East-West status quo defended by U.S. world policing function and some aid effort.

There need be no great difficulty in making a general assessment of the world scene at the close of the 1960's. The stabilization of Soviet and European communism has reduced the former communist military threat to the West turning the Cold War into a less uneasy Cold Peace. One can no longer talk about the "communist bloc" now split fundamentally between the Chinese and the Soviets. Even within Moscow's and Peking's respective spheres of influence, the forces of nationalism, whether in Rumania or Hanoi, no longer make it possible even to talk about the Soviet bloc or Chinese bloc. Where communist regimes have established themselves, they have not shown irresistible practical—as opposed to verbal—external aggressiveness. The China and Cuban revolutions have been less a threat to Western and neighbouring interests than was first thought. The

break up of the communist bloc, its loss of expansionist momentum and the stabilization of the individual communist regimes thus spells the decline of communism as our major world threat. (The Soviet occupation of Czechoslovakia should be seen as a defensive operation by a conservative Kremlin and not a threat of new expansion.) This does not mean the end of either political or military instability in the third world. But it is clear that Western-dominated military alliances like SEATO cannot be relied on to impose stability since the developing countries don't see communism as a major threat but work out their foreign policies in terms of their own national interests, as can be seen from Pakistan's rapid shift from major American base in Asia to principal Chinese ally. As for indigenous revolutionary movements and liberation wars, the prolonged and grizzly record of the Vietnam conflict has rubbed in the lesson that internally generated social and political revolutions cannot be contained or defeated by military interventions of the super-powers.

The major threat overshadowing the whole global situation is the nuclear holocaust. The uneasy balance of terror that was tested in Cuba in 1962 is again threatened by the prospect of the two super nuclear powers entering a new stage of their self-perpetuated arms race, despite the increasingly compatible character of their national interests and the considerable progress it has been made in achieving a working collaboration between them (hot line, anti-proliferation treaty).

What can one project from this apparent situation for the decade ahead? In Europe we can anticipate a general continuation of economic progress with continental integration making progress after de Gaulle loses or leaves power. In the Soviet Union one can hope for little more than a perpetuation of an authoritarian, decreasingly dynamic, but nevertheless militarily advanced system. In the third world efforts to accomplish serious economic and social development will required first of all strong and enlightened national leadership but secondly major supplies of aid from the developed countries. But the growing economic gap will worsen making poverty the world's major menace. We should expect continuing instability, both military (border wars, civil wars) and political coups (army coups, radical political movements). The least predictable factor in our projected scenario is the role of the United States. Whether it will push on with the military technological race; whether it will try to maintain its largely unsuccessful world police role in all areas where it has an economic and ideological interest; whether it draws in its horns, reducing aid and military commitments in order to concentrate on its

own enormous internal social and economic problems: it is impossible to foretell. I would anticipate the U.S. pursuing all three directions. These imponderables must be seriously considered in our policy making. Our policy will have to adapt to whatever the American reality becomes. More important, we must be concerned with helping affect the course of the American debate on these policies that will affect global developments.

The scenario for the 'seventies as I see it is thus one in which the over-riding communist menace that dominated our thinking in the late 'forties and 'fifties is no longer the major concern. Rather the threat to our future is on three levels:

1. *The threat of nuclear holocaust* resulting either from a mishandled super-power confrontation, from their engaging in another stage of their self-generated arms race or from the nuclear capacity proliferating among the middle powers.

The implication for Canadian military forward planning is the highest priority being put on dissuading the super-powers, particularly our American friends, from this hazardous venture and working to achieve disarmament and denuclearization agreements that will keep the nuclear threat within some acceptable limits of instability.

2. *The threat of sporadic local wars* in the third world of the Nigeria-Biafra, Arab-Israel or India-Pakistan types. The military role of the industrialized countries in the third world will not be that of world policemen acting by arbitrary intervention on the model of the unfortunate Dominican Republic episode. Rather it will be one of co-operative peace-keeping and peace-making, small-scale policing operations set up by request of the disputing countries themselves or, where a conflict is beyond such settlement, by international agreement.

The implication for Canadian military policy is that a continued peace-keeping role by a country with an increasingly independent international stance will continue to be in considerable need.

3. To the extent that *the European security situation* can be distinguished from the American-Soviet nuclear stand off, the major source of military tension is less the alliances of NATO and the Warsaw Pact than the political cause of the Tensions these Pacts have grown up to reflect, namely the unresolved split of Germany and Berlin into two ideological opposed sections.

The military implication of this for Canada is that in an economically, politically and militarily restored West Europe, our role can either be to re-inforce the status quo and so help postpone the settlement of

this fundamental source of tension or to press for its resolution. Since the 'fifties and 'sixties have shown that the former strategy and the passage of time have not led to a tackling of the underlying problem, this would suggest that Canada should encourage the re-opening of the dossier of the German settlement.

The military implications of this projection of the current international situation into the 1970's is a declining need for a forward military commitment in Europe but a maintenance of a peace-keeping capability able to act with vigor and effectiveness in several parts of the world—Europe included—as needed and requested on very short notice.

The National Interests: External.

While everyone agrees that foreign policy must serve the national interests, how these interests are defined is as much subject to interpretation as any part of the public policy. To say we want to further the objective of world peace and prosperity is not good enough. Are we going to mean the peace of the status quo that maintains the world imbalance in favour of the rich nations whose prosperity will continue to increase at the expense of the poor? Or do we mean a peace that makes room for the new nations and a prosperity that considers their poverty to be as inadmissible as the slums in our own back streets? In thinking of the long term, our national self-interest must be compatible with the best interests of the world as a whole and we must surely recognize that continued poverty in the revolution of rising expectations is a potent force of internal instability and so military insecurity. If the satisfactory social, economic and political development of other countries becomes a Canadian national interest, then productive relations with all foreign governments in the Soviet as in the third world, takes on a higher priority than regional military alliances. If, as I feel, a major Canadian interest is a weakening of the vicious circle of the nuclear arms race between the two super-powers, it should be a Canadian objective to encourage the consolidation of balancing power centres independent of either Soviet or American control.

The military implication of such an objective would be the containment of the super-powers' defence perimeters, the reduction of the threat perceived by each super-power from the other. This would imply arms control and denuclearized zones.

If the long-term international objectives of Canada are defined by where the needs are greatest, Europe now fully recovered from World War II must cede priority to the third world whose economic development is a moral as well as economic and political necessity. Since we must expect much tension to accompany the pangs of forced development of the ex-colonial people, a maximum international effort

centred on aid would need to be complemented by a significant military capacity of a peace-keeping type.

The National Interests: Internal.

While we must bear the needs of the world community continually in mind, we must also remember that foreign policy is simply one aspect of our Government's total activity. As such it must serve internal as well as external interests. Canada's most pressing national interest is its political survival of a federal state. As the Commission on Bilingualism and Biculturalism is trying to tell us, Canada is undergoing a major identity crisis. Anglo-Saxon Canadians are searching to identify themselves as Canadians in a way that is distinct from the citizens of the United States; immigrants to English-speaking Canada have to adapt themselves to a culture that does not offer them a clear substitute identity; French-Canadians are struggling to determine whether it is not Quebec rather than Canada as a whole that can best give political expression to their collective existence. Since one of the continuing functions of foreign policy is to affirm a nation's personality to the world, it is essential that our own foreign relations be designed to give Canadians a sense of their separate bi-national identity by showing them how they act on and are perceived by the world outside. If it is the highest national priority to build a bi-national, confident and progressive political community, then our foreign policy should be consciously used to reinforce Canadians' sense of identity as a separate country with its own goals and policies. This implies that our foreign policy should bear a clear "made in Canada" label and should not continue its image of being a pale carbon copy of American policy objectives. This is not to advocate in anyway an anti-American approach. Rather the establishment of the distinctively Canadian foreign policy as a complement to the nation-building process implies that Canada should seek ways of being effective in the world arena that are identifiable. This does not mean rejecting all relationships of inter-dependence. It does mean that the worth of alliances and supra-national organizations should be measured in terms of the degree of effectiveness that Canada can have within them.

The military implications of this would be to play down membership in military clubs whose purpose is simply their own self-perpetuation and to play up participation in activities such as disarmament negotiations where Canadian initiative can contribute to the achievement of collective agreements.

If a major national interest that our foreign policy should be achieving is an assertion of the country's bi-national character, relations with French-speaking countries take on a new priority. Aid to French-speaking ex-colonies and efforts to develop a *Franco-*

phonie are two dimensions that can be pursued. It can be argued that, as long as de Gaulle is in power, nothing can be done about Canadian-French relations. This is not certain. Continued Canadian identification with American-led military regional alliances can only reinforce the French image of Canada as American satellite. Other things being equal the implication of a high priority being placed on French relations would be that Canada should strive to reduce its dependence on the United States, both militarily and economically.

There is a third dimension in which a consideration of the internal significance of our foreign policy should affect its design. Isolated external policies, however spectacular in themselves, will have far less an impact on developing the Canadian identity than would a coherent foreign policy that is explicitly integrated with an overall National Policy. Such a National Policy would specify not just Canada's role in the world but the meaning for Canada of biculturalism, regional economic equality and social justice. Our "special" relationship with the U.S.A. would be defined as being able to control our own socio-economic environment was the essential condition for the healthy development of the country.

But the Canadian-American relationship should not solely be defined negatively, as independence from U.S. control. Part of the Canadian National Policy, in my view, should include a conception of how Canada should itself influence American policy making. The question of an anti-ballistic missile system, for instance, should be a legitimate concern among the Canadian people who will be directly affected. The expression of Canadian concerns to the American politicians and American public opinion should be considered a basic national objective. We are the Americans' closest friends; we should act as such: independent, co-operating, frank, and when necessary, critical.

What this means in military-organizational terms could be decided pragmatically. It might mean retaining membership in the NORAD Agreement but shifting our participation from the supply of supplementary forces to participation in policy planning with a view to denuclearizing Canada and having the Pentagon abandon the ABM and MIRV missile systems with Soviet agreement to do the same. The home military role would not need to be very great: enough to patrol the coasts and the Arctic and be ready in time of national disaster.

A Canadian Foreign Policy for 'Seventies.

An examination of the international situation and its projection of how it is likely to evolve, combined with a consideration of Canadian external and internal national interests, establishes the general

framework within which we can shape a long-term conception of how Canada's foreign policy can be developed with a reasonable time span for implementation and realization. The purpose of this section is first to sketch a policy responding to the international situation and expressing Canadian national interests over the next ten year period and second to explore in somewhat greater detail the means of implementing such a foreign policy design.

1. *A Canadian Foreign Policy for 1980.*

Accepting the reality of the declining communist threat, the increasing third world need for economic development resources and the probability of continuing sporadic wars, a reasonable ten year target for Canadian foreign policy would be to reverse the budgetary allocations for military and aid spending. Assuming that foreign and military expenditures stay at a constant 2.5 per cent of the Gross National Product, this means that military and aid allocations would in ten years be switched from 2 per cent and .5 per cent to .5 per cent and 2 per cent, respectively, by 1980. From ranking as fourth or fifth world military power in the late 1940's Canada would have made the transition by 1980 to being a leading world aid power. While maintaining the same per cent of Gross National Product spent for foreign relations, Canada's international role would have shifted from its present one of marginal defence support for the Western anti-communist alliances to a dramatic anti-poverty international development strategy.

Militarily Canada would have perfected a relatively small, highly flexible and extremely mobile peace-keeping force whose range of operation could extend from Europe to Asia, from Africa to Latin America. Its light military equipment would serve both a peace-keeping and a disaster relief role: a strong engineering corps for emergency civil construction, a technological base for mobile communications, and an air transport capability for instant relief operations.

Canada would thus by the end of the 1970's have established a considerable specialization in its international activity, the third world now having number one priority. In its aid operations, Canada would be concentrating on countries and areas where its aid capacities and linguistic abilities gave it the greatest potential for successful impact: French- and English-speaking African countries, the Caribbean, the democratic Asian countries, and those Latin American countries that had proven their ability to make the necessary political and social progress which is a prerequisite for economic development in that continent.

In Europe with which normal international intercourse would be continuing to develop, it would be first economic, then political, and thirdly, military considerations that predominated. By that time, Canada could have worked out a fruitful associate status with the European Economic Community supplying both raw materials and technologically sophisticated products of specialized Canadian industries; in return the European industries would have developed outlets in Canada (on the Volvo model) as jumping off points for their penetration of the North American economy. Politically our contribution would be essentially to encourage the development of a supranational European "third force" and would hopefully have achieved a significant breakthrough in the resolution of the German problem. The contributing factor to such a political resolution of the German question would be the negotiated and mutual reduction in the force sizes of the Warsaw and NATO alliances within which the Canadian forces would have been repatriated. By phasing out its obsolete nuclear strike capacity and working out with its former NATO allies its new military role, Canada would have established its land mass as a nuclear free zone and have pressed its allies to transform NATO from a North Atlantic alliance of a collective security type to a West European military group in whose defence planning Canada and the U.S.A. would play a consultative role. Thus European security would still be guaranteed in two levels, by the nuclear standoff between the Soviet Union and the United States and on the ground by conventional forces organized by the European community itself as a viable third force.

Apart from contributing to reduce the threat that East European countries feel from West Germany, Canada would have been pursuing its constant policy of developing economic relations with the individual communist countries, doing what it could to establish contacts and increase understanding. While its impact in the Soviet Union would not have been enormous, its encouragement of relations with the East European countries could be expected by 1980 to have yielded considerably greater fruits, complementing the Gaullist policy of bilateral economic, cultural and scientific co-operation with these countries.

With the United States, Canada by 1980 should have established its position as a distinctive and friendly neighbouring power, working clearheadedly and dramatically in the developing countries and acting as a creative, but not subservient, friend in the whole field of East-West relations. Canada might still co-operate with the United States in its military and strategic planning, but in such a way as to reduce American-Soviet nuclear tensions. NORAD would, in

other words, have become an agency of arms control in one of the areas of continuing nuclear tension. A greatly increased Canadian effort to communicate its world policy views to the American political arena and to American public opinion would have made it clear—and perhaps even had some impact on American policy—that Canada wanted to promote world security by spurring social and economic development in the third world, not repress all signs of Left Wing political developments. In the economic dimension of its relationship, whether by bilateral or, preferably by international action, Canada would have hopefully achieved the establishment of rules of procedure governing the operation of multi-national firms, in a way compatible with the national interests of host countries.

2. Implementation

To sketch a ten year programme outlining a significant shift in Canada's international role can set the targets and outline some major avenues of operation. What is next needed is some idea about the practicality of achieving such goals and implementing the particular policy alliance suggested. Implementation would require first of all policy planning on a similar scale by those with whom Canada is most intimately involved, our current NATO partners. By making it clear to them that there was no intention arbitrarily to withdraw troops and support, by showing that Canada's ultimate foreign policy objectives were being redefined with world interests very much in mind, by being willing to carry on discussions with our allies on the best means and timetable of implementation, the transition to a different international role should provide no major diplomatic difficulties for Canada or its allies. The willingness to take great pains with the transitional measures, scheduled over a number of years, would be even more crucial for our own military establishment. Personnel retraining would be but one aspect of a major and long term plan to redirect the national military capability as part of the global planning process.

3. International Acceptance

The success of a bold long-term revised policy such as this would largely depend on the acceptance that it generated in foreign capitals. I mean this not just in the sense that the implementation of this programme would require co-operation from other countries but also in the sense that the new policy would be designed to affect the behaviour of other countries. Whether it successfully affected their behaviour would depend on how credibly the new policy was presented.

Acceptance in the U.S.A. would principally depend upon maintaining or reaffirming Canada's image as an independent, friendly neighbour with his own role to play. It would be important, for example, to keep pointing out to the Americans the usefulness of Canada's non-dependence: its ability to carry out operations which the United States, for various reasons, unable to perform such as Cyprus peace-keeping, aid to Tanzania, trial relationships with China, open-door for Cuba on the West. It would furthermore be essential that the United States understood that differences in policy were due not to antagonisms but to different assessments of the international situation and the way to deal with it. Such a clear, positive, unemotional handling of the American relationship should make talk of "retaliation" or the U.S. imposing its policies on Canada of trivial consequence. If Canada's objective is clearly to adapt its own international role to the needs of the 1970's, then the American politician or diplomat or general would not need to cry alarm. Rather American officials should be encouraged to observe Canada's policy changing process and take part in working out the transitional measures in such a way as to meet their own short term adjustment needs. Considerable attention would thus have to be paid to educating American political and public opinion. There is no reason to suppose that, if moderately executed, the Americans would not find Canadian policy both intelligent and helpful in their own reassessment and adaptation to the needs of the coming decade.

In Europe there would be little difficulty with such small or neutral countries as Sweden, Switzerland, Denmark and Norway. With France it could be expected that such a policy once started along the path of implementation should enhance the chances of re-establishing fruitful diplomatic and economic relations. With most NATO members in Europe, there should be no great difficulty in working out an acceptable timetable of withdrawal—preferably on the basis of some equivalent Warsaw Pact arms reduction. Rather than creating a domino effect, creative long-term policy discussions could help these countries rework their own military arrangements. Canada would make it clear that her conception of her mobile peace-keeping military role would embrace Europe in any time of need. Military consultation and continued collaboration in joint defence production, arms standardization and other co-operative military arrangements would be encouraged. The only country likely to take exception to the overall Canadian strategy would be West Germany, always sensitive to any weakening of its bargaining potential with the Eastern bloc. Since one of the political aims of this type of strategic withdrawal from Europe would be precisely the encouragement of a rethinking of the whole German situ-

ation—opening negotiations on the status of Berlin, the boundaries of East and West Germany and some form of East-West German co-operation—Canada should be willing to take the lead in restoring this long-repressed problem to the top of the international negotiating agenda. As in our American relations, there is no need for such a declaration of intention to lead to violent reactions in Germany. Rather this should be conceived as an effort to have a significant impact on those elements of progressive opinion in Germany that could be encouraged to move in the necessary direction towards a European settlement.

The impact on the *communist world* should not be exaggerated. While it would obviously be acceptable to the Soviet Union to have Canada de-nuclearized the Soviets would still be primarily preoccupied with West Germany that, for them, would still be the dominant fact of European life. It could, however, be expected that a significant reduction of NATO conventional forces and such technical nuclear threats as the Canadian bomber capability would have some reassuring affect on East European public and elite opinion reducing their own feeling of need for a countervailing Warsaw Pact. While the impact of such perceptions would be very hard to measure, its potential force as a liberalizing element has been seen only last year in Czechoslovakia. In the short term at least, one could not expect very favourable official reaction from the East European capitals. The pronouncements by the military would be extremely sceptical since the very *raison d'être* of the Warsaw Pact and the Generals in command of it would be threatened by the reduced NATO aggressiveness.

Similarly one should expect that spokesmen of NATO's military organization would themselves be highly skeptical, if not openly antagonistic to the proposed revision of Canadian long term policy. Since these two organizations require their mutual threat to justify their continued existence, their spokesmen would thus not likely be overly enthusiastic. Once again, however, the need for clear, patient and persuasive explanation of the new foreign policy by government leaders and diplomatic representatives would be of prime importance. Once again, too, the style of reasonable negotiation in designing transitional measures should be enough to overcome foreign military opposition.

Summary

I have been arguing from an analysis of the current international situation and a projection of the world relationships over the next decade to a Canadian international role that by 1980 would establish Canada as a Great Aid Power. Working back from

the way Canada would by that time be acting in the major areas of policy, we come to a programme of action centred round the revision of NATO that will by then have lived its twenty year term to an end. Canada would serve notice to its fellow members that its ten year policy was to proceed with a phased restructuring of its international role in collaboration with its NATO partner with the above-mentioned long-term aims in mind. One would anticipate spending a year in discussions with the NATO powers on the many range of long-term planning issues that such a ten year proposal would generate in the other political systems. As joint policies worked out, withdrawals could proceed. As progress was made in adapting to the Canadian phasing out, European forces could introduce their next generation of conventional military equipment. While the necessary steps and stages could be spelled out in greater detail, enough has been said to indicate that the choice before Canada in the immediate short term need not be phrased in the high confrontation style of immediate withdrawal from NATO. A profoundly rethought long term policy can, in other words be implemented in a manner that does not rouse antagonisms or retaliation from those whom it will ultimately affect—and, in my view, benefit.

Political Acceptability

Having asked how such a long term foreign policy adjustment would be implemented and how acceptable it would be to the major powers and allies, one still has to evaluate this proposal in terms of the Canadian political situation. Is such a programme acceptable? I can best answer this by dealing with the obvious questions that come to mind:

— Would this be considered by the older and more conservative segments of the population as too radical a break with previous foreign policy? The answer in practice would as we have seen in other cases above depend largely on the way that such a policy was presented to the Canadian public. It seems to me that it is entirely consistent with the Canadian international tradition. It does not try to cut off Canada from the North American continent and float it out to sea; it does not claim that Canada should be a non-aligned country in the Yugoslav or Indian pattern. It explicitly accepts the maintenance of a very considerable international responsibility vastly increasing the productive elements in our foreign relations—economic aid—which informed and articulate public opinion universally approves. It would in no way be stabbing our allies in the back since no commitment relating to NATO would be broken. Indeed it should be considered as highly responsible Canadian statesmanship to raise the question of the future of NATO in terms of the long-term perspective. It would not leave any currently defended sector of the NATO shield un-

defended since it would allow ample time for re-grouping to take place. It would in other words be in the best tradition of Canadian diplomacy: a proposal aimed at creative change and implemented by multilateral negotiation.

— Would it be seen as too anti-American? There is no reason why it should, except by those who blindly accept as God-given everything that is at the moment American policy. It has after all been characteristic of our relationship for our two countries to have significant differences in our strategic analysis and in our view of our respective national interests. Twice since 1914, when the United States was defending an isolationist policy and did not perceive the major international threat before her, Canada went to war notwithstanding her neighbour's isolationism. Twice since 1959, when the United States over-reacted to a perceived threat, Canada stood its ground (Cuba and the Dominican Republic). There is no reason it should be thought that such a constructive initiative should endanger the American relationship.

— Would this policy programme be acceptable to French Canada? There is every reason to believe so. Anti-communism is no longer a dominant concern there, NATO has long been considered an essentially Anglo-American operation particularly as Canadian forces' symbolism is so strongly bound up with the monarchy. For those who look to substantial French relations for inspiration and support in Quebec's development, the de-nationalization of Canadian foreign policy should be an especially positive feature. Apart from the separatists who might want to nourish Paris-Ottawa hostilities, improved relations between these capitals should be seen by the French Canadian as a significant proof of the desire to make Canadian foreign policy express the bi-national character of Confederation. As for the other side of the coin—vastly expanded aid operations—these would clearly be directed in large measure to social, economic and political support of Francophone countries, with the employment opportunities for French Canadians that such aid would provide.

— What of Canadian youth? As someone who is professionally involved with the most articulate members of the new generation, I have no hesitation in affirming that such a foreign policy adequately explained would be over-whelmingly supported by Canadian youth for whom NATO has lost almost all credibility as symbol for all that is out of date and irrelevant in Canadian foreign policy. The expansion of the Canadian aid industry would furthermore offer them prospects of creative employment in fields that could harness their idealism expressed at

the moment in the expanding interest in university courses on the third world.

— But what of the military? Many would feel their jobs threatened. Many would be discouraged that, so soon after the tri-service unification had shaken up the military establishment, yet another policy change was to be implemented. This calls for every understanding and consideration in the re-training and re-employing of those whose jobs might be displaced. But if we are to believe the testimony of the previous military experts, the extremely high ratio of non-fighting to fighting men that characterizes our forces might indicate that the phased reduction of Canada's military activity would affect more people in civilian type activities than actual fighting troops. Re-training for new equipment and defence roles is in any case so much a continuing characteristic of military life that there should be little difficulty in adapting to a full-scale peace-keeping capability.

If this proposal is, then, politically acceptable, as well as internationally acceptable are there any further objections that might be raised? The only serious one that I can envisage is the economic query: what would this do to our military-industrial complex? Joint defense production agreements account, after all, for some 400 million dollars of business, the rough equivalent of our imports of military equipment from the U.S.A. In the long term, defense production might be expected to diminish as a significant element in the economy, since buying less American arms might reduce U.S. willingness to allow Canadian firms (or American subsidiaries) to place bids on U.S. defence contracts. By the same token, however, government investment in aid operations would have the equivalent impact on the economy—on the reasonable political assumption that Canadian aid would continue to be tied. The implication of this on the economy is that the shift in Government spending priorities would stimulate research and development in areas of much greater social importance (new dietary products, mass birth control, agricultural techniques, maritime food production) than rocket launchers, or green berets.

Conclusions

Twenty years ago Canada took the lead in inventing and negotiating the establishment of the North Atlantic Treaty Organization to meet what was felt to be a major international need: a regional collective security arrangement. Now that this organization has fulfilled its purpose, Canada has a similar chance to take the lead in attacking the major economic, political and moral problem that now confronts the

APPENDIX TT

CANADA'S ROLE IN LONG-TERM WORLD PERSPECTIVE:
A PROPOSAL FOR A NEW INITIATIVE

by Stephen Clarkson,
Dept. of Political Economy,
University of Toronto.
March 6th, 1969.

Summary

The foreign policy review is being turned on its head by having to make a decision on NATO *before* the basic reappraisal is made of Canada's role in the world. Rather than the reformulation of a general foreign policy approach for the years ahead determining our attitude to North Atlantic security, a decision on NATO will beg the important questions of the foreign policy review.

The political stakes of the foreign policy review are high: the credibility of participatory democracy, the locking of Canadian foreign policy into what will be its mould for the Trudeau era. Thus the effectiveness of Canadian foreign policy as a nation-building instrument will be determined by whether French, English, new and young Canadians will find in it an expression of their national identity.

Canada has a great opportunity to change its foreign policy:

— our allies are prepared for the new Government to make changes;

— NATO is in any case ending its first twenty years and so must be reassessed.

This paper urges the Committee to decide its military policy only after:

1. appraising the *major international threats* as they are today and evaluating the probable shape of the world's problems by 1980 (declining communist threat, continuing nuclear menace, growing economic disparity between industrialized and under-developed countries, continuing sporadic local and civil wars in the third world);

2. identifying the nature of *Canada's national interests*, both its external long-term interests (peace which allows progressive change in the third world, prosperity which reduces the gap between rich and poor nations and a limit to the escalation of the nuclear arms race) and its internal needs (a distinct Canadian identity to be promoted by a coherent

National Policy integrating social and economic policies with a clear view of Canada's role in the world and relationship with the United States).

In the light of this analysis of the projected international situation and Canada's continuing national interests, a ten-year foreign policy programme for the seventies is proposed.

Keeping its expenditures for foreign relations (defence and foreign aid) a constant proportion of the gross national product, we should simply switch the military and aid allocations so that by 1980 Canada would be spending 2% of GNP on aid and .5% on defence. Canada was a leading military power in the late '40's. This programme would re-establish Canada's role as a major contributor to world stability by making her a leading world aid power by 1980.

Canada's military role would be specialized as a peace-keeping and disaster relief force highly flexible and mobile, able to move anywhere on the globe—Europe included—when requested and needed.

Canada's aid activity would concentrate on those countries in the developing areas where aid would have the greatest potential impact: particularly Francophone and English-speaking African countries and the Caribbean.

The long-term foreign policy target would be implemented by as long a transitional process as required by the defence needs of our allies with whom the transition would be negotiated.

The paper concludes by demonstrating the high degree of acceptance such a programme would receive within the North Atlantic community and within the Canadian political system, on condition that it is presented as what it is: consistent with Canada's best tradition of responsible international leadership at a watershed in the world's political development. What Canada did in 1948/9 for European security, we can do again for world economic stability.

APPENDIX TT

CANADA'S ROLE IN LONG-TERM WORLD PERSPECTIVE:

A SUPPLEMENTARY NOTE

Stephen Clarkson
Dept. of Political Economy
University of Toronto

*A General Conception of
Canada's International Role*

For twenty years Canada's foreign policy has been defensive, both in the literal sense that it has been centred round defence—as can readily be seen by the size of our defence budget relative to national expenditures on other foreign policy activities—and in the figurative sense that our international role has been largely deferential to American policy. "Quiet diplomacy" has been the slogan for the Canadian foreign policy doctrine conceived as a basic support for and reflection of the policies of the Western alliance. Particularly in the latter years U.S. relations have been thought of as a one-way street, in which retaliation has been the major obsession and hence foreign policy was conceived as a reaction within the limits imposed by the direction of U.S. policy.

However such a conception may have been justified in the past by the pressures of the Cold War and inherent Canadian feelings of inferiority and dependence in an insecure world, the conditions in which Canada must redefine its general conception of its world role have changed:—There is less automatic faith in the wisdom of American foreign policy.—There is a greater self-confidence by Canadians in their own abilities to tackle and resolve their own policy problems.

The time has now come for us to conceive Canada's world role as an *active and creative foreign policy* by which Canada takes initiatives and leadership in confronting world problems. In particular this means we should realize that Canada can play its most important roles in influencing American foreign policy by taking leads that the American president cannot himself initiate because of internal political pressures or external formal commitments. Rather than playing an obstructionist Gaullism from outside the circle of Western friends, Canada can play an independent and so more influential role by staying within the Western alliance but initiating new efforts to resolve fundamental and persisting problems.

Canada should, in other words, exploit the importance of its unimportance and use its lack of international commitments round the world to provide

international leadership which the Americans can then follow.

Biographical Sketch

Stephen Clarkson was born in London in October 1937 and educated in Toronto. He graduated from the University of Toronto in history and languages in 1959, went to Oxford as a Rhodes Scholar where he studied politics and economics and did his doctorate in political science at the University of Paris' Fondation Nationale des Sciences Politiques.

From 1964 he has been teaching comparative politics at the Department of Political Economy of the University of Toronto where he is now associate professor.

His main field of academic research is the Soviet theory of under-development. He has published articles on this subject in the journals *Problems of Communism*, *International Journal*, the *Canadian Journal of Economics and Political Science* and the *Economic and Political Weekly*. His book, *L'analyse soviétique des problèmes indiens du sous-développement*, will be published this year. He spent 1967-68 at the Research Institute on Communist Affairs, Columbia University and two months last summer in the Soviet Union continuing this research.

His publications on Canadian problems include:

"A Programme for Bi-national Development", in Peter Russell, ed., *Nationalism in Canada*, Toronto: McGraw-Hill, 1966. "Charting a Course for Canadian Foreign Policy", *Globe and Mail*, July 12, 1967. "The Politics of Economic Dependence", a Study for *Watkins Report*.

He was programme chairman on Canadian foreign policy for the University League for Social Reform for whom he edited *An Independent Foreign Policy for Canada?* Toronto: McClelland & Stewart, 1968.

He is on the Board of Editors of the *Canadian Forum* to which he has contributed regularly.

He is fully bilingual.

Clerk of the Committee.

Pursuant to Standing Order 65(4) (b):

¹Mr. Fairweather replaced Mr. Asselin on March 24, 1969.

ORDERS OF REFERENCE

HOUSE OF COMMONS,
THURSDAY, January 16, 1969

Ordered,—That the Standing Committee on External Affairs and National Defence be instructed, to hear evidence on and to consider Canada's policy with reference to defence and external affairs.

MONDAY, March 3, 1969.

Ordered,—That the Members of the Standing Committee on External Affairs and National Defence be granted leave to travel outside Canada between March eighth and March twenty-second, 1969, for the purpose of furthering their work; and that the necessary staff accompany them.

ATTEST:

ALISTAIR FRASER,
The Clerk of the House of Commons.

REPORT TO THE HOUSE

WEDNESDAY, March 26, 1969.

The Standing Committee on External Affairs and National Defence has the honour to present its

FIFTH REPORT

Pursuant to its Order of Reference of Thursday, January 16, 1969, your Committee has heard evidence on and has considered Canada's policy with reference to defence and external affairs.

Your Committee held 24 meetings in Canada from January 21, 1969 to March 25, 1969, and heard the following witnesses (listed in order of appearance before the Committee):

1. Mr. John Gellner, Editor, the *Commentator*, Toronto.
2. Dr. O. M. Solandt, Chairman, Science Council of Canada.
3. Dr. Raymond D. Gastil, from the Hudson Institute, Inc., Croton-on-Hudson, New York.
4. Mr. Robert A. Krupka, from the Hudson Institute, Inc., Croton-on-Hudson, New York.
5. Major General M. R. Dare, Deputy Chief Operations and Reserves, Canadian Forces Headquarters.
6. Professor Adam Yarmolinsky, Harvard Law School, Cambridge, Massachusetts.
7. Professor James Eayrs, Department of Political Economy, University of Toronto.
8. Professor Charles Foulkes, Visiting Professor, School of International Affairs, Carleton University, Ottawa.
9. Professor Michael Brecher, Department of Economics and Political Science, McGill University, Montreal.
10. Professor Kenneth McNaught, Department of History, University of Toronto.
11. Mr. David Golden, President, Air Industries Association of Canada.
12. Professor John W. Warnock, Department of Economics and Political Science, University of Saskatchewan, Saskatoon.
13. Professor Albert Legault, Visiting Professor, Chair of Strategic Studies, Queen's University, Kingston.
14. Dr. Theo Sommer, Deputy Editor and Foreign Editor of *Die Zeit*, Hamburg, Federal Republic of Germany.
15. Professor J. L. Granatstein, Assistant Professor of History, York University, Downsview, Toronto.
16. Professor Stephen Clarkson, Department of Political Economy, University of Toronto.

The Order of Reference of March 3, 1969 granted leave to the Members of the Committee to travel outside Canada between March 8 and 22, 1969, for the purpose of furthering their work. Accordingly, the Members visited Europe as an integral part of the Committee's consideration of Canada's defence policy and concluded the first phase of the overall review of defence policy that began in January. The Members of the Committee visited Cyprus, the Federal Republic of Germany, Great Britain, Switzerland, Sweden, France and Belgium.

Members met and held discussions with many prominent persons. These included the President of Cyprus, the Secretary General of NATO, Defence and Foreign Ministers of a number of countries visited, NATO civilian and military officials including the Supreme Allied Commander in Europe, political leaders and representatives of all parties in countries visited, officials of foreign and defence ministries, Canadian and foreign military officers, Canadian representatives in Europe, representatives of important research institutions such as the Institute for Strategic Studies and prominent journalists and political commentators.

The following documents were printed as Appendices to the Minutes of Proceedings and Evidence:

- Z —Proposed Programme for Standing Committee on External Affairs and National Defence and Programme: Phase I.
- AA—Text prepared by Mr. John Gellner and his biographical sketch.
- BB—Biography of Dr. O. M. Solandt.
- CC—The Effectiveness of Civil Defence—by Raymond D. Gastil and Robert A. Krupka and biographical sketches on Dr. Gastil and Mr. Krupka.
- DD—Biography of Major General M. R. Dare.
- EE—Text prepared by Professor Adam Yarmolinsky and his biographical sketch.
- FF—Future Roles for the Armed Forces of Canada—notes prepared by Professor James Eayrs and Professor Eayrs' biographical sketch.
- GG—A Canadian Response To Collective Security—by Professor Charles Foulkes, and Professor Foulkes' biography.
- HH—Neutrality: An Analysis—by Professor Michael Brecher, and Professor Brecher's curriculum vitae.
- II—Non-Alignment For Canada—by Professor Kenneth McNaught, and Professor McNaught's curriculum vitae.
- JJ—List of Bilateral Defence Agreements Between Canada and Other Countries.
- KK—Letter to Professor McNaught dated July 31, 1967, from the Director, Home Branch, Department of Manpower and Immigration, Ottawa.
- LL—Canadian Defence Policy and the United States—by Mr. David Golden, and Mr. Golden's biographical sketch.
- MM—Text prepared by Professor John Warnock, and his biography.

NN—Text prepared by Professor Albert Legault, his biography, and list of publications.

OO—Biography of Dr. Theo. Sommer.

PP—Text prepared by Professor J. L. Granatstein, and his curriculum vitae.

QQ—Speech by the Hon. Léo Cadieux, delivered January 27, 1969.

RR—Speech by the Hon. Mitchell Sharp, delivered February 20, 1969.

SS—Speech by the Hon. Mitchell Sharp, delivered March 1, 1969.

TT—Text prepared by Professor Stephen Clarkson, and his biography.

In addition, a number of submissions were received from interested citizens and organizations. Only those submissions which were supported by a direct appearance before the Committee have been included in the formal records of the Committee.

PART I

Scope of Preliminary Report

The Committee's Order of Reference of January 16, 1969 authorizes a thorough review of Canada's policy with reference to defence and external affairs. The Committee intends to continue its present review of defence policy after the Easter recess.

Although its work is not complete, the Committee thinks it desirable to make this report, including recommendations with regard to Canadian participation in the North Atlantic Treaty Organization (NATO), before the Government announces its policy with reference to NATO on or before April 10, 1969 when the North Atlantic Council meets in Washington.

Canada and the United Nations

Canada's territory is not directly menaced by threat of invasion by any other nation. Nevertheless Canada would be seriously affected in any world conflict and shares with all other nations a vital interest in the maintenance of peace, world order and stability. Canadians therefore need a peaceful world order—one which is not static but rather one that will permit and encourage change, so that peoples of the world can live peacefully and the largest possible measure of freedom and equality of opportunity.

The achievement of such objectives through collective security was one of the purposes for which the United Nations was founded after the Second World War. Unfortunately, for a number of reasons, hopes for world peace through the United Nations have not yet been realized.

Canadians are enthusiastic supporters of the United Nations as one of the best possible ways to achieve the type of world order which they desire. The Committee believes that all United Nations members should apply even more leadership, ingenuity and effort to assist the evolution and development of the United Nations so that it can effectively achieve collective security through the establishment and enforcement of the rule of law in international affairs.

Canada's Existing Alliances

Canada's defence policy since the Second World War has been based upon alliances—notably the North Atlantic Treaty Organization (NATO) and defence arrangements with the United States including the North American Air Defence Command (NORAD). Such alliances are contemplated by Article 51 of the United Nations Charter.

NATO

The North Atlantic Treaty was signed on April 4, 1949 and the organization now consists of Belgium, Canada, Denmark, the Federal Republic of Germany, France, Greece, Iceland, Italy, Luxemburg, the Netherlands, Norway, Portugal, Turkey, the United Kingdom and the United States. The organization resulted largely from a reaction of its members to the rapid expansion of Russian territory and influence after the Second World War and from fears of further Russian aggression and subversion of Western Europe.

The Treaty did not itself impose specific military commitments upon any of its members. Article 5 of the Treaty recognized that assistance might be military or non-military the nature of any military forces to be maintained by each of the members was left to the discretion of such member and the Treaty itself made no provision for the pooling of military forces or any integrated or joint command. Very soon, however, procedures and institutions were developed under the Treaty pursuant to which member countries undertook to provide military forces and to integrate these forces under a unified command.

The Treaty provides that after it has been in force for twenty years, any party may give written notice of withdrawal. Withdrawal becomes effective one year after such notice has been given. The treaty came into force when it was ratified by a majority of the original signatories on August 24, 1949. Accordingly, at any time after August 24, 1969 any member can withdraw on one year's notice.

NORAD

The agreement between Canada and the United States for formal establishment of the North American Air Defence Command was signed May 12, 1958. Originally it was effective for a ten-year period. It was renewed on March 30, 1968 for a further five-year period. However, it can be reviewed at any time and following such review it may be terminated by either Canada or the United States on one year's notice.

Basically the NORAD agreement sets up an integrated command for the planning operation of the air defences of Canada and the Continental United States. The Commander-in-Chief is an American. The Deputy Commander is a Canadian. They are responsible to the Joint Chiefs of Staff of the United States and the Chief of the Canadian Defence Staff who in turn are responsible to their respective governments.

The NORAD Agreement does not impose any specific obligation on either country to allocate military forces to the NORAD Command. The NORAD Command includes only such individuals and combat units as the two governments from time to time choose to allocate to it.

Because the Committee intends to continue its review of NORAD in later hearings it decided not to include in this report any recommendations with regard to NORAD.

Canada's Present Military Contributions to NATO

Canada is providing a fully mechanized brigade group which now has a peacetime strength of approximately 6,000 men. The brigade is equipped with a variety of modern mechanized equipment, most of which is of recent origin and includes two Honest John launchers armed with short-range nuclear warheads. However, the Centurion tanks have seen heavy service and the Committee was informed that for this reason they would require replacements in the early 1970's. The 4th Canadian Mechanized Brigade Group, with its headquarters in Soest, Germany, forms a part of the British Army on the Rhine, which in turn constitutes a part of the Northern Army Group, which is responsible for defending the North German plains.

Canada has also committed an Air Division in Europe. The 1st Air Division is at present organized in 6 squadrons of Canadian-built F-104 aircraft. These are divided into 4 squadrons of strike-attack aircraft, capable of carrying nuclear or conventional weapons, and 2 squadrons of reconnaissance aircraft, which also have a limited conventional attack capability. The Committee was informed that these aircraft will probably remain serviceable until the mid 1970's. The complement of the Air Division, once the squadrons are concentrated on two bases, will be approximately 3,800 men. Its headquarters is in Lahr in Southern Germany and it forms part of the 4th Allied Tactical Air Force in Central and Southern Germany.

Canada also makes available to NATO for service in Europe a brigade of air-transportable troops which are based in Canada.

Canada's East Coast maritime forces are earmarked to NATO and would be assigned to Supreme Allied Command Atlantic (SACLANT) in an emergency. These forces include 1 aircraft carrier, 15 destroyer escorts, 3 submarines and 26 long-range Argus aircraft. Forces on the West Coast can also be assigned to NATO. They comprise 5 destroyer escorts, 1 submarine and 4 Argus aircraft.

The Committee visited the headquarters of the 1st Air Division and the mobile headquarters of the 4th Canadian Mechanized Brigade Group. All members of the Committee were impressed by the dedication and professional competence of the Canadian officers and men wherever they were serving. These Canadian forces are all highly regarded by the other forces with whom they are associated and are establishing a very favourable reputation for Canada.

PART II

Is Neutrality a Possible Policy for Canada?

While most witnesses believed that Canada should continue to participate in defensive alliances, a few have advocated Canada's withdrawal from alliances and the adoption of neutrality or a policy of non-alignment. These witnesses stated Canada was not menaced from abroad; they felt that the prime danger arose from involvement in any conflict between the alliances; and they argued that Canada could play a more independent and influential international role as a neutral or non-aligned nation.

The Committee had an opportunity to assess the validity of this argument in Sweden. They were impressed by the Swedish conviction that their defence forces must be capable of providing a balanced defence of the whole country

with forces sufficient to make any attack by an aggressor unprofitable. The Swedish analysis assumes that their territory is of only marginal interest to the Great Powers and they depend on NATO to offset the power of the Warsaw Pact. Finally, they believe their defence system must be sufficiently effective to convince the Great Powers on both sides that Sweden will and can fulfill the obligations of a neutral state. This policy involves compulsory military service and much higher defence costs than Canada is now incurring.

The Committee concludes that neutrality would not be possible for Canada because of our proximity to the United States and the fact that we live directly between the United States and the Soviet Union. Swedish experience, moreover, indicates that to have Canada's neutrality respected by both Great Powers would require prohibitively costly defence expenditures.

Should Canada Rely Solely Upon United States Protection?

It has been argued before the committee that Canadian defence expenditures can be substantially reduced because of the fact that Canada's geographical proximity to the United States makes it necessary for the United States to defend Canada in order to defend itself. This has been referred to as the "free ride" theory.

The Committee does not accept this theory. On the contrary, it is convinced that Canada must be prepared to incur reasonable expenditures for its own defence in order to maintain its independence and freedom of action as a nation, and to ensure that Canadian interests are taken into account when continental defence measures are being considered. The committee recognizes that Canada's geographical position as the neighbour of a super-power, the United States, does indeed confer certain advantages. One of these is that it frees Canada from the need to maintain a complete range of defensive equipment and thereby enables Canada to make a contribution to world security which in the broadest sense is also a contribution to her own security in other fields.

Can Foreign Aid be a Substitute for Defence Expenditures?

A few witnesses urged that Canada should reduce very substantially its defence expenditures and use the defence dollars so saved to increase aid to developing countries. The Committee is not satisfied that defence and aid expenditures should be interdependent. Expenditures to assist developing countries are desirable and Canada should be generous, but such expenditures do not, at any rate in the short term, provide security for Canada and therefore are no substitute for defence expenditures. This is, however, a topic which the Committee hopes to examine in the future.

Should Canada Concentrate on United Nations Peacekeeping?

Evidence presented to the Committee indicated that, in the future, United Nations peacekeeping operations would not be likely where the intervention of a peacekeeping force would be adverse to the interests of any of the Great Powers, whose approval in the Security Council would not otherwise be forthcoming. They would be required, however, when such interests were not involved, where the Great Powers had an interest in seeing stability in the area maintained, and when the host state was ready to extend the necessary invitation.

The Committee had the opportunity to visit the United Nations peacekeeping force in Cyprus. It was impressed by the spirit of co-operation among the national units making up the United Nations force and particularly by the efficiency and morale of the Canadian contingent (3rd Battalion, Royal 22nd Regiment) and by the respect for it which prevails not only among United Nations officials, but also among Greek and Turkish Cypriots. The Committee is satisfied that, in Cyprus, the Canadian peacekeeping forces are fulfilling a most useful and worthwhile role and making a valuable contribution to Canada's reputation abroad.

While some witnesses suggested that Canada's attractiveness as a state able to provide peacekeeping forces might be marginally increased if Canada were not a member of NATO, the more persuasive testimony suggested that any disadvantages were compensated for by certain advantages as a peacekeeper which NATO membership conferred on Canada. The record also indicates that NATO membership has not led to Canada's exclusion from any peacekeeping operation. The Committee accordingly concludes that NATO membership does not inhibit Canada from playing a useful peacekeeping role through the United Nations. Moreover, certain forces earmarked for NATO are also earmarked for United Nations service, so that no extra costs are involved in filling these two tasks.

What is the Effect of Alliance Membership on Canada's Influence?

A number of witnesses urged that Canada should withdraw entirely from its alliances on the ground that our continued membership makes us suspect with the non-aligned or developing countries of the world. As a member of alliances, it was asserted that Canada's influence with the nations of the "third world" is much less than it would be if we withdrew from them completely, our credibility as an independent nation at the United Nations is undermined and our acceptability in peacekeeping operations is seriously impaired.

Other witnesses who appeared before the Committee adopted an argument opposite to that outlined above. They advocated continued active participation by Canada in NATO on the ground that NATO provides the principal forum within which to exercise an influence on the trend of events in the area of the world where there is the greatest risk that local conflict could escalate into a nuclear exchange. Some of the witnesses further maintained that Canada's close association with the United States and other NATO countries was favourably regarded by some non-aligned states who believe that Canada can serve as an intermediary with these countries.

The Committee concludes that Canada's influence with other nations of the world, including the non-aligned and developing nations, its influence at the United Nations and its acceptability in United Nations peacekeeping operations will be determined more by the degree of independence, objectivity and fairness which Canada exhibits in its relations with other countries than by its alliance associations.

The Committee further notes that a neutral state such as Sweden does not appear to derive for that reason more influence with other nations than does a comparable state in NATO such as Canada. While the Committee finds it difficult to assess intangibles such as influence, it concludes that Canada derives advantage from being able to put its views forward in the NATO forum where issues affecting European and world security are discussed and decided.

Is NATO Necessary?

Conflicting arguments were presented to the Committee with regard to the continuing importance of NATO. Some argued that Russia remains aggressive and expansionist, e.g., Czechoslovakia. NATO provides more effective and economical protection than could be provided by any of the NATO countries acting individually.

Some argued that NATO makes unnecessary the proliferation under national control of nuclear weapons among the nations of Western Europe which do not now have them, so long as the United States' nuclear deterrent is available to protect all countries of the Alliance. Witnesses in France argued otherwise.

It was also argued that NATO's continued existence was particularly important because it provided security within a collective framework to West Germany. This makes it unnecessary for West Germany to seek her own security by bilateral military alliances or by building up military strength or a national nuclear capability—a process which would alarm her neighbours and create instability in Central Europe.

It was further suggested that NATO was necessary as an instrument to co-ordinate plans for the mutual reduction of the arms confrontation in Europe and negotiations with the Warsaw Pact countries on other measures of détente.

Others argued that the urgent need for a defensive military alliance in Europe had disappeared as the threat of an all-out invasion of Western Europe had become more and more unlikely with the emergence of the nuclear stalemate. Such a stalemate, it was said, would effectively deter military adventures in Europe. Indeed some even maintained that the continued existence of NATO was provocative, perpetuating the Warsaw Pact and militating against the development of liberal tendencies within Eastern Europe.

Having considered these arguments, the Committee concludes that the military strength of the Warsaw Pact is greater to-day than ever before and that NATO continues to offer the most effective means of providing for the security of Western Europe. The Committee is also impressed by the extent to which the NATO Council has become a focus of political consultation and they believe NATO can and should be a useful instrument for promoting détente with the Soviet bloc.

Is Canadian security involved in Europe?

Many witnesses maintained that, by making forces available for the defence of Europe, Canada is contributing directly to its own security. They argued that, in the words of one witness, the "fault line of confrontation" between the Soviet bloc and the NATO alliance crosses through the middle of Europe. In this situation spontaneous outbreaks or accidental conflicts unless they are quickly and effectively controlled, could speedily escalate into a destructive nuclear exchange, in which Canada and her territory would inevitably be affected. The presence and availability for immediate use of adequate conventional NATO forces in Europe is important to provide a credible deterrent and time for negotiation in the event of limited hostilities. In the view of these witnesses, a pre-meditated all-out nuclear attack on North America was unlikely and the principal risk of nuclear war—which was the only kind of war in which Canadian territory would suffer directly—lay in escalation of conflict in Europe.

The Committee accepts this argument.

Is Canada Over-Spending on Defence?

Several witnesses have argued that Canada is spending too much on defence. Others have reached the same conclusion by pointing to the fact that Canada is the only Alliance member other than the United States to provide forces in three theatres: in Europe, at sea and for the defence of North America. Some witnesses limited their comments to recommending a reduction, on the ground that Canada is not directly menaced. Others advocate transferring the savings to foreign aid, and still others to domestic development.

The Committee found this to be a difficult question to assess objectively. The yardstick used most widely is a calculation which involves relating defence expenditure to per capita gross national product. By this standard of comparison, Canada's total defence expenditure in all theatres, and including peacekeeping, is now one of the lowest in NATO, whereas when Canada first sent forces to Europe in the early 1950's its contribution was one of the highest. But the Committee found this standard imprecise because it includes expenditure for large internal security forces maintained in some countries; for military activity carried on by others outside the NATO area; and does not distinguish among differing requirements for development funds.

The Committee believes that by comparison with other nations both inside and outside of NATO, Canada's defence expenditures are not disproportionately high. And while Canadian forces are spread over three theatres within NATO, the forces maintained in each are not excessive. The Committee considers that further conclusions regarding the nature and location of Canadian defence activities must be based on political and security considerations. The foregoing does not mean that the Committee has reached the conclusion that savings in defence expenditures cannot or should not be effected.

Does NATO provide An Effective Forum?

The Committee had an opportunity to learn from experienced witnesses in Europe that the NATO Council provides an effective forum for political consultation. In this process, which is being steadily expanded, the views of the smaller nations, especially when they act in combination, can be much more persuasive than if they are advocated bilaterally.

Would Canada's Withdrawal Seriously Damage NATO?

Repeatedly arguments were made to the Committee that, if Canada withdrew its forces from Europe or substantially reduced them, the United States or the Western European states might follow suit and NATO might be seriously weakened as a result of such a Canadian initiative—that Canadian action might have a "domino" or "catalytic" effect.

Advocates of this argument who were concerned about a United States withdrawal from Europe placed special importance on the continued physical presence of substantial numbers of American forces in Europe. These forces were needed in part to assure Europeans that the United States, which was no longer invulnerable to Soviet nuclear attack, was determined to deter a Soviet move against Western Europe by whatever means might be necessary. In the view of several witnesses, Western Europe without United States support, would be obliged by its geographic location to accept a degree of political subordination to Russia. These advocates feared that, should Canada withdraw its forces from Europe, this example could be used by those political groups in the United States who are pressing for similar action by the United States.

Those who feared a "catalytic" effect in Europe suggested two possibilities: certain European countries with budgetary problems might follow Canada's example; and Germany might feel the need to replace any forces which were withdrawn, thereby further increasing its now relatively large military contribution to the Alliance. Several witnesses spoke of the shock which would follow such a move by Canada; since Canada had a high reputation for responsibility and good judgment, its example would influence others.

Some witnesses in Europe spoke of the psychological effect of such action by Canada on Russia. It was asserted that even if forces withdrawn by Canada were replaced by equivalent forces provided by another country, so that NATO's military power was unchanged, the deterrent effect of NATO on the Russians would be reduced.

The Committee recognizes that this is a difficult question on which to make a categorical judgement. However, the Committee considers that the withdrawal of Canadian forces—depending on how or when this were to be accomplished—might have some or all of the adverse effects suggested above.

Would Basing of Existing Forces in Canada for Service in Europe Be Feasible?

The question was raised as to whether Canada should withdraw its forces from Europe, but maintain them in their present form in Canada for dispatch to Europe in an emergency.

The Committee had ample opportunity to examine this suggestion. They ascertained that this approach would diminish the effectiveness of the training programme; that it would require the stockpiling of heavy equipment in Europe; that it would require considerable additional costly air transport; that it would not achieve any significant economies in operating costs; that the military utility of such forces in time of crisis was uncertain and their return to Europe might be provocative; and that accordingly the other members of NATO would attach considerably less importance to such a contribution from Canada. The Committee accordingly concludes that there is no advantage to be gained from transferring Canada's existing forces in Europe to Canada, while maintaining them in Canada for service in Europe in an emergency.

What Should Be the Role of Canadian Forces in Europe?

This is one of the most important questions faced by the Committee. However, it does not have sufficient evidence upon which to form a judgment. The only definite suggestion made for a change in role was to replace our present forces in Europe with a light conventionally-armed air-transportable force. The Committee did not have sufficient evidence as to what the use and value of this force would be, nor did it have expert evidence in regard to what other roles might be open to Canada. The Committee will pursue its inquiries into this whole question with a view to making definite recommendations in a future report.

PART III

Having assessed the arguments presented to it, the Committee submits the following recommendations which flow from its assessment of the various arguments examined in Part II.

1. Canada should continue to play an effective role in the preservation of peace through membership in NATO.

2. Canada should continue to maintain forces in Europe as a contribution to the collective defence arrangements of NATO.
3. Canada should continue its present roles in Europe until such time as the main items of equipment for its Air Division and Mechanized Brigade require replacement.
4. The future long-term military roles of Canadian forces assigned to NATO must be reviewed promptly, and kept under periodic review in the future by the Government and by this Committee, bearing in mind
 - (a) the desirability that our NATO forces should be as compatible as possible with our other forces.
 - (b) that decisions on roles must be arrived at in sufficient time to negotiate with our allies and, if necessary, to acquire new equipment and to retrain forces.
5. Through NATO, Canada should use its influence to seek détente in Europe and, while maintaining security, negotiate balanced force reductions as recommended by the Harmel Report.

Up to the present time, the Committee has not obtained sufficient evidence with regard to Canada's Maritime forces, which are earmarked to NATO, to permit it to include recommendations with respect to them in this report. This subject will be investigated in the course of the Committee's continuing defence review.

The Committee has taken evidence in Canada and obtained information in Europe with regard to United Nations peacekeeping, Civil Defence and Disarmament. The Committee has decided however, to defer recommendations on these subjects to a later report.

A copy of the Minutes of Proceedings and Evidence relating to the Order of Reference dated January 16, 1969, (*Issues Nos. 19 to 35*) is tabled.

Respectfully submitted,

IAN WAHN,
Chairman.

The Standing Committee on External Affairs and National Defence met *in camera* at 11:05 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Brewin, Buchanan, Cafik, Carter, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, Lewis, MacLean, Marceau, Nesbitt, Nowlan, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch (28).

Also present: Mr. Groos, M.P.

Members of the Committee thanked the Chairman for his part in the European tour and he in turn thanked the members for their co-operation.

The Committee also expressed thanks to Mr. Peter Dobell, the Clerk of the Committee and members of the supporting staff. The Chairman was instructed to forward a letter of thanks through the Minister of National Defence, mentioning all DND personnel who accompanied the members on their tour.

The Members began their consideration of a working paper, to be used as the basis for a Report to the House.

The discussion continuing, the Committee adjourned at 1:00 p.m. until 2:00 p.m. this day.

AFTERNOON SITTING

(51)

The Standing Committee on External Affairs and National Defence met *in camera*, at 2:10 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Brewin, Buchanan, Cafik, Carter, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, Lewis, MacLean, Marceau, Nesbitt, Nowlan, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Stewart (*Marquette*), Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch (29).

Also present: Mr. Groos, M.P.

The Committee continued its consideration of the working paper.

At 6:00 p.m., the Committee adjourned until 8:00 p.m. this day.

EVENING SITTING

(52)

The Standing Committee on External Affairs and National Defence met *in camera*, at 8:15 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Brewin, Buchanan, Cafik, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, MacLean, Marceau, Nesbitt, Nowlan, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Stewart (*Marquette*), Thompson (*Red Deer*), Wahn, Winch (26).

Also present: Mr. Groos, M.P.

Members of the Committee continued their consideration of the defence review working paper.

At 10:00 p.m., the Committee adjourned until 9:30 a.m. on Tuesday, March 25, 1969.

TUESDAY, March 25, 1969

(53)

The Standing Committee on External Affairs and National Defence met *in camera* at 9:40 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Brewin, Buchanan, Cafik, Carter, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, Lewis, MacLean, Marceau, Nesbitt, Nowlan, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Stewart (*Marquette*), Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch (30).

Also present: Mr. Groos, M.P.

The Committee resumed its consideration of the working paper, to be used as the basis for its Report to the House.

At 12:30 p.m., with the discussion continuing, the Committee adjourned until 2:00 p.m. this day.

AFTERNOON SITTING

(54)

The Standing Committee on External Affairs and National Defence met *in camera* at 2:05 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Brewin, Buchanan, Cafik, Carter, Fairweather, Forrestall, Gibson, Guay, (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, Lewis, MacLean, Marceau, Nesbitt, Nowlan, Penner, Prud'homme, Ryan, Smith (*Northumberland-Miramichi*), Stewart (*Marquette*), Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch (30).

Also present: Mr. Groos, M.P.

During the afternoon sitting, the Committee completed its consideration of the working paper. It was agreed that the Chairman should present the document, as amended, as the Fifth Report to the House.

The Committee adjourned at 5:40 p.m., to the call of the Chair.

Hugh R. Stewart,
Clerk of the Committee.

HOUSE OF COMMONS

First Session—Twenty-eighth Parliament

1968-69

STANDING COMMITTEE

ON

EXTERNAL AFFAIRS and NATIONAL DEFENCE

Chairman: Mr. IAN WAHN

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 36

THURSDAY, APRIL 17, 1969

Respecting

Estimates, 1969-70, Department of National Defence.

Hugh R. Stewart,
Clerk of the Committee.

ORDER OF REFERENCE

HOUSE OF COMMONS
THURSDAY, February 20, 1969.

Ordered,—That Votes 1, 10 and 15 relating to the Department of External Affairs;

Votes 30, 35 and L35 relating to the Canadian International Development Agency;

Vote 40 relating to the International Joint Commission;

Votes 1, 5, 7, 10, 12, 15, 20, 25, 30, 35, 45, 48 and 50 relating to the Department of National Defence; and

Vote 55 relating to Defence Construction (1951) Limited be referred to the Standing Committee on External Affairs and National Defence.

ATTEST:

ALISTAIR FRASER,
The Clerk of the House of Commons.

THE HISTORY OF THE

REIGN OF

CHARLES THE FIRST

BY

JOHN BURNET

OF THE UNIVERSITY OF OXFORD

IN TWO VOLUMES

[Text]

MINUTES OF PROCEEDINGS

THURSDAY, April 17, 1969.

(55)

The Standing Committee on External Affairs and National Defence met at 8.10 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Cafik, Forrestall, Gibson, Guay (*St. Boniface*), Laniel, Legault, Lewis, MacLean, Marceau, Nowlan, Stewart (*Marquette*), Stewart (*Cochrane*), Wahn, Winch (16).

Also present: Mr. Roberts, M.P.

Witnesses: From the Department of National Defence: Dr. J. C. Arnell, Assistant Deputy Minister/Finance; Brigadier General A. McCaig, Director General Budget and Finance.

The Chairman read the Committee's Order of Reference dated Thursday, February 20, 1969.

The Chairman called Item 1 *Departmental Administration etc.* \$7,299,250 of the Estimates, 1969-70, Department of National Defence.

The Chairman introduced Dr. J. C. Arnell, Assistant Deputy Minister/Finance. Dr. Arnell made a short opening statement and was questioned by the Members; Dr. Arnell was assisted by Brigadier General A. McCaig, Director General Budget and Finance.

The Committee agreed to print the advance statement on the Estimates, including the list of Selected Major Equipment Items, prepared by the Department, as an appendix to this day's Minutes of Proceedings and Evidence (*See Appendix UU*).

Item 1 of the Estimates was allowed to stand.

The Chairman called Item 5 *Grants as detailed in the Estimates* \$546,375.

The Chairman reported the recommendations of the Subcommittee on Agenda and Procedure which met on Tuesday, April 15, 1969. He outlined the schedule of meetings which is planned for a review of the National Defence and External Affairs Estimates, and a program for the next phase of the Defence Review. Members made additional suggestions which will be considered by the Subcommittee.

Members questioned Dr. Arnell, under *Item 5* of the Estimates. Mr. Allmand requested a written report containing additional information on the grants to *Canadian Universities—Military Studies*. Dr. Arnell will send the report to the Clerk, for distribution to the Members.

At 10.10 p.m., with the questioning continuing, the Committee adjourned to the call of the Chair.

Hugh R. Stewart,
Clerk of the Committee.

1. The first part of the report deals with the general situation of the country and the progress of the work during the year.

2. The second part contains a detailed account of the various projects and the results obtained.

3. The third part discusses the financial position and the resources available for the work.

4. The fourth part deals with the personnel and the organization of the work.

5. The fifth part contains a summary of the work and the conclusions reached.

6. The sixth part discusses the future prospects and the plans for the coming year.

7. The seventh part contains a list of the publications and the reports of the year.

8. The eighth part contains a list of the names of the persons who have contributed to the work.

9. The ninth part contains a list of the names of the persons who have been employed during the year.

10. The tenth part contains a list of the names of the persons who have been consulted during the year.

EVIDENCE

(Recorded by Electronic Apparatus)

Thursday, April 17, 1969.

The Chairman: Gentlemen, perhaps we could begin. This evening we will be examining the estimates of the Department of National Defence and we have in attendance as a witness, Dr. J. C. Arnell, the Assistant Deputy Minister of National Defence, who has particular interest in matters of finance and the estimates. Members will recall that Dr. Arnell appeared before this Committee with the Deputy Minister when we considered the 1968-69 revised main estimates of the Department last November.

For your information we are proceeding upon the basis of a reference which was passed by the House and which reads as follows:

Ordered that Votes 1, 10 and 15 relating to the Department of External Affairs; Votes 30, 35 and L35 relating to the Canadian International Development Agency; Vote 40 relating to the International Joint Commission; Votes 1, 5, 7, 10, 12, 15, 20, 25, 30, 35, 45, 48 and 50 relating to the Department of National Defence; and Vote 55 relating to Defence Construction (1951) Limited be referred to the Standing Committee on External Affairs and National Defence.

Tonight, as I have indicated, we propose to deal with the Defence Department's estimates. Next Tuesday evening we will be dealing with the estimates of the Department of External Affairs. You have the Blue Book in

• 2015

the usual form listing the votes and, in addition, you have the estimates in the new form prepared by the Department.

I propose, first, to call upon Dr. Arnell. I believe he has distributed a written statement with regard to the estimates and he has a few introductory remarks to make. Dr. Arnell.

Mr. Allmand: I do not know if this is the proper place, but would you inform us at

some time or other what our program will be now that we have returned from the Easter recess. I believe you had a meeting of your steering committee. I do not know what you have planned, but I wondered whether we would have a chance in the Committee to discuss the program from now until the summer recess?

The Chairman: Yes, we could do it now or we could do it when other members have come in. I thought possibly toward the end of our hearing this evening might be an appropriate time to do it when more members are present.

Mr. Allmand: Very good.

Dr. J. C. Arnell (Assistant Deputy Minister, Finance Division, Department of National Defence): Mr. Chairman, and members of the Standing Committee, as a result of my appearance last November when, in fact, you were looking at the 1968-69 estimates and you found the list of major equipment items and a few of the highlights of the estimates which we put forward at that time of use, I thought I would try to do the same thing this year except it had been suggested that rather than keep the hand-out until we appeared before the Committee that it might be helpful to you to have it sent around ahead of time. I believe all of you did receive the statement and the attached list of selected major equipment items which, I think, you will find are essentially the same list of items that we distributed last year and, in fact, are the major items of equipment that were put into the five-year program which was announced by Mr. Hellyer and Mr. Cadieux back in December 1964.

As I indicated in the circulated statement, this year's estimates reflect or relate to the fifth year of that five-year program and really it represents the rundown of that program as, in fact, many of the individual projects have either just been completed or are in the process of being completed.

As a result of the government's decision to embark on a defence policy review we were

directed to prepare a minimum budget for the fiscal year 1969-70 and, in fact, to plan on holding the line, as it were. You will, I think, have noted from the estimates, for example, that we have provided for 98,000 military man-years which, in fact, was the target figure for March 31, 1969 which, as I recall, we indicated to you last November. This represents a reduction in terms of military man-years of 2,000 from the 1968-69 budget. Similarly, the civilian man-years, you will find, are down some 2,400.

There are no new equipment projects as such, I think, for the reason I have already indicated, namely the government's decision to maintain a hold-the-line budget until the defence policy review was settled. As a result and as I have already indicated, you have essentially a clean-up type of thing on the equipment.

● 2020

As has already been indicated by the Chairman, the Blue Book contains the estimates in the vote structure which was the budget as formally presented to Parliament. I believe, when the new form of estimates was tabled it was pointed out that this was, in effect, for illustrative purposes and from our point of view they are not precise in the sense of the Blue Book. Our detailed supporting data in many areas is by the old objects of expenditure and as I indicated in the statement that was distributed to you we had to allocate some of the force components, in particular, on a rather broad pro rata allocation. I can explain to you how we did it, but there will be places as I think it is explained in the text where, because of two or three tasks that a single force was responsible for, we would put the estimated cost of that force entirely in one of the activities in the new form. I am quite happy to discuss the contents of the estimates in the new form, but as I have already indicated, there are certain areas where, if you want real detail, I will have to go back to the Blue Book formation, because this was the way, in fact, that the budget was compiled. If the Committee would like to start by looking at the new form, I am quite happy to do this and perhaps I can lead you through or do it any way you like.

The Chairman: Gentlemen, in order to get things under way, I will call Item 1 of the Blue Book which in this instance corresponds with Item 1 of the new form of estimates.

Department of National Defence

Administration

- 1 Departmental Administration, Operation and Maintenance including authority, notwithstanding section 30 of the Financial Administration Act, and subject to allotment by the Treasury Board, for total commitments of \$2,-695,674,125 for the purposes of Votes 1, 5, 7, 10, 12, 15, 20, 25, 30, 35 and 45 of this Department regardless of the year in which such commitments will come in course of payment (of which it is estimated that \$961,166,000 will come due for payment in future years) and authority to make recoverable advances under any of the said votes and, notwithstanding the Financial Administration Act, to spend revenue received during the year, subject to the direction of the Treasury Board, in respect of assistance rendered to the United Nations, the North Atlantic Treaty Organization or any member thereof, any member of the British Commonwealth or any provincial or municipal government and in respect of charges for supplies and services as authorized by Treasury Board and made pursuant to regulations under the National Defence Act—\$7,299,250

The Chairman: Are there any questions on this? Mr. MacLean?

● 2025

Mr. MacLean: Mr. Chairman, in an endeavour to clarify the situation even more for the Committee, and perhaps the witness will be patient if my questions seem very elementary with regard to Item 1, I would like Dr. Arnell, if he would, to help us correlate the information in the Blue Book and in the new form, together with the statement he has just given. Now with regard to Item 1, especially, to make sure that we understand the item, I think it appears in the same form in both, but this wording, I think, has been used in Item 1 for the last five years or so and there is a reference to Section 30 of the Financial Administration Act; notwithstanding this section and so on. I believe that is the section of the Financial Administration Act which deals with the entering into of contracts with regard to items in the estimates for that current year to the effect that a contract cannot be entered into unless there is supply to pay the payments which would fall due as

a result of that contract in that financial year. Then it goes on to mention the total commitments of over \$2 billion in each case.

I am afraid I do not understand entirely or I am not sure that I understand fully the meaning of this total commitment figure. I note that for the last five years it has been \$2.5 billion, \$2.6 billion, \$2.8 billion, \$2.7 billion and \$2.6 billion this year. There is another figure for commitment to be paid in future years and this is dropping. Now what does this commitment for future years cover in addition to large equipment procurement?

Dr. Arnell: Well part of the commitment for future years, is, in effect, really as you put it in your question. Whenever a contract is entered into that is going to have the cash payments spread over a number of years, it is necessary to have enough commitment authority voted by Parliament to allow us to really commit ourselves to that program. The reason for this larger amount of \$2.7 billion, of which only part is carried over in future years, is to provide a sort of bookkeeping authority in the sense of being able to meet salary payments and things where in effect money has to be committed ahead of the actual date on which it is paid. So, within this \$2.695 of total commitment the bulk, some 60 or 70 per cent, is to allow ordinary financial transactions to be carried on during the year. Then the future commitment, of which, as the estimates say this year, there is \$961 million, is really to allow us to enter into contracts that carry over. I could have one of the experts on the subject add to this, if you would like, to explain just exactly how the commitment authority is used.

Mr. MacLean: In this summary of selected major equipment items, there is a column which lists the balance to be paid in future years.

Dr. Arnell: That is right.

Mr. MacLean: Now I totalled that up roughly and I think it is only about \$200 million, but the total commitment shown in Item 1 is \$961 million.

Dr. Arnell: Well with your permission, could I ask General McCaig just to comment a little further on what I have said?

Mr. MacLean: Yes.

Dr. Arnell: Could you comment on this?

The Chairman: Could you please speak into the microphone.

Mr. Winch: Would he especially speak on the salaries. I thought salaries were in the normal budget and not in the future commitments.

Brig. Gen. A. McCaig (Director General, Budget and Finance, Canadian Forces Headquarters, Ottawa): As Dr. Arnell mentioned, when approval is granted for a particular program—for instance the CF-5 program totalling something like \$215 millions—it is necessary at that time to enter into contracts with the various contractual agencies for the total amount of that program. To do that we need this commitment authority for the full program, even though there may be only a few dollars spent in the first year and it is phased over a number of years. For example in the CF-5 program we would have asked, in the year it was first introduced, for some \$215 million of commitment authority. In that particular year we may have only asked for, shall we say, about 10 per cent in cash, that being what would come for payment in that year. In subsequent years then we would ask for the commitment authority for the unexpended balance of the program and the amount of cash that was coming due for payment in that particular year.

Mr. MacLean: This I understand, but the problem in my mind is the fact that I thought this continuing commitment would be chiefly for major equipment contracts. We have them listed here, or at least most of them; for example, the CF-5 in future years has \$18 million and so on, but when you add all of those balances to be paid in future years for all of these equipment contracts, they add up roughly to something of the order of \$200 million. Yet in Item 1 there is \$961 million committed. What does that \$700 million plus as a future commitment relate to other than equipment?

Brig. Gen. McCaig: A very large portion of it, of course, is commitment. These are only selected major items of equipment. There are other items as well within the total commitment package, both for equipment and construction and development. There are some O and M—operations and maintenance—types of contracts which are placed which cover more than a one-year period because of the nature of the buy and it is when you add the total of all of those items that you get the grand total. You cannot take it just from this list which is simply a list of selected major items.

• 2030

Mr. MacLean: Yes, I realize all of that, but I am surprised that even this partial list of major items makes up roughly only a quarter of the total future commitment. I would have thought this list would represent something like three-quarters of the total future commitment, perhaps, with the other items such as pay and so on that are on a yearly basis making up the rest.

Brig. Gen. McCaig: We certainly could provide additional information on this point if this is required. I do not have all of the items that make that up at my fingertips at the moment.

Mr. Winch: Would Mr. MacLean mind if I asked a supplementary in order to clarify this, Mr. Chairman? Under Item 1, Administration, you have listed close to \$1 billion for future commitments, but if I turn to the estimates for this year, for example, on page 27 of your White Paper there is \$74,411,000 for ships; there is \$1,930,000 for fighting vehicles and there is another \$2,878,000. Are these three amounts separate and apart from this \$1 billion or is this the total amount required this year? You understand, sir, what I am trying to get clear now?

Dr. Arnell: The total commitment authority for every use within the Department—the Defence Research Board on any major procurement upon which they may embark as well as the Defence services—is included in Item 1.

Mr. Winch: Well, then what does page 27 mean? Is that part of this?

Dr. Arnell: There is no commitment authority shown on page 27. There is a future year's requirement there which is—I suppose one would say, yes, this really...

Mr. Winch: Also the proposed estimate for 1969-70.

Dr. Arnell: Well, that is cash. That is the cash for...

Mr. Winch: Is that included in this?

Dr. Arnell: No, sir. The cash that is here is the cash that is included in the object of expenditure on Item 15 for the Construction and Acquisition of Machinery, Equipment and Furnishings. If you turn to page 242 in the Blue Book about two-thirds of the way-down the page where it says, "Construction and Acquisition of Land, Buildings and Equip-

ment", there are two items there; Construction and Acquisition of Buildings, Works and Land at \$19.6 million and below, it, Construction and Acquisition of Machinery, Equipment and Furnishings at \$210.4 million. Those are the totals of construction and capital for the military and you will find that the \$210 million figure will, in fact, be the same total that you will get as you go through all the individual items on pages 27, 28, 29, 30 and 31.

Mr. Winch: I am sorry, but I am talking about the ships, the fighting vehicles, the aircraft and the engines, not the acquisition of land or equipment.

Dr. Arnell: No, but these are the acquisitions. This is capital program. If you look at the heading at the top of page 27, it reads, "Detail of Major Construction and Acquisition Projects", this is, in fact, an information break-out of everything that is included in those two-line items on page 242 of the Blue Book.

Mr. Guay (St. Boniface): May I ask a supplementary, Mr. Chairman? What are the details of the particular construction and acquisition of various buildings as indicated on page 242? Could you give us the details as to what you intend for these amounts, \$19 million and \$210 million?

• 2035

Dr. Arnell: Yes, there is a very large list and it was in an attempt to indicate the major items that I had put together this other list which was in parallel with the list that we laid before the Committee last year. These are really the big items that are included in that \$210 million.

Mr. Guay (St. Boniface): Then could I ask, Mr. Chairman, as my supplementary question, if the gentleman could tell us in detail tonight, over and above the supplementary list that he has made available to us, what this item on the construction and acquisition of buildings consists of and, particularly, those which he thinks are on their priority list? Could he give us this specific information this evening?

Dr. Arnell: I could go through the entire list, but the sort of thing that is in here...

Mr. Guay (St. Boniface): Your priorities.

Dr. Arnell: In terms of priorities, the ones that are included are those that have a suffi-

ciently high priority to be in the current program. There are many others for which no cash is being asked and to give you an example of the sort of thing that is embodied in the \$19 million or \$20 million for construction, let us take a single base, Cold Lake, for which there is a \$305,000 item for sewage treatment facilities which are in need of repair. There are improvements to the ...

Mr. Guay (St. Boniface): Is there an amount on that sewage treatment?

Dr. Arnell: Yes, the amount is \$305,000. There is an improvement to the test range there where the CF-104 operational training is carried out in the amount of \$215,000. There is a ten-classroom school at \$600,000 and so on. There are several pages of these individual items, but this is getting away actually from the ...

Mr. MacLean: Mr. Chairman, on a point of order, I wonder if I might be allowed to return to my original line of questioning. I will soon be finished and then, perhaps, we can get down to the more widespread details. Again, referring to the wording of Item 1 which says:

...notwithstanding the Financial Administration Act, to spend revenue received during the year, subject to the direction of the Treasury Board, in respect of assistance rendered to...the North Atlantic Treaty Organization...

This means, I take it, that the total figure shown in the estimates is the net cost of defence and recoverable items are, in effect, over and above this. For example, if ... reimbursed during this year for assistance to the United Nations, say, to the extent of \$10 million for the sake of argument, that would be added to the total. Is my reasoning correct?

Dr. Arnell: If you look on page 242 starting at the top of the page under Administration, Operation and Maintenance, there are a number of things, Military Pay, Transportation and so on. Then there is a gap followed by a line item, "Less: Amounts recoverable". You will notice that the amounts recoverable are estimated to have gone up from \$94,962,000 in 1968-69 to \$99,158,000.

• 2040

Mr. MacLean: Oh, yes, for this year.

Dr. Arnell: Now, in effect, we are required to tell you how much we think we are going

to get in all the different ways that we are authorized to collect money and re-use it. The fact that you accept this figure say, of, \$99 million as moneys that we will recover, is the amount that we can recover and use from all these purposes. If, in fact, we recover more we cannot use it because, in effect, Parliament authorizes us to use \$99 million against the authority they have given us in the first place.

Mr. MacLean: Ordinarily though, under the Financial Administration Act this recoverable amount would go straight into general revenue and would have to be voted again?

Dr. Arnell: That is right.

Mr. MacLean: So you have this special privilege, if I might call it that, in Defence?

Dr. Arnell: I believe this does occur in other departments as well.

Mr. MacLean: Yes.

Dr. Arnell: The parliamentary control is, in effect, in the amount that we can explain how we arrived at the amount. Once that number is there, that is the number and the only way that number can be changed is by a supplementary.

Mr. MacLean: I do not want to take up any more time except to ask one further brief explanation of this list of major equipment items. Although there is no item here for a specific piece of equipment—I am thinking chiefly of refueling tankers for the CF-5 and perhaps some additional CF-5's themselves if it were determined that we should equip more than Mobile Command with them and possibly forward thinking towards the replacement of the Argus—is there any evaluation being done of possible suitable aircraft for upcoming replacements and that sort of thing on a tentative basis, if you wish, even though nothing appears in this for such a particular purpose.

Dr. Arnell: Yes, sir, in the Vice-Chief of Defence Staff Branch of Canadian Forces Headquarters there is a Deputy Chief of Force Development and within his organization there is a Director General of Force Objectives. It is the responsibility of this staff to anticipate the future and to investigate possible new systems, getting analysis done of operational research types and so on, and at all times having some knowledge of potential equipment systems or weapon systems for the future.

This is also one of the reasons why within this commitment authority there will in fact be at least some of it that is not immediately identifiable against anything in the estimates at all. It may well be during the year that a change in government policy or a change in something may in fact start a new program. Before a new program can be started you have got to have the commitment authority in order to even consider seeking Treasury Board approval to move ahead. This is sort of the one bit of flexibility to move ahead even though there is no cash available.

• 2045

As I mentioned in the statement, this really was one of the problems in the moving ahead on the major equipment program of 1964. There is a time lag where really all you can use is commitment authority. You cannot spend money because tenders have to be called or contracts have to be met and there is no money involved for perhaps six months and in some cases up to a year. So it is quite possible to start a new program even though there is no cash in the estimates.

Mr. MacLean: Yes, well I am pleased to know this. I would like to think—and I think I am right in assuming—that a great deal of thinking and planning is going into possible replacements for equipment that is on the verge of becoming obsolescent at the present time so that immediately a decision is made the tap can be turned on, as it were.

Dr. Arnell: Often the future studies will take three, four or five years before you get to a point where you can really spend money.

Mr. MacLean: I would like to pass at this time.

Mr. Nowlan: Could I ask a supplementary to that statement?

The Chairman: Mr. Nowlan on a supplementary.

Mr. Nowlan: Will there be someone from the Department to discuss some of those long-term plans and/or replacement of present equipment and/or, in particular, this sum of money that Mr. MacLean was talking about and the leeway that Dr. Arnell says is there. I am thinking precisely of the Argus and/or the Orion. I do not want to ask any further questions on that if somebody later is going to be talking further and in more detail of some of the departmental thinking on replacement of equipment, not necessarily

with the authority that you are going to go ahead and get it depending on what the Minister decides and what the policy review decides and/or what the state of maritime transport is.

Dr. Arnell: Well this is really what I would have to answer at this time, that the direction in which the new policy is going to take us becomes a bit academic as to what is being thought about is many areas. However, I can assure you that for example the question of whether the Orion would fit in as a replacement for the Argus has been under consideration for several years. While they were looking at the Orion they were also looking at the Nimrod which is the new British maritime control aircraft which is based on the Comet. This is the thing every time they are looking at competing systems, competitive systems.

Mr. Nowlan: Well I appreciate that, and I know they have been looking at different systems but my question, arising from Mr. MacLean's question, is based directly on your statement about the time lag that necessarily evolves between a decision and procurement and/or some detailed discussion here from this department within headquarters as to what the status is. As far as some of my information is concerned we are almost beyond the point of mid-life of the Argus and even if a decision was made tomorrow it might be very doubtful if there was going to be any plane to replace it by the time you train pilots, have the conversion program and so on.

Dr. Arnell: My recollection is that the Argus is good until at least 1975. I believe that perhaps with some structural reinforcement and so on, it can run until 1978.

Mr. Winch: May I ask a brief supplementary? How do you do your forward thinking on equipment? You mentioned the Argus, but I want to mention the Centurion tank which we are told is about two years. How do you do your forward thinking without knowing what the defence policy is going to be?

Dr. Arnell: I think the only way I can answer that Mr. Winch is to say that five years ago the government approved a five-year equipment program.

Mr. Winch: The five years is up this year, is it not?

Dr. Arnell: This is the end of the time. As you are aware this re-examination of defence

policy has in fact been under way for at least a year in one form or another. Within the department, I would say the question of where we should be going has been under consideration in, perhaps, a partially academic sense all the way along. If I might go back to eight or ten years ago when I was Scientific Advisor to the Chief of the Air Staff and very much involved in the future look, within the air force every time a new aircraft system was put into the program and procurement started, because of the long lead time, the beginnings of systems analysis would be started of what sort of things were on the horizon for the next generation around and, of course, this was during a period when the speed of aircraft was going up 100 miles an hour a year. You know, what you were ordering then was going to be pretty slow by the time you got delivery of it. There was one period about 10 years ago when one wondered if the generation of aircraft—in the high performance type—would really last more than about five years. The system carriers, such as the Argus and the things in which the speed was not the critical factor, had a long life, but for a fighter aircraft type of thing, you began to think what you were going to replace it with before you got the one. This was just a continuous process. There was one group of people who were conscious of this fact and who were trying to guess what would be coming next.

• 2050

Going back to that period, this was the time when you really could not tell what was likely to happen and at that time we did one study in the air force that, in fact, examined the probable aircraft needs for every kind of conflict that anybody could imagine from a World War II type of exercise in the desert with absolutely no ground support or anything else where an airplane was just on its own to the type of sophisticated environment that was being envisaged as the most elaborate of the systems. We had a whole series of studies so that when somebody asked for something we could, at least, give them a line on where they were likely to go.

Mr. Winch: What you are saying now is that no matter what comes down from the government as defence policy, because of your forward looking you have in mind what you are required to meet?

Dr. Arnell: There will be some ideas, but once you know which way the government

wants to go in defence, then you obviously have to pause and go into detailed studies before you can come forward and explain, say, to this Committee that this is the type of equipment that will meet that particular thing. All we can tell you the first time around is that this is the sort of thing you might do, but we cannot tell you what it will cost and so on until we get...

Mr. Forrestall: May I ask a supplementary?

The Chairman: I wonder if we could pick up the supplementaries in order, Mr. Forrestall? Have you finished your questioning, Mr. Guay?

Mr. Guay (St. Boniface): I was not satisfied with the answer, but I will let the discussion go on for the time being, Mr. Chairman.

The Chairman: I think Mr. Allmand had a question, followed by Mr. Nowlan and then Mr. Forrestall.

Mr. Forrestall: Mine is a supplementary and as long as the others are supplementary, I will wait my turn.

The Chairman: That is fine. Mr. Allmand?

Mr. Allmand: Mr. Chairman, my question is a supplementary. In the list that was distributed to us before the meeting entitled "Selected Major Equipment Items—1969-70 Estimates", the amount that has been spent for each item is shown plus the amount outstanding. I wonder, Dr. Arnell, if there is a list showing how many of these items have been received and how many you expect to receive with the dates?

Mr. Forrestall: Mr. Chairman, on a point of order. My question is directly supplementary...

The Chairman: Excuse me for one second. Is this on Item 1 or is it on Item 15, Mr. Allmand?

Mr. Allmand: I think it is on Item 1, but I may be wrong.

Mr. Forrestall: My question, Mr. Chairman, is supplementary to questions that have been asked and it is in public pursuit of a position that has been enunciated in the last couple of days about a question that is under discussion right now.

The Chairman: I think your question, perhaps, relates more specifically to Item 15, Mr. Allmand, and with your permission we could

take the question raised by Mr. Forrestall, which I gather relates directly to the inquiry which we are now pursuing.

Mr. Forrestall: My question relates, but again, Mr. Chairman, I must open myself to the position of contradiction in this sense. Dr. Arnell, in the last issue of the publication *Sentinel* which has just come to the attention of the members of Parliament in the last day or two, the Orion program has been referred to as the best bet as a follow-on aircraft for the Argus and I agree with that technically. My supplementary question is, do you agree with this or have you had any reason in your capacity to believe that the government has decided, in fact, to follow on with the Argus?

Dr. Arnell: No, as far as I know, this is part of what is to be looked at.

Mr. Forrestall: You have had absolutely no direct indication...

Dr. Arnell: No.

Mr. Forrestall: .. and the *Sentinel* is wrong and is misleading...

Dr. Arnell: I am afraid I have not seen the *Sentinel*, but I would say it is definitely incorrect to imply that there has been any action taken. People may have looked at it and said, "If we go ahead, this is where we go." However, nothing has come forward officially on that.

Mr. Forrestall: Some of us took false hope then from the article in the *Sentinel*. Thank you.

The Chairman: Mr. Nowlan, do you have a question on Item 1?

Mr. Nowlan: Yes, but I thought Mr. Allmand had a question.

Mr. Allmand: Mine is on Item 15, it seems.

Mr. Nowlan: I already have asked part of my question. Basically it was with direct reference to the Argus, but more generally it deals with what Dr. Arnell said about the different studies for equipment systems and the forward look. It really comes right down to what the Minister of the day decides the policy is going to be, does it not? Or to put the question precisely as past history, whatever happened to all the studies and reports on the CF-5? Did they ever get to the Minister's desk or did they ever get to a Parliamentary desk? Certainly I appreciate this is perhaps controversial and I am not asking to be

controversial. I am trying to explore how to avoid some of these problems in the future. If this task force or this Department of headquarters and the men who are making these studies decide as a result of the studies that a certain piece of equipment is negative and the Minister with his discretion says that it is going to be positive, how can a Parliamentary committee explore this if we do not have some of these reports?

I appreciate you are not the one to make the decision, but in order for a Parliamentary committee to cross-examine the Minister on why he is going to go ahead on a piece of equipment—in the case of the CF-5 I would suggest, the majority, if not all, of the inter-departmental reports were negative for a multitude of reasons and on which we are still trying to work out the kinks—we need these reports. I am not trying to ask you to re-hash necessarily the CF-5, but how is a Parliamentary Committee—I listen to you and I like to agree with you, but we are the elected people and the Minister does have the responsibility to decide—going to perform its duties—we are starting to specialize in committees—if it cannot in some way get at some of these reports in order to cross-examine the Minister and to carry some of the load and the frustrations that you carry when you see your equipment shot down?

Dr. Arnell: I would agree with you and I think that what is going to be one of the real advances in Parliamentary understanding of things is, in fact, the conversion from what has been a one-year control budget-type philosophy that has been prevalent for years and years and years all over the world in the old Blue Book sense with standard objects of expenditure which, when they came in, I understand, were quite an advance over what had been in existence prior to that in terms of people understanding what the money was being voted for, to this new idea of being able to talk ahead five years in programs. People can become interested in knowing what the program is rather than just saying, "Why do you have \$50,000 for postage". I think it is a mutual educational process and it is moving in this direction. I think the studies that are being done right now because of the Prime Minister's recent statement on defence policy are going to lead to what one might call a new direction for the program. When this is decided, this will be the time when I think this Committee can call for an explanation from the Minister, or he can direct offi-

cials to describe the conclusions that came out of this, and this is the time to probe and see how the things were arrived at.

• 2100

I would suggest that one of the reasons it has never been done is there has never been the opportunity to do it, there has never been the interest to do it and the material has not been available to do it.

To my mind, we are living in a new era. This is one of the reasons why last November, when I first appeared before you, I talked about our management philosophy, and about how some of these things are arrived at. I do not believe anybody had ever come forward before and talked about the process by which these things are arrived at, and the questions tonight indicate an interest in this which three, four or five years ago probably would not have existed.

I think you will find as this system develops you are going to be almost forced to look into it, rather than its being the other way around.

Mr. Nowlan: Just one short comment, Mr. Chairman. I certainly agree with the philosophy expressed by Dr. Arnell, and would like to believe it is going to bear fruit. Being on the political side, I am a little cynical. For instance, as you explained to Mr. MacLean, you can think ahead and project ahead without its ever appearing. I can understand if it gets within the framework now, and there is a change within the five-year planning, obviously it sticks out like a sore thumb and members can ask questions.

However, in the precise example of, say, a replacement for an Argus, first you have to have a decision as to whether or not there is going to be any Maritime command, and I appreciate these are policy decisions. But assuming there is going to be a Maritime command and a plane to replace the Argus, how is this Committee, even under the philosophy that you describe since this has not appeared before under a five-year plan, going to know whether it is the Orion or some of these other planes that you mentioned which will replace it, where in fact all these task forces within the Department may have said no to the plane the Minister picks, and we will not know.

Dr. Arnell: This Committee in the last three or four months has devoted an awful lot of time to probing into areas that I do not believe it has ever really looked into before.

Mr. Guay (St. Boniface): Hear, hear! Wait until we start on the budget.

Dr. Arnell: When you get to the question of a change in the direction of defence policy, if the pattern of Committee members' thinking is to be continued, you are going to be interested in things in which, I would suggest, committees in the past were not interested.

On the question of all the documents and everything, undoubtedly a Minister is going to decide he wants to retain some of it but he is still going to have to explain in general terms what his confidential papers contain to satisfy you in terms of getting a . .

• 2105

Mr. Nowlan: Mr. Chairman, my last question is more precise and I think the doctor has answered it in a general way.

It is your opinion and judgment then, that with the studies that have already been carried out, and admitting the lead time necessary for a change to a new piece of equipment, that we have not gone beyond the point of no return as far as the Argus is concerned?

Dr. Arnell: This was one of the fundamental points that allowed the Department to really accept the hold-the-line budget for the year that the major equipment, when examined, did have enough life in them, that none of them, in fact, had to have a new program this year or suffer any irreparable damage.

Mr. Nowlan: Could you tell me, doctor, what is the critical time for a decision to be made on . .

Dr. Arnell: The bulk of these major equipments, the Argus is one—as I say, it was 1975 to 1978. I would say with another, 1970 or 1971 would probably be the year for the beginning of the new program.

Mr. Nowlan: How long did it take to change from the Neptune to the Argus?

Dr. Arnell: They were in parallel, of course. The two of them were bought almost at the same time—I forget the actual dates—and they were, in effect, flying together.

Mr. Nowlan: Thank you.

The Chairman: Mr. Forrestall?

Mr. Forrestall: Doctor, just to follow along the questioning of Mr. Nowlan it would be appropriate to ask whether or not the old

concept of five or six years lead time is now something of the past and that because of what is on the shelf we are able to accomplish in two or three years what perhaps earlier took five or six years. Is that a fair estimate?

Dr. Arnell: This is a debatable point that really hinges on at what stage you pick up something along the way. The lead time of many of the sophisticated equipments, if you start from the research and development stage, is just as long a lead time now as it might have been ten years ago. On the other hand, and perhaps your questions about the Orion are a case in point, there is an airplane that, in effect, you buy into a production line, and if you buy into an on-going production line you obviously have a shorter lead time than if there is a decision to support a Canadian industry and tool up in Canada to produce something that may be produced somewhere else. This is not a departmental decision. This may be a government policy to aid Canadian industry.

Mr. Forrestall: That is right, but of course, it is one that is influenced by departmental thinking because you are the professionals.

Doctor, that had nothing to do with the question I wanted to ask under the particular item. I wanted to go back to the DDH program.

The Chairman: Mr. Forrestall, I am advised by Dr. Arnell that we are now getting into a matter which could better be discussed under Vote 15, and I believe Mr. Allmand has some questions there as well. Could we pass on?

Are there any other questions on Item 1? Mr. Guay?

Mr. Guay (St. Boniface): I could ask a question if you will allow me, doctor. It is with regard to municipal governments. I will use Item 12 as an example, where it says "for details, see page 241". I certainly do not consider the item to be detailed in any way, shape or form on page 241. However, I must go back to Item 1 because this is the point of discussion. What is the participation of municipal governments in this regard? I have a little experience with municipal government and I do not recall, for instance, "Operation and maintenance including authority", and also with regard to Item 1 you specify provincial and municipal governments. What are they? I would like to be enlightened on that.

• 2110

Dr. Arnell: Perhaps we can turn up one for you, but the purpose of the wording here is that essentially this item, as was raised earlier, is what allows us to spend revenue that is received for rendering assistance at really any level of government. The most common one in Canada, where there is in fact revenue received by the Department, is where a provincial government asks us to undertake a specific thing which, it has been agreed earlier, is the kind of service that the Department of National Defence provides on a recoverable basis. One that comes to mind was where cattle were isolated in a blizzard out in Alberta several years ago and the provincial government asked us if we would assist in the feeding of these cattle. When they asked us if we would assist they stated that they would pay us for our services, but when the whole operation was over we rendered in effect the straight out-of-pocket expense cost. I cannot think of one at the moment on a municipal basis but it could conceivably happen where a large city asks us to do something.

Mr. Guay (St. Boniface): I appreciate your answer. However, I feel that the statement is relatively broad and that this applies only in unique circumstances. I presume that you must make a certain allowance under this particular part of your budget in case of certain things happening. This particular item may certainly represent a substantial amount of money but yet it is really never spent for that particular purpose.

Dr. Arnell: We do not budget specifically for these. I now can give you an example of our undertaking something for a municipality. I think in connection with the Pan-American Games in Winnipeg we actually did undertake something with the city which was on a straight recoverable basis. If we cannot do it within our normal operations, as it were, we just say we are sorry. It is not something that we actually budget specifically to be able to do. If there is a forest fire and we are asked to help, or if there are problems like the ones in Saskatchewan now with the floods, any local forces that are available there can give up their local training and go and help. This is what always happens. As has been the case a number of times in the past with forest fires, if there is not a major search on you invariably use your search and rescue helicopters. However, if a search has to be undertaken the forest fire may suffer a little

in support. This really is our only authority parliament gives us to recover our out-of-pocket expenses. In fact, we do in our recoveries include a bit of money which is really based on historical figures because you cannot really predict with any precision what you are going to do next year to help people. So there is a bit of historical fact in our recoveries, and of course if we do not get the money that we have estimated we are going to get we are just as short as if we did not get it in our budget to start with.

Mr. Guay (St. Boniface): Thank you, Mr. Chairman. Thank you, Doctor.

Mr. Cafik: May I ask a supplementary on this giving of money to municipalities. I understand from what we have been told in the Public Accounts Committee that a lot of this money that is being given the provinces is not really recovered by the federal government. Is this correct?

Mr. Lewis: They do not get money. You are not talking about money, are you?

Mr. Cafik: No. But we supply services for which a charge is made to the province and in many cases this money is not paid. I believe it has not been written off but many have suggested that we may as well write it off because we will not get it. I understand that Newfoundland is one that owes the federal government a reasonable amount of money for this purpose and has refused to pay it. Is that correct?

Mr. Nowlan: British Columbia too.

Mr. Cafik: Yes, that is correct.

An hon. Member: They can pay it. Newfoundland cannot.

The Chairman: Have you any comments on that, Dr. Arnell?

Mr. Cafik: I would really like to know if the Department has any plans to recover this, or is it just going to leave it sit?

Dr. Arnell: This is reviewed periodically within the Department. We take follow-up action directly in many cases. Of course, it is like anybody else who has money owed to them; if in effect somebody says, "Will you do something for us and we will pay you" and you do it in good faith and then you send them a bill and they ignore your bill, you follow it up a number of times and you really have not any defence when somebody says,

"Why did you not get the money?" We have on occasion sought authority to write off bad debts of this type. I could in fact give you more information on this, if you were interested, although I think it has probably been dealt with and I am sure the information will be provided through the Public Accounts Committee.

Mr. Cafik: It would seem to me that there is a very simple way of recovering through perhaps the Treasury Board. A lot of money flows from the federal government to the provinces and an offsetting procedure could be used. It is not as if it was a one-way street.

• 2115

Mr. MacLean: Mr. Chairman, I have one quick supplementary.

In a case where a program falls behind schedule, through no fault of the department—perhaps procurement or something of this sort—and you are not able to spend the amount of money that has been approved in the Estimates of the current year for that project, does the item lapse or do you have a special right to carry it over to the next year?

Dr. Arnell: The actual cash provided lapses. The only money in the entire Estimates that does not lapse is Vote 48.

Mr. MacLean: Thank you.

Mr. Guay (St. Boniface): Would it not be possible, Doctor, that in future it would be shown where help was requested. I am thinking of, say, the Pan-American Games in Winnipeg and the amount of help you have given them—whether it be cattle in Alberta or something in Charlottetown or Vancouver—so that we would have detailed account of what was spent the previous year. When I speak of details of, say, the help we have given section 241 because there are no details there. In fact, that is very confusing, particularly to the new members. I am thinking in terms of details of, say, the help we have given Manitoba, Winnipeg, St. Boniface or St. James, then the details on the Pan-American Games or the cattle situation in Alberta. This would be a more sensible way of presenting a budget, particularly to newcomers. In this way we could make a sound assessment on what you spent last year and what might be needed this year. If I presented this type of a budget at the municipal level I would be thrown out in no time flat—I am sure you

would also be in the same boat—because we would not buy these broad terms.

So would it not be possible to show the details? And when I say "details" I do not want someone telling me to look at page 241—because there are no details there. The details should show those you have helped, and only in this way can we make an appropriate assessment.

Now if by chance I am shooting my mouth off here and I should have looked in certain books or certain reports which I have not available to me then I would suggest, Mr. Chairman and Doctor, that these be made available, particularly to the newcomers who are not aware of them, so they will be in a better position to make the appropriate assessment I mentioned.

• 2120

Dr. Arnell: I think perhaps there is a slight misunderstanding here. In looking at the blue book, with all the description under Vote 1, the dollars that are shown beside it, the \$7.316 million does not include any money that is directed at aiding any provincial or municipal or any other kind of activity. That money, the \$7.316 million, is almost entirely to provide—or at least \$6.482 million of it is, as you will see in the new form of Estimates, 1969-70, for National Defence on page 8—to provide for the salaries of the Deputy Minister's staff. The remainder of the money is to pay for the information services. But it is almost entirely a salary Vote, because this is in fact is where the Deputy Minister's staff, who are responsible for what is now called Civilian Control and Policy Management, draw their funds. This is where the money is provided for that staff.

All the rest of the text in here is really to provide the necessary commitment authority to allow contracts to be made which are going to have a requirement for cash later, so that people can let a contract even for three months from now without having to put cash on the line, and also to provide authority for us to bill the various people listed here, United Nations, NATO, any members of the Commonwealth, provincial, or anything, for any services that we give out of our normal operational forces or out of our normal stocks of stuff. I do not know for sure at the moment—I could find out if you are interested—whether in fact we bill, and I presume we do, for the sandbags that we have provided for

floods, and so on. These are in our stocks, and we cannot replace our stocks if we ship out 100,000 sandbags unless we collect money to buy some more. This is really the kind of thing, and this is merely giving us authority to bill somebody for something of ours they may have used. There is no actual money in Vote 1 that goes for that.

The Chairman: If there are no further questions on Vote 1, in accordance with the suggestion made by the steering committee, if you agree, we will stand Vote 1 in case other questions do occur to members which might possibly require the attendance of the Minister or other witnesses. And we will proceed then to Vote 5.

Before calling Vote 5, would the Committee agree to print the advance statement submitted by Dr. Arnell, including the attached selected major equipment items, as an Appendix to this day's Minutes of Proceedings and Evidence? Is that agreed?

Some hon. Members: Agreed.

The Chairman: Perhaps I might also take this opportunity to answer the question raised by Mr. Allmand as to the agenda of the Committee for the rest of the month and for the next few weeks after that. We had a meeting of the steering committee, and it was decided that we should try to complete all the estimates which were referred to the Committee by the end of this month if we could, and then proceed at the beginning of May with our general review of defence policy.

Mr. Forrestall: Would that include Maritime Command?

The Chairman: That was one of the items which was suggested. Dealing specifically with next week, on Tuesday evening at 8:00 p.m. we hope to deal with the estimates of the Department of External Affairs. We have no other meeting scheduled for next week, but we could possibly arrange one if we do not proceed as rapidly as we anticipate. We may need it to finish up the estimates of the Department of National Defence if we do not finish them off this evening. Then on Tuesday, April 29, we have two meetings scheduled, one at 11:00 a.m. and one at 3:30 p.m., to deal with the estimates of the Canadian International Development Agency. So we would hope to finish all our estimates by the end of the month if we could, and then proceed with our general defence review.

• 2125

As members know, when we filed our interim report with the House before the Easter recess, we reserved a number of items in that report, and I might just remind you of them. First we reserved on NORAD, and that presumably would include consideration of ABMS and possibly AWACS. We reserved the question of the Maritime Command, future roles in NATO, peacekeeping, civil defence, and disarmament. The steering committee discussed these various items and thought that possibly the most urgent were NORAD and the Maritime Command.

We also discussed in the steering committee the possibility of setting up sub-committees to deal with these various items. There are some practical difficulties due to lack of facilities, and we will have to give that suggestion some further thought, whether or not we could save time by the setting up of sub-committees on these various items, and how they would function. But in the meantime we do have those two major items which seem to be of prime importance, namely NORAD and Maritime Command. If any of you have a preference as to which item should be dealt with first, we can either discuss it now or you could perhaps notify your party representative so that a decision could be made as to which one should be proceeded with first. Mr. Forrestall.

Mr. Forrestall: Mr. Chairman, because of the very obvious urgency of the review that we have yet to complete, of its importance in terms of what the government now must do, particularly in light of the indications given by our Prime Minister of the necessity for this, I would like very much, whether or not it becomes a matter of discussion right now, to at least suggest to the Committee that before we look at anything else we must look at what would be a primary specialized role. And in that sense I would ask you and the steering committee to consider Maritime Command in some priority over NORAD.

The Chairman: Mr. Allmand.

Mr. Allmand: Mr. Chairman, first of all, do I understand that if we deal with NORAD we will deal with the problem of the ABMs?

The Chairman: That would be logical, if we can get sufficient information at this stage on that subject.

Mr. Allmand: In that case, I would urge—maybe we will have to have another meeting to decide this. Maybe we will have to see our party representatives, but I think that we should as quickly as possible try and get some information about the ABMs. The Government is supposed to be studying it from their point of view, and obviously the American government has to make some decisions. Their committee is working on it. I feel that Maritime Command could wait two or three weeks while we try to get as much information as we can on the ABMs. I realize we have to have the estimates done, but as soon as possible after that I feel we should have some kind of meeting to make some kind of recommendations with respect to ABMs and NORAD.

The Chairman: Probably there is no possibility of deciding definitely this evening when we have the Defence estimates to proceed with. But would members give some thought to this question? I gather that we all agree that these are the two major items, at any rate, that we should proceed with first. The only question is which one we take up first and which one comes second. Mr. Cafik.

Mr. Cafik: It seems to me that the over-all problem we face is that the government is going to be making decisions in terms of its reduced forces in NATO, and of course on this ABM system.

With these things in mind, I think that it is very important that we proceed as much as possible on all these levels so that we can come down with recommendations prior to the making of those decisions, which will be made certainly by August anyway, and probably prior to that time.

The Chairman: Mr. Nowlan.

Mr. Nowlan: What Mr. Cafik raised in a general way is just what I wanted to raise. We all ran into the problem with NATO, to which Mr. Lewis referred, of three months of hearings, a tour of Europe, and then we had to hurry up and get out a report. And there is still a question in many of our minds whether decisions were made before the report.

• 2130

Mr. Chairman, my question was, have you any idea, either from the House Leader or from the Prime Minister or from Mr. Cadieux, and whether you read the Press or

listen to the House—there may be some difference of opinion between Mr. Cadieux and The Prime Minister as to the time limits. You say the estimates first. My first question is, why, if we are going to study ABM, Maritime Command and all these for the very point that Mr. Cafik mentioned? One of the ministers, I think, says that our allies are going to be told in May or in August and then someone else says December, but in any event we are not going to be here in the summer. My first question is why do the Estimates have to come first and separate aside from some of these general policy discussions, when perhaps we should be breaking into subcommittees so that we can formulate a report if the report is to be worth the paper it is written on?

The Chairman: To answer your question specifically, Mr. Nowlan, I have had no information concerning any time limits imposed upon any specific reports the Committee might wish to file with the House. I think the answer to your second question about why we are proceeding with the Estimates is simply that we feel we probably can dispose of them within a reasonably short period of time, whereas it is very difficult to anticipate how long an inquiry on these other two major items that I have mentioned would take.

Mr. Nowlan: Before it was NATO and as I remember it you did make an approach to, or discuss it with, the Prime Minister and as a result of that and perhaps a couple of other things there was no stated policy on NATO before they had our report. Has the steering committee considered whether the same procedure might be followed so that all this motion and effort is not perhaps superfluous and redundant?

The Chairman: We can give that some consideration, Mr. Nowlan. The steering committee has not considered that particular question yet.

Mr. Nowlan: Certainly the Prime Minister's statement involved the Maritime Command potentially. He has already mentioned it as an area of study, and it involves NORAD. I would not want to see us go through the charade of meetings and hearings, and perhaps investigating on the site some of these other problems and find out that the report comes after the decision.

The Chairman: I think that is a good point, Mr. Nowlan, and we will bear that in mind.

Perhaps you would indicate to your party representatives any ideas you may have with regard to the relative priority of these two major items and also any suggestions you have with regard to methods of breaking up into subcommittees if you think this is feasible, bearing in mind the facilities available. Perhaps now I could call Vote 5 on page 239.

5 Grants as detailed in the Estimates—
\$546,375

Mr. Cafik: On Vote 5 I have just a couple of short questions. We have a fair amount of money, although rather modest compared with the other items in the Estimates, for rifle associations, military service associations and so on. Can you explain what these grants are really for? I think I am talking about the right vote.

The Chairman: Yes, that is right.

Mr. Cafik: I do not know anything about these details. I am particularly interested in the United Services Institutes. What is this money used for?

Dr. Arnell: In the case of the United Services Institutes, because it is only in the order of a couple of hundred dollars, I suggest that essentially it is really just a small amount of administrative money for postage and probably for sending out notices.

Mr. Cafik: No, I think we do not understand each other. For instance, under Military, United Services Institutes and Others as shown on page 13 of the new form of estimates, there is \$50,000 for the Air Cadet League of Canada. What do they do with that?

Dr. Arnell: This is the money . . .

Mr. Laniel: Is that not really under Item 1?

Mr. Cafik: No; I believe it is Item 5 in the old form. It is Vote 1 in the new form.

Mr. Laniel: Yes, but it is Vote 5 in the old one.

• 2135

Dr. Arnell: With respect to the Air Cadet League of Canada—in fact, the three leagues—these are largely voluntary organizations that run the cadet corps all across the country. For some years the Air Cadet League of Canada, which is a very active league and runs the air cadets all across the

country, has been helped. This goes back to the days of the air force itself. They helped the Air Cadet League to the extent of \$50,000. I do not think I can dig out the figures now of what we estimate it actually costs to run the cadet movement in Canada, but it is a very sizeable sum, as I recall, compared to the \$50,000 that the Department gives.

The Navy League of Canada, which is the sea cadets, operated as a purely voluntary organization that collected all its own money for the sea cadets until it finally reached the point where it just simply could not keep the sea cadets going on a purely voluntary basis and sought help from the Department.

The reason the air force was always so interested in supporting the air cadets is that there was, in fact, a record of many air cadets going on to join the service. Those that did proved to be very good airmen and it has always been felt that for the very small amount of money that goes into the cadet movement across the country, this is really money that has been well invested for what we get in the way of boys who join up as a result of it, and so on.

This is one reason why you will notice that no item is shown for the Navy League of Canada for 1968-69. The Navy League of Canada has, as I say, finally found that it just could not keep operating on its own and it was the Departmental view that like the air cadets it is really too good a movement to see waste away.

Mr. Cafik: What about the Canadian Universities—Military Studies? What is involved in the program there at the university level?

Mr. Laniel: Is that Sir George Williams University?

Mr. Cafik: Is this to teach them how to wreck a computer in 10 minutes, type of thing?

Dr. Arnell: No, this is really the five Chairs of military studies that have been endowed, if you like, at five of the universities.

Mr. Cafik: Is this for post graduate work?

Dr. Arnell: It is essentially for post graduate work. One of the Chairs is here at Carleton University which is included in the School of International Affairs. Alistair Buchan was the first incumbent of the Chair. They plan to keep it as a way of bringing in senior people. This, in fact, replaced the university reserve training programs—the Can-

adian Officer Training Corps of the Army, the university reserve training of the air force and the UNTD of the navy.

It was felt that in the long haul probably more value in getting an understanding of military history strategy, military studies, would be a result of establishing these Chairs at senior graduate and post graduate levels than the other system. It is estimated at \$50,000 a Chair. Authority was given for six but at the moment only five have been established. Those are the two new items that are in the old list.

You will notice a \$300,000 change from last year to this year. Fifty thousand dollars is for the Navy League of Canada and \$250,000 for the Canadian Universities—Military Studies.

Mr. Cafik: These Chairs were just established last year?

Dr. Arnell: Yes.

Mr. Cafik: Thank you very much, Dr. Arnell.

Mr. Allmand: I have a supplementary question on that point.

The Chairman: Mr. Allmand?

Mr. Allmand: At what universities are these Chairs?

Dr. Arnell: As I recall, subject to correction, I believe they are at Acadia University in Nova Scotia; Université Laval; McGill University, I believe; Carleton University and University of Victoria in Victoria, British Columbia.

• 2140

Mr. Allmand: Are these specifically Chairs for military studies or are they all approximately the same as the one you described at Carleton University?

Dr. Arnell: They are called military studies, but really in the broad sense they are everything from strategy to military history. The individual institutes have, I would suggest, some freedom of action as to just who they fit in there because having Alistair Buchan come to Carleton for three months was really quite a stimulus in the broadest sense of strategic thinking.

The actual decisions on how or where this money is placed were worked out with the Association of Universities and Colleges of Canada, so it was really the universities

themselves that decided how this program would be developed.

Mr. Allmand: Are these courses that are provided through these chairs open to the general student bodies at those universities?

Dr. Arnell: Yes, in fact, in the case of Carleton University when Alistair Buchan was here, they made one of his courses available to part-time students on the payment of the fee.

Mr. Allmand: Thank you.

The Chairman: Mr. Stewart and then Mr. Forrestall. Mr. Stewart?

Mr. Stewart (Cochrane): I just have a supplementary to this as my other question was asked. I wonder what led to the establishment of this \$250,000 for these five chairs. I wonder what the need is behind it since we have staff colleges and so on. I wonder why we are doing this in universities and having an additional grant going out from the government?

Dr. Arnell: I think the staff college and the chair in the university are really two quite different things. This is to broaden the type of teaching or research—whatever you like to call it—in universities in what has been developing in some of the schools that have been seeking to develop institutes of international affairs. I think, as one might say, the Department has been very conscious in recent years of the fact that there was really nobody in any of the universities who was thinking in terms of the strategic side of the picture in international affairs. Most international studies tended to be economic studies or trade or something else. There was nothing with the military flavour. This was introduced to provide a little incentive to broaden the scope of the schools. As I said, it really is, I think, quite flexible as to just how...

The Chairman: Mr. Forrestall?

Mr. Forrestall: Dr. Arnell, you may be able to answer this very briefly. In terms of the government reaching into the private or non-military sector for one reason or another, whatever it may be, might I ask you if to your knowledge, the Boy Scouts of Canada, for example, either in its national contacts or in any of its regional or provincial contracts have ever approached the federal authorities for the type of grant of financial assistance in a much more definitive way that is made

available to the Royal Canadian Sea Cadets, the Royal Canadian Air Cadets and The Royal Canadian Army Cadets for such programs as rifle practice?

Dr. Arnell: Not to my knowledge, but I can only speak from the point of view of National Defence. Whether they have approached another part of the federal government, I could not answer.

• 2145

Mr. Forrestall: Would it be a matter of policy or could I ask you what the reaction of your Department would be if the Boy Scouts of Canada were to approach you in terms of utilization, for example, if rifle ranges that are available in communities right across Canada and in terms of the supply to them of ammunition, not rifles, but just ammunition?

Dr. Arnell: I think I would have to say my answer is a purely personal one because with respect to your specific question of rifle training and so on, probably my first reaction would be why do they not join the cadets and get a little of the military side. I have just been told that within the broader business of help, that along with many other organizations, upon occasion, the Boy Scouts have been helped in the local sense by perhaps setting up a camp or something where there is a local military unit or a local reserve unit, but it only would be help in the sense of having something available. There has never been, to my knowledge, any question of providing them with money.

The Chairman: Mr. Guay and then Mr. Lewis. Mr. Guay?

Mr. Guay (St. Boniface): Could I just ask—

The Chairman: I think perhaps we had better hold that supplementary. I will put your name down, Mr. Allmand. Mr. Guay is next and then Mr. Lewis.

Mr. Forrestall: If I could refer back to one question, Mr. Chairman I would like to ask just one clarifying question. Could I ask the Doctor whether or not the attitude of the Department is one of charity because from what I can gather and from what he has said there has been a lot of local goodwill towards the Boy Scouts Association.

Dr. Arnell: I would not say there has been a lot.

Mr. Forrestall: Or some.

Dr. Arnell: All I tried to imply was that many people have been helped. To keep the

records perfectly straight, there have been many exhibitions that have been lent a tent type of thing just to keep flowers in. In this way we have helped them, but it was not something that really could be called a lot of help or anything else. In the sense that we talk about aiding other people, I would say we do not.

The Chairman: Mr. Guay?

Mr. Guay (St. Boniface): I am asking my question, Mr. Chairman, of the Doctor with a lot of respect; I am not skylarking. With the vast amount of experience Doctor, that you have obtained over the years, if, by chance, you were in private enterprise and would be eligible for a bonus for any amount of money which you might save out of the budget, would you be prepared to tell us where you could cut this budget, taking into consideration that you would be on the bonus system? Do you feel in looking at the budget as it is that with your experience you could tell us where you could substantially chop it?

I have had experience, Mr. Chairman, and I am aware that a budget is presented to a board, a commission or a committee with the hope and anticipation that it will be approved by the committee or whatever it is. I think sometimes you certainly could draw the conclusion that we are relatively stupid by the type of question that we ask and, too often, we do not ask that particular question. Let us say—I ask this very humbly—we really need to cut the budget and yet at the same time you are on the bonus system—you must bear that in mind also—where would you cut it, sir?

Mr. Winch: Where would you cut it? You would throw it back to the Minister and let him answer that question.

Mr. Guay (St. Boniface): That was not my question.

Mr. Forrestall: It is a good question.

Dr. Arnell: We are actually discussing Item 5 which is half a million dollars of grants.

Mr. Guay (St. Boniface): Maybe my question was too broad, but I meant it in a broad sense.

• 2150

Dr. Arnell: As far as this area is concerned, we actually took a hard look at this. Many of these associations are of very long standing and have, in fact, provided the nucleus of

reserve organizations and this type of thing. The United Services Institutes have provided the forum where people can get together and often have invited speakers and so on, so it has been the considered opinion that this level of grant to keep military organizations aimed towards keeping the reserves going and so on is, in fact, justified. To attempt to reduce this grant which, apart from the military studies, amounted to about a quarter of a million dollars, was felt unwise. It was felt that this was not an area to cut. Under the circumstances of a short haul the only way you can cut a budget is by getting rid of people, or stopping operating, and it becomes a question of how fast you can get rid of people.

The capital side of this has no new program in it of any consequence. Therefore, you cannot save money by new capital. Most of the programs, as you will see from looking at the big programs and the list, would probably cost you almost as much for cancellation charges as to get the equipment. And you really come back, as I said at the beginning, to the fact that this is strictly a hold-the-line budget. The only way you can save money is by getting rid of people, because as long as you have people you have to feed and cloth them and keep them occupied.

As you will see, a very large percentage of this budget goes to pay, allowances, personnel costs and pension charges, because \$200 million in this budget goes to straight statutory military pension charges of actuarial concurrent contributions.

Mr. Nowlan: Mr. Chairman, I have a supplementary on this point, if Mr. Guay would allow it. Just taking the budget of \$1.6 billion, that is here, either as a dollar figure or as a percentage, and amplifying more or less what Dr. Arnell was saying, what leeway is there, without cuts of personnel, to diminish this budget this year?

Dr. Arnell: There is really virtually none, unless you just want to keep people sitting in their barracks instead of driving trucks.

Mr. Winch: Mr. Chairman, if you are going to discuss that phase I want to go to Vote 15. I want to discuss that very important point on Vote 15.

The Chairman: Members have been gradually getting away from Vote 5. I wonder if we could come back to it.

Have you finished on Vote 5, Mr. Guay.

Mr. Guay (St. Boniface): Yes.

The Chairman: Mr. Lewis?

Mr. Lewis: Dr. Arnell, I am interested in knowing about these Canadian university grants. How did they come about? Did the universities ask you, or was this a notion of the Department?

Dr. Arnell: It really was associated with the fact that for many years there used to be the university reserves, or whatever they were called—the Canadian officer training corps of the Army, the university naval training division of the Navy and the university reserve training program of the Air Force—which ran, if you like, the higher level cadet officer programs within the universities. This program was in nearly all the universities and it normally had a professor directly involved as a reserve officer, who acted as a local commanding officer, and several professors with an interest in military matters. It was by this means that some knowledge of the military and of military thinking, and so on, were in fact introduced into the universities so that there was some connection with the academic community rather than just a complete gap.

• 2155

Because of what came out of the program in terms of future officers, and so on, the military themselves a few years back began to wonder whether it had rather outlived its usefulness in the modern age. It was no longer possible to expose the university cadet to as much as he should know of the actual military way of life in the sophisticated age. With the thought that perhaps the day had come to cut this off, the Canadian forces felt they had to retain some sort of connection with the universities to have an exchange of views.

Mr. Lewis: You are giving the answer at some length. The point is that you initiated this.

Dr. Arnell: And, as a result, it was discussed with the associated universities of Canada, because the universities themselves were very interested in continuing to have this cadet officer scheme. Therefore, this other one was really worked out with the Association of Canadian Universities and Colleges.

Mr. Lewis: Why should the Department of National Defence be interested in subsidizing

a particular kind of program which you call military studies?

Dr. Arnell: Why does the federal government support research in universities? It is, in fact, really a type of research.

Mr. Lewis: Come, come, now; you are not doing any research on a \$50,000 a year chair at a university. You do what you say you do. You are going to have military studies at universities. I appreciate that the amount is not very large. I am not quarrelling about the amount. I am quarrelling about the principle.

Why should you not be just as interested in making a grant to the universities to set up a chair for a study of the avoidance of war, or a study of the causes of war?

Dr. Arnell: These could be done within this.

Mr. Lewis: Why should you be interested in the universities having a chair for military studies?

Dr. Arnell: General Davis has just passed me a note to the effect that he said he took the course at Carleton University this year. He says that the studies are not military but strategic, and that the subjects examined in the course included peacekeeping and arms control, which were just as much emphasized in the course as the broad military strategy type of thing. It is really in the broadest sense a strategic study, if you call it that.

Mr. Lewis: If it have value, and it may well have—and I appreciate that the course is no doubt left to the universities, although you may give some advice but do not control it, I hope...

Dr. Arnell: No we do not.

Mr. Lewis: I would be pretty darned mad at the universities if they let you control it—but if there is value in this kind of course at universities why should it be the Department of National Defence? That is what I cannot understand. Let the Department of the Secretary of State make a grant, or let the Canada Council make a grant—let all sorts of groups do so. Why should you people be so darned interested in making sure that there is a military contact with the people at the universities? Why should you be interested in that?

Dr. Arnell: I do not think this leads to there necessarily being a military contact.

Mr. Lewis: You just said so, Dr. Arnell, three minutes ago. You were explaining how this program came into effect. You said you had the officer training course at the universities, and that there came a time when you decided that there was doubtful value in it from the point of view of getting anything out of it for your forces, and, therefore, there was going to be a gap. This military connection with the universities was—God forbid—going to disappear. Why in heaven's name is it your business to have any military connection with the universities?

Dr. Arnell: It is really up to the university how much of a military connection there really is.

Mr. Lewis: Why should I vote for \$250,000 to go to the universities to promote the military mind? Tell me that.

Mr. Winch: I would be very interested to know if those who took the strategic studies were the leaders of rebellion in the universities.

Mr. Lewis: I do not care whether they were or not, Mr. Winch.

The Chairman: I am not sure that Dr. Arnell can really be expected to answer that last question, Mr. Lewis.

• 2200

Mr. Lewis: I think so. He is here defending this budget. I do not see why I, as one member of this Committee, should vote for any amount of money the purpose of which is to keep this so-called military contact at the universities. I happen to be a person who is not particularly interested—and I was not when I was a student—in having the military mind on the campuses of Canada. Why should you be interested in having that?

Dr. Arnell: I led into my explanation of the Chairs of military and strategic studies by saying that when the time had come to withdraw from the officer cadet programs the Canadian forces wanted to maintain a connection, and they in fact looked at many ways in which it might be done. I would suggest that this solution does not necessarily mean that there is any direct connection at all, because what has been established are five chairs that the Association of Universities and Colleges of Canada have decided to place in certain universities, generally within the institutes of international affairs, in order to have a

professor who will lead the teaching and studies in the strategic area in the broadest sense. And peacekeeping and arms control are viewed as military studies in exactly the same way as the history of war in the fifteenth century.

The Chairman: Do you have any further questions on that, Mr. Lewis?

Mr. Lewis: They are answered.

The Chairman: Mr. Allmand and then Mr. Cafik.

Mr. Allmand: The question I had was answered.

Mr. Cafik: Mr. Chairman, the question I have is a supplementary about this university grant. The \$250,000 being, new this year, strikes me as being a bit odd when we are having a hold-the-line budget and a kind of austerity approach to things, and when it did not exist before. But this leads me to ask—and this may already be answered—whether these chairs have in fact been established. I gather that one has been established at Carleton University. I do not know about the other four. And if they have been established—perhaps I am a little naive as a new parliamentarian—how was this done when Parliament has not approved of this particular \$250,000 grant for this purpose? Was it approved last year? I presume this is the first time it is before the House of Commons and its Committee.

Dr. Arnell: It was approved last year, and in fact authority was given to spend the ROTP money when the cadet corps in the universities terminated. There was money that was in fact put towards the military chairs on the authority of the Treasury Board.

Mr. Cafik: But not through the direct authority of Parliament?

Dr. Arnell: No.

Mr. Cafik: Are all the chairs now established, or are you considering establishing them?

Dr. Arnell: I think they were all established together by, in effect, the Association of Universities. I think they all went into effect. I stand to be corrected. Perhaps I should say that we could provide a written answer to this, and be absolutely certain. But I think they all went into effect last fall.

Mr. Cafik: Are you saying that although there is a new item of \$250,000 here, in fact it is replacing an item of a similar amount in the previous budget?

Dr. Arnell: There would have been money in the other one for what was the URTP.

Mr. Cafik: Would that have been under this same item, Vote 5?

Dr. Arnell: No, it would have been under the reserve item.

Mr. Cafik: So if we were to look there, we would find a \$250,000 decrease?

Dr. Arnell: I think there was more money than that. Yes, there was more money than that. To my recollection this was only a part of what was going into the URTP program.

• 2205

Mr. Cafik: So the result of pursuing this particular program was a reduction in overall expenditures by the Department. Thank you.

Mr. Allmand: A supplementary question on that. You suggested you might provide us with a written answer on this. I would be interested in having a written answer, briefly describing the five chairs and the kind of subjects, if that is possible.

Dr. Arnell: I do not know if we can get the actual subjects that are being taught. We might have to go to the universities. But we can certainly give you the details of the chairs, and where they are and when they were set up.

Mr. Allmand: I would appreciate that.

Mr. Winch: And who the professors are.

The Chairman: We will get that and file it with the Clerk of the Committee, and make it available to all the members.

Mr. Nowlan: It is beyond 10.00 p.m. I do not know what the Chair is going to do, but certainly, unless there was a great unanimity, I do not care to sit much longer than 10.00 p.m. This day we started at 9.30 a.m. in some of these committees.

The Chairman: I think we all agree that we should not attempt to continue later this evening.

Mr. Winch: I have at least five questions on Vote 15, Mr. Chairman.

Mr. Cafik: What are we going to do? Are we going to have another meeting on this subject?

Mr. Nowlan: We are not going to pass the defence estimates in one meeting. Anyone who thought we were, including the Chairman, is rather . . .

Mr. Cafik: I am not suggesting that anybody did.

Mr. Nowlan: I think he did.

Mr. Cafik: Knowing that you are on the Committee, I certainly would not presume such things.

Mr. Nowlan: I hate to say this, Mr. Cafik, but the Chairman might have been off his rocker if he thought we were going to get through this in one meeting.

The Chairman: I am sure everyone is delighted, including Dr. Arnell, in the intense interest which members are showing in the estimates of the Department of National Defence. It is quite apparent that we are not going to finish this evening. I think therefore, if you agree, we will stand Vote 5 that we are now on, and perhaps you could leave it to me to try to work out with officials an appropriate time to re-convene.

Mr. Guay (St. Boniface): Could we not vote on item 5 and get it over with?

The Chairman: I think in any case we have lost our quorum momentarily, so perhaps we could stand that item. There may be some difficulty, because next Wednesday and Thursday, as members know, there is the debate on external affairs and national defence. The following Friday Dr. Arnell may be out of the city, but we will do our best to arrange an appropriate time.

Mr. Nowlan: Since time is of the essence, and since we have all had an Easter holiday of sorts, is there any possibility of a Saturday-long meeting on the budget?

The Chairman: That might be rather difficult, but what about tomorrow morning—Friday morning at 9.30 a.m.?

Mr. Nowlan: No.

Mr. Cafik: I am not too sure about it. There are many people with other commitments then.

The Chairman: Perhaps you could leave it to me to do my best to work out some appro-

priate time. If you are interested in obtaining NATO ties or the SHAPE medallion, you can fill out the form which Mr. Grant has circulated to members and return it to him. The meeting is adjourned until further notice.

Thank you very much, Dr. Arnell. We will be seeing more of you.

APPENDIX UU

14 april 1969

STATEMENT ON THE 1969-70
ESTIMATES FOR THE DEPARTMENT
OF NATIONAL DEFENCE PREPARED
FOR THE STANDING COMMITTEE ON
EXTERNAL AFFAIRS AND
NATIONAL DEFENCE

The 1969-70 Estimates for the Department of National Defence relate to the fifth year of the five-year equipment program for the Canadian Armed Forces which was announced by the Minister and Associate Minister of National Defence in December 1964. This program was the direct result of the Government White Paper on Defence which had been issued earlier that year and was designed to re-equip and improve the mobility of the army; to provide the adequate air and sea lift for immediate deployment in an emergency; to acquire tactical aircraft; and to maintain a relatively constant improvement of maritime anti-submarine capability.

The total planned capital expenditure over the five year period was to be approximately \$1,500 million. Including the capital monies provided in the 1969-70 Estimates, the total funds expended on the Defence Services capital program during this period will be approximately \$1,300 million. This shortfall in expenditure was due in large measure to the inability to spend all the funds which were provided for capital during the first two years of this period. There is always a time lag in achieving a cash flow after a decision is taken to procure a major equipment or weapons system. The drafting of detailed specifications, the invitations to industry to tender, the contract negotiations, and the successful bidder's tooling up-time can result in a period of a year or more before any significant funds are expended on a major project amounting to \$100 million or more in total.

It will be noted that the funds provided for capital in the current Estimates are less than that provided in previous years. This is the direct result of a Government decision to limit defence expenditures in this area to continuing projects until such time as the defence policy review should be completed. As a result, several new equipment projects which might have been considered for inclu-

sion in this year's program were postponed and funds have only been included to meet the anticipated expenditures arising out of the previous approved capital equipment projects.

In the attached annex is a table of selected major equipment items which are currently under procurement showing the estimated expenditures to 31 March 1969, the anticipated expenditures during the current fiscal year and the remaining funds committed to each. This table includes those items listed in the five-year program for which the orders have not been completed. By the end of the current fiscal year, about 75 per cent of the estimated total expenditure will have been made.

Turning to the Estimates themselves, it is to be noted that the total is approximately \$102 million above the revised 1968-69 Estimates which was considered by the Standing Committee on 21 November 1968, after deducting \$5 million representing the value in 1968-69 of the Defence Research Telecommunications Establishment transfer to the Department of Communications after the revised Estimates were printed. This difference is entirely attributable to the result of military and civilian pay increases granted during 1968-69 and to the Government contribution to the Canadian Forces Superannuation Account. These two items together total approximately \$104 million which is slightly larger than the increase in the total Estimates. There have been some adjustments between votes in the Estimates to meet increased costs of supplies, etc., and the changes in the capital program already referred to.

The 1969/70 Estimates, in common with those of other departments, have also been prepared in the new program/activity form and the pamphlet displaying this new approach to Estimates' presentation was distributed to all Members of Parliament after it was tabled on 24 February 1969. It is important to note that this year's Estimates were originally prepared in the traditional form and were tabled in the Blue Book on 4 February 1969. It is understood this will be the form in which they will be enacted in the Appropriation Act. As a result, the main explanations and justifications are therefore in terms of the Blue Book.

When the 1968/69 Estimates were being considered by the Standing Committee last year, a brief was presented on 21 November 1968 which outlined the approach to program budgeting being developed within the Department of National Defence. The program/activity structure used for this year's Estimates is essentially the same as that presented in November, with only such modifications as were necessary for clarification, and is in conformity with the outline proposed to the Public Accounts Committee by the President of the Treasury Board and the staff of the Secretariat for future years' Estimates.

In this new format, the Defence Estimates are presented in terms of Programs, which are in turn subdivided into Activities related to the objectives of the programs. In the case of the Defence Services Program, there are seven activities. The various components of the Canadian Forces are grouped with their

costs under one or other of these activities. However, many of these forces perform more than one role, or are required to meet more than one commitment, which is explained in the accompanying narrative. Because of this, the financial resources associated with these force components have been distributed to the appropriate activities by means of broad pro-rata allocations of the Estimates as originally prepared. As a result, only the general magnitude of the costs attributable to each activity are presented in the new form of Estimates, which can only be considered to be supplementary illustrative information and not accurate cost estimates of each activity. Nevertheless, the Committee members may find it useful to study this new form of Estimates along with the Blue Book, as the two displays of the same budgetary data taken together give a much clearer picture of the intended uses of the requested funds.

NATIONAL DEFENCE
DEPARTMENT OF NATIONAL DEFENCE
1969-70 ESTIMATES
SELECTED MAJOR EQUIPMENT ITEMS

\$ Thousands

Description	Estimated Total Programme Cost	CASH PHASING		
		Estimated Expenditure to 31 March 69	Estimated Cash Expenditure 1969-70	Balance To be paid in Future Years
	(\$000)	(\$000)	(\$000)	(\$000)
DDH CLASS CONSTRUCTION PROGRAM.....	220,692	57,800	57,000	105,892
Continuation of an approved program to construct four modern helicopter carrying destroyer escorts to improve the Fleet's ASW capabilities. These ships will carry the Canadian SEA SPARROW Close Range Missile system, the Variable Depth and Hull Mounted Sonar AN/SQS-505 system, the Italian Oto Malarà 5"/54 Mk. 45 gun, the OOS280 Action Information system and the latest types of electronic warfare and communications equipment.				
OPERATIONAL SUPPORT SHIPS.....	63,308	42,014	17,000	4,294
Continuation of an approved program to construct two ships similar to HMCS PROVIDER to replenish the fleet at sea and provide a limited sealift capability.				
RESTIGOUCHE CONVERSION PROGRAM.....	49,700	10,296	14,200	25,204
Continuation of an approved program to improve ASW capabilities of four ships, installing modern Variable Depth and Hull mounted Sonar (AN/SQS-505/AN/SQA-502) systems and ASROC (anti-submarine rocket) weapon systems.				
OBERON SUBMARINES.....	49,200	45,477	1,400	2, 23
Completion of an approved program to construct three conventional submarines to improve the fleet's ASW capabilities and to provide realistic training for anti-submarine forces (both surface and air).				
BONAVENTURE REFIT AND IMPROVEMENT PROGRAM.....	12,570	12,056	295	219
Completion of an approved program to improve the operational capability and habitability of this ship.				
NAVAL RESEARCH SHIP.....	11,919	9,734	1,985	200
Continuation of an approved program to construct a ship to carry out hydrographic and oceanographic research for the Defence Research Establishment (Atlantic).				
TECHNICAL ENGINEERING SERVICES.....	Recurring Item	Recurring Item	1,290	1,000/annum
A continuing program to hire civilian consultants and design services to determine the most suitable systems and equipments required to meet ships' operational characteristics and the optimum installation arrangements.

MINUTES OF PROCEEDINGS

[Text]

MONDAY, April 21, 1969.
(56)

The Standing Committee on External Affairs and National Defence met at 3.35 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Fairweather, Forrestall, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan-Boundary*), Legault, Marceau, Penner, Prud'homme, Ryan, Stewart (*Cochrane*), Wahn, Winch (17).

Witnesses: Dr. J. C. Arnell, Assistant Deputy Minister/Finance, Department of National Defence and Mr. C. R. Patterson, Director General, Canada Emergency Measures Organization.

The Committee resumed its consideration of the 1969-70 *Estimates of the Department of National Defence*.

Continuing the discussion of *Item 5*, Members were provided with information by Dr. Arnell concerning the grants to *Canadian Universities—Military Studies*, as requested at the previous meeting. Mr. Guay (*St. Boniface*) requested additional information about universities in the Prairie region, which Dr. Arnell will provide.

On completion of the questioning, *Item 5* was allowed to stand.

The Chairman called the Items pertaining to the Emergency Measures Organization, namely *Item 7 Administration and Operation \$1,778,600*; *Item 10 Construction or Acquisition etc. \$220,900*; and *Item 12 Contributions to Provinces and Municipalities etc.; \$3,000,000*.

Dr. Arnell and Mr. Patterson were questioned by the Members on each of these Items. Mr. Harkness requested information on field hospitals, Mr. Guay (*St. Boniface*) requested information on grants to municipalities in Manitoba and Mr. Allmand requested information on the EMO Digest. Mr. Patterson will send reports on these items to the Clerk, for the information of the Members.

The Committee agreed to print a statement on the *plausible attack study*, to be forwarded by Mr. Patterson, as an appendix to this day's Minutes of Proceedings and Evidence (*See Appendix VV*).

Items 7, 10, and 12 were allowed to stand.

The Committee adjourned at 5.45 p.m., until 8.00 p.m. this day.

EVENING SITTING
(57)

The Standing Committee on External Affairs and National Defence met at 8.05 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Barrett, Cafik, Gibson, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Laniel, Legault, Marceau, Penner, Prud'homme, Ryan, Stewart (*Cochrane*) Wahn, Winch (16).

Also present: Mr. Groos, M.P.

Witnesses: From the Department of National Defence: Dr. J. C. Arnell, Assistant Deputy Minister/Finance; Commodore F. D. Elcock, Director General Organization, Manpower and Management; and Brigadier General G. R. Truemner, Director General Personnel Plans and Requirements.

The Chairman called the Items of the 1969-70 *Estimates* relating to Defence Services, namely Item 15 *Administration, Operation etc.* \$1,541,006,000; and Item 20 *Transitional Grant etc.* \$700,000.

Members of the Committee questioned Dr. Arnell on these items, with particular reference to personnel matters. Mr. Howard (*Okanagan-Boundary*) and Mr. Legault requested additional information concerning reductions in the number of Officers. Mr. Cafik requested information on pay fields. Dr. Arnell will provide this information. Commodore Elcock and Brigadier General Truemner assisted Dr. Arnell during the questioning.

Items 15 and 20 were allowed to stand.

The Chairman re-called Items 5, 7, 10 and 12 which were severally carried.

The Chairman re-called Items 15 and 20.

Members continued their questioning under these Items. Dr. Arnell will provide a statement dealing with medical personnel, as requested by Mr. Ryan.

With the questioning continuing, at 10.05 p.m. the Committee adjourned, until Tuesday, April 22, 1969 at 8.00 p.m. when the Committee will consider the *Estimates* of the Department of External Affairs.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Monday April 21, 1969

The Chairman: Gentlemen, we have Dr. Arnell from the Department with us again.

Last week we dealt with Vote 1 in some detail and stood it, and then we dealt in some detail with Vote 5 and I believe we completed most of the questioning. However, questions were raised with regard to grants to universities for military studies, and in accordance with suggestions made in the Committee, Dr. Arnell has further information on that subject. After he has given that information to the Committee, unless members have other questions on Vote 5, we will proceed with the votes relating to the Emergency Measures Organization. Dr. Arnell.

Dr. J. C. Arnell (Assistant Deputy Minister, Finance Division, Department of National Defence): Mr. Chairman, I thought that the best way of answering the Committee's questions on the university program and the chairs of military studies would be to refer to two press releases. If it is the wish of the Committee, these could be included as appendices.

The first of the two was an announcement on October 2, 1967, in which information was given out for the planned discontinuance of the reserve officers training plans at the universities. They are the three to which I referred last Thursday night—the University Naval Training Divisions, the Army's Canadian Officers Training Corps and the Air Force's University Reserve Training Program.

That announcement went on to say:

The Department of National Defence, to foster the development of military studies at the university level, will propose the establishment of courses in military studies at some Canadian universities, together with post-graduate fellowships and research grants.

Some statistics were given of the number of officer cadets in training, and so on.

The second press release was on the 3rd of July 1968, in which it was announced that:

Professorships of military and strategic studies will be established at five Canadian universities this fall.

meaning the fall of 1968

under a new program developed by the Department of National Defence and the Association of Universities and Colleges of Canada.

And here I must correct an implication I made last time about which universities are taking part. The press release reads:

Taking part in the new program will be Acadia University, Wolfville, N.S.; Laval University, Quebec City; Carleton University, Ottawa; Queen's University, Kingston, Ontario; and the University of Victoria, Victoria, B.C.

The professorships will enable both graduate and under-graduate students to study problems of international and national security in a Canadian context.

The remainder of the announcement relates to the financial support of \$250,000 that we were discussing last week. This support

will include salaries, university overhead, and reference material. Graduate scholarships, fellowships and individual programs of research may be included.

It speaks of the recruitment of staff and development of course content as the sole responsibility of each university. And it goes on as follows:

It is expected that the establishment of these professorships will encourage and contribute to objective and informed study of all aspects of Canadian defence problems in the broad content of international security.

And it concludes with the statement:

The Universities receiving professorships were selected by a Committee headed by A. D. P. Heeney, Chairman of the

International Joint Commission, with representatives from the A.U.C.C. and D.N.D.

The question was raised as to how this was funded last year, and the Committee might be interested in the figures. At the time the 1968-69 estimates were put together, just over \$1.5 million was provided for the total of the university officer training plans, all three of them. With the decision to phase out any new officer cadets and to run down these training plans, only \$287,000 of that money will be spent, when the accounts are finalized for last year, on what is now spoken of as the Reserve Officers University Training Plan. And out of that \$1.5 million, \$141,000 was used for the beginning of the establishment of the chairs in the universities.

In this year's estimates, as we were discussing last Thursday night, there is \$250,000 in Vote 1 for the military studies, and in Vote 15, the Defence Services vote, there is \$294,000 for the continuation of this Reserve Officers University Training Plan, to finish it off. I think that covers the point that was raised on Thursday night, Mr. Chairman.

The Chairman: Thank you, Dr. Arnell. Are there any further questions on Vote 5?

Mr. Guay (St. Boniface): Could I go back for a moment, Mr. Chairman? I am particularly interested in Western Canada. I think we have often been overlooked, and possibly there is a reason why we are being overlooked again. I took note of the universities Dr. Arnell mentioned, and I also took note that no university in the Prairie Provinces, namely Manitoba, Saskatchewan and Alberta, was named as one in which these studies will be made. Could he explain to the Committee why the Prairie Provinces are left out entirely in this program?

Dr. Arnell: The choice of the universities was made in two stages. First, universities were invited to apply if they were interested,

• 1540

and quite a number of universities did so. As I mentioned in the course of going over this, the actual selection was done by a committee made up largely of representatives from the Association of Universities and Colleges of Canada. So that in large measure the choice was made by the university representatives themselves.

Without digging into the details, I cannot tell you offhand which universities in the Prairie Provinces applied for grants. But the selection was put in the hands of a committee, so that would be largely the decision of the universities themselves as to which universities got chairs. I believe that provision was also made for other universities to associate themselves with the program by local co-operative arrangements. To date I have not heard of any doing this, although they may have.

Mr. Guay (St. Boniface): With your permission, Mr. Chairman, I have a further question. Is this committee which made the final choice situated in Ottawa?

Dr. Arnell: No; I think the representatives, in fact, came from the universities. I do not know that we have a list of the actual people, but my understanding is that they were representative of universities right across the country. If you really want the information I am sure could dig it out.

Mr. Guay (St. Boniface): I would like to have it, Dr. Arnell. I want to find out, first of all, whether universities in the Prairie Provinces applied, and, if so, the reason for their not being given any consideration.

I understand it could very well be that they did not apply, but if they were interested and did apply then I think we should also know the reason for the three provinces being bypassed.

The Chairman: Mr. Guay, would you like to know the members of the committee which made the selection?

Mr. Guay (St. Boniface): Yes, I would, Mr. Chairman.

Dr. Arnell: I think we might have to go to the committee, because it really was not something done within the Department. It was really so that it would not be a choice made by the Department of National Defence that this was really put to the universities to sort out. I think if the information is desired I could try to get it and provide it as an appendix to the minutes.

Mr. Guay (St. Boniface): Mr. Chairman and Dr. Arnell, I appreciate that greatly. But the fact remains that it is the committee that is spending the money, and that being the case I am concerned.

The Chairman: The information we would like to get, Dr. Arnell, however it is obtained, is first of all, whether any prairie universities did apply; second, who were the members of the committee that made the decision; and, third, what were the reasons, if they did apply, for no prairie university being given the opportunity to participate.

Dr. Arnell: The only information I have is that 14 universities originally applied.

The Chairman: Are there any further questions on Vote 5?

Mr. Forrestall: I have one brief question, Dr. Arnell. On page 239 of the estimates there is an item in the amount of \$50,000 for the Navy League of Canada. I am curious about why it does not appear as a recurring item.

Dr. Arnell: I think I mentioned it in passing on Thursday night. The three cadet organizations of the navy, the army and the air force are in large measure voluntary organizations run by interested citizens for the cadets.

For many years the air force supported the Air Cadet League with some money. It was a very large and active group and the money helped them with their summer camps and other training. The other two cadet organizations preferred to operate entirely on voluntary donations which they themselves collected.

During the past years the Navy League of Canada, which handles the naval cadets, found that with increasing costs they simply could not continue on a voluntary basis, and they applied for support from the Department. The Department has always viewed the cadet movement as a very valuable asset, because it has been found over the years, in the air force in particular, that among the recruits there are a very surprisingly high proportion who in fact have been air cadets. The same has really also been true of the other two cadet organizations.

As a result, because the air cadets had in fact been supported for some years, when the Navy League also applied for help, it was considered both desirable and reasonable to include them.

This is really the beginning of what presumably will be a continuing grant to the Navy League and one might anticipate, with the continuing increase in costs, that perhaps the same thing may take place with the army cadets in the course of time.

Mr. Forrestall: Thank you, Dr. Arnell.

The Chairman: Have you finished, Mr. Forrestall?

Mr. Forrestall: I surely wish to ask your direction on something I cannot find anywhere in the estimates. I wanted to ask questions about the financial position of the Department in relation to the construction of headquarters for *HMCS Scotian* in Halifax.

Dr. Arnell: That will be in Vote 15.

The Chairman: We will be coming to that a little later.

Mr. Howard (Okanagan Boundary): Mr. Chairman, while we are on this subject of cadet organizations, I have been a little surprised to find that although the cadet organizations are officially recognized by the military forces they seem to be rather like stepchildren of the organization.

I have received complaints from officers working with these organizations about what happens when they try to obtain used military equipment required by the organizations. As an example I will cite band instruments. They have attempted to obtain these used pieces of equipment that the other military forces have declared surplus and are getting rid of. They find that they cannot even buy them out of their own pockets from the military forces that they have to go through a Crown Assets Disposal proposition; and that they are unable to do this because Crown War Assets Disposal Corporation handles these items on a very large quantity basis.

It does not seem to me to be a very good use of funds to give these organizations the money to operate and then have them go and buy back, through civilian organizations, equipment which has previously belonged to military forces and which has been sold at a fraction of its original cost. May I have an explanation of that?

Dr. Arnell: I do not have any detail on this particular aspect of the situation. In fact, I do not think I have ever heard of this particular problem before.

Generally speaking, I think, if it is known that there is such a situation as you have just outlined something could be done in the course of disposal. Quite often it is not until after a declaration has already been made to Crown Assets that the needs of such an organization as the Cadet League will become known and then efforts are made to give

them an opportunity to bid on the equipment. Undoubtedly there will be cases in which somebody will hear after instruments have been declared surplus that such is the case and will find perhaps that there are too many involved.

• 1550

Mr. Winch: May I just add some information here, Mr. Chairman?

The Chairman: Mr. Winch, is this a supplementary question?

Mr. Winch: I wish to inform the hon. member that I also have had applications in Vancouver and have never had any difficulties whatsoever over the years. The procedure is that when you receive the application—whether it be from a cadet league or a legion band, I have even had them from legion bands, you send the letter to the Department of National Defence, knowing the equipment is going to be declared to Crown Assets Disposal, and in my experience it has worked out wonderfully well—is that the Department of National Defence in turn notifies Crown Assets Disposal Corporation so that the Cadet League or the Legion or the Navy League who are after this send a letter to the Department of National Defence and a letter to Crown Assets. I have yet to find one solitary instance when they have not been able to obtain the equipment at a price which is so low that I have not had one complaint. That is the procedure that is followed in Vancouver, if it is of any use to you, sir.

Mr. Howard (Okanagan-Boundary): I appreciate that information very much because I know of cadet organizations who have not been able to do that and I will be very happy to follow that advice.

Mr. Winch: We have not failed once in Vancouver in that respect.

Dr. Arnell: In general that is the way I would have expected it worked. It is a case of knowing ahead of time, you cannot really do much after the event sometimes.

Mr. Howard (Okanagan-Boundary): I know. You can assure me it is a policy that where equipment of that kind is available other military organizations in Canada can buy it before it is sold publicly? I can be assured of that?

Dr. Arnell: Yes.

Mr. Barrett: I might say, Mr. Chairman, it is the first time I have heard of anything being of benefit to Vancouver from that same source.

Mr. Winch: Well we have no little that I am happy to say we have had some results in this regard.

Mr. Barrett: Very good.

Mr. Guay (St. Boniface): On the other hand, Mr. Chairman, sometimes we do hear a lot of complaints and when we investigate we find out that they really did not ask for these things. I think it might be very interesting to find out in the case of Mr. Howard, and I am not suggesting that he did or did not, but I think it might be interesting to know if they really asked the Department of National Defence for this particular help. Did they do it in writing, and if so, when, and is it possible to follow it up? If one can do it and get it, the other one does not, then I think we should know about it.

Mr. Howard (Okanagan-Boundary): Well I, of course, found this on a file which indicates they have been unable to get through the red tape and obtain these pieces of equipment.

The Chairman: Are there any other questions on Item 5?

Mr. Guay (St. Boniface): I was going to ask one more question, sir, pertaining to this. Over and above the increase in cost, could Dr. Arnell explain the increase of well over \$1 million, is it a million or billion; from \$6 million last year to \$7 million this year?

The Chairman: Are you back on Item 1?

Mr. Guay (St. Boniface): I am speaking of Item 5 on page 234. The total there is \$7 million and last year it was \$6 million which is over \$1 million increase.

Dr. Arnell: This is a combination of Item 1 and Item 5, the total figures there. You will find the Item 5 figures are the \$546,375 and the \$246,375 in the two columns. Of that \$300,000 increase, \$250,000 relates to the university support, and the other \$50,000 is the Navy League of Canada grant. The increase above that relates essentially to the departmental salaries of the Deputy Minister's staff and so on. The actual details of the increases are on pages 238 and 239.

• 1555

The Chairman: Are there any further questions on Item 5? If not, perhaps we can stand that item and we will pass these items in a group later on.

Item 5 stood.

The Chairman: We will pass on to the next item which is Item 7. Members will notice that Items 7, 10 and 12 all relate to the Emergency Measures Organization. I think I have to call each item separately but perhaps if members agree we could discuss the items as a group because they all relate to the same general matter. Indeed, they are dealt with I think as Item 5 in the new form of estimates. Is that satisfactory to members?

All right, I call Item 7, Item 10, and Item 12; I will accept questions from members on any or all of these votes. Mr. Harkness?

Department of National Defence

Emergency Measures Organization

- 7 Administration and Operation—\$1,778,600.
- 10 Construction or Acquisition of Buildings, Works, Land and Equipment, including authority to make recoverable advances not exceeding in the aggregate the amounts of the shares of the Governments of the Provinces of the costs of joint programs—\$220,900.
- 12 Contributions to Provinces and Municipalities for Civil Defence purposes—\$3,000,000.

Mr. Harkness: Mr. Chairman, I have been concerned that the Emergency Measures Organization activities seem to have been constantly melting away. Even the figures we have here show quite a decline from the year 1966-67 to the present. And 1966-67 was a decline from four, five and six years earlier. It has always seemed to me that one of the most important things that could be done in the way of defence was civil defence. In the event of the worst happening, through an effective civil defence organization, probably many millions of lives could be saved which otherwise would be lost. As a result, I think it is a disturbing development that the amount of activity as far as Emergency Measures is concerned has been declining so steadily and so rapidly. I do not know who is the official now in the position of Director General, Canada Emergency Measures Organization, but I wonder if we might have an

outline of just what activities have been dispensed with, and which ones are being carried on at the present time.

Dr. Arnell: Well, Mr. C. R. Patterson who is the Director General of the Emergency Measures Organization is here with me, but before asking him to say anything I would like to point out that in Item 7 you will note that quite a sizable amount of the decrease is related to salaries and wages.

As part of the transfer of the Emergency Measures Organization from the Department of Industry last year into the Department of National Defence there was an amalgamation of a number of staff functions with the result that the headquarters of the Emergency Measures Organization was reduced in size and this has resulted in a decrease in the requirements for salaries.

Perhaps the largest decrease shown there is the decrease for professional and special services. I understand this is due in large part to the completion of a large consultant study that had been under way last year and the continuing moneys are the moneys available, some \$292,000, for whatever consultant they may feel they need to call in. The other sizable decrease is the one shown in Item 12 where the contributions to the provinces and municipalities have, in fact, been cut further. Perhaps as you have asked for it Mr. Harkness, I might ask Mr. Patterson to join me here for a few minutes and answer some questions for you.

• 1600

The Chairman: Mr. Patterson would you like to comment upon the question raised by Mr. Harkness?

Mr. C. R. Patterson (Director General, Canada Emergency Measures Organization): The reductions that took place in Emergency Measures Organization began basically in the fall of 1967, or at least for the budget 1967-68. At that time, when the government was cutting expenses I went to see the Minister. The Minister at that time asked where we could actually reduce expenses and still carry on with a program? In common with many other departments the biggest items cut at that particular time were capital construction and the capital purchase items. When we talk about capital construction, capital construction is generally involved with matters such as the development of regional emergency government headquarters, of which you are well

aware and for which we have an on-going program. We had at that time planned to rebuild the school in Arnprior and, of course, as far as capital purchase was concerned, there was a fair amount involved in emergency communications equipment and in radiological defence equipment, and basically this was it. At that particular time, too, we were spending in the neighbourhood of \$600,000 or \$700,000 a year in the fall-out shelter survey. There was also a big reduction in the 1968-69 budget with respect to provincial participation in civil emergency measures. The big change in direction at this particular time was this. The attempt was made, along with the reduction in expenses, to continue a viable and on-going program using existing resources. This really meant that the expenses involved in recruiting and training large numbers of volunteer workers were reduced. Also, the number of people and the amount of money available for local co-ordinators, et cetera, were reduced. This was in line with the modern thought which applies to more than Canada—it applies to the western nations as a whole—that civil emergency measures really exist as a development of plans and preparations for the utilization of those resources that are available at all levels of government. It was the intention of the government of that time to ensure that every federal government which has a responsibility that it carries out in peacetime that would have a comparable job in wartime would take as part of its regular, every-day efforts the job of planning for wartime as well.

The same thing applies to the provinces. The provinces, as a matter of fact, in some cases have bills and in some cases actually have orders in council in which they have done the same thing. As a result of the reduction to \$3,750,000 in the 1968-69 period and \$3 million in the 1969-70 period, there has been quite a change in the form of provincial management and provincial organization but every province is still involved in the Civil Emergency Measures Program.

As Dr. Arnell said, there have been changes in the headquarters program of the Canada Emergency Measures Organization.

• 1605

We had 150 personnel all together in the year 1968-69, which was our establishment, and this has actually been reduced to 92 for the year 1969-70. However, 30 positions, as Dr. Arnell has already said, were originally

allocated to our administrative problem and these 30 positions are substantially replaced by the work that the Deputy Minister's office carries out. At the Canadian Emergency Measures College at Arnprior we had 48 positions. For a long time it had been considered that we should actually, from the point of view of economy, go to a different system of messing there; and as a result of reductions which we have been able to make this year, we are going to a system of messing and our complement at the Canadian Emergency Measures College has dropped from 48 to 22. Mind you, we have exercised every possible economy in every aspect of the Civil Emergency Measures Program to fit within this \$5 million budget which we have in Canada EMO.

We have in each province a regional office of the Emergency Measures Organization which we have reduced in all the provinces to one co-ordinator and one secretary, and this gives us 20 people across Canada. Those are where the reductions have taken place generally. Would you like to be more specific on it?

Mr. Harkness: I might just say that as far as this reduction in administrative expenses is concerned as well as the cutting out of a number of positions as a result of putting the Emergency Measures Organization into the Department of National Defence, I think it is all to the good. I am fully in favour of that as I can quite see how having this Organization in the Department does make possible the savings of a considerable number of administrative positions. I have no comment on that. But when we come to your equipment and building program, what is the situation now as far as these regional headquarters are concerned? How many of them have actually been completed and how many are in operation?

Mr. Patterson: There are six across Canada that are totally completed. That is Nanaimo, Penhold, Shilo, Camp Borden, Valcartier and Debart. As you know, their plans are for a regional emergency government headquarters at every provincial centre and there are interim headquarters with communications at the other centres.

Mr. Harkness: Are these headquarters manned and in operation?

Mr. Patterson: Yes. At the time that the reductions were announced there was no major system in existence that was dropped.

In other words, the emergency communications system across Canada is still fully manned. The regional emergency government headquarters are manned. The warning system is manned on a 24-hour watch basis. The Canadian Broadcasting Corporation maintains the emergency broadcasting system. So all these systems are still being maintained, Mr. Harkness.

Mr. Harkness: Are there any plans to complete these headquarters in the provincial regions which have not got them up to date?

Mr. Patterson: At the time that the announcement was made, the government made a statement to the effect that capital construction and capital purchases were being deferred. That was their term; not cancelled but deferred.

Mr. Harkness: They are more or less deferred indefinitely, I take it?

Mr. Patterson: No, I could not really say that, Mr. Harkness. We still talk in terms of a total program. In fact, when we talk about the program of Emergency Measures in Canada we talk about all the associated departments, all the provinces, a system of emergency government headquarters, a communications system, a provincial-municipal radiological defence system. We are still thinking in terms of the total amount.

• 1610

Mr. Harkness: As far as equipment is concerned, was the program for provision of radiological detection equipments completed? Is that one of the reasons why the amount allocated for acquisition of equipment has steadily fallen in the three years that are shown in the book 1966-67 to the present year 1969-70 from \$743,000 to \$220,000 a year?

Mr. Patterson: The radiological defence equipment purchases are about two-thirds completed. Last year we had stock on the shelves. The provinces actually bought a large amount of equipment from us last year and depleted our shelves. We have enough money in this year's budget for another thousand low-range meters which I think will meet our requirement for this year. Mind you, when you talk about a program of this nature, what you are doing is talking about the capacity of the province to deploy it. We have been able to maintain the number of instruments necessary to meet the provinces' demands up to this point.

Mr. Harkness: What about other equipment? Has there been any provision made in recent years for other equipment such as fire-fighting equipment and so forth?

Mr. Patterson: Fire-fighting equipment is not considered at this particular point in time to be an item that we normally purchase under the Canada Emergency Measures program.

Mr. Harkness: There was a program of adapters so that any type of equipment could be used.

Mr. Patterson: The adapter program has been completed. It is a matter of interest that when they had the riots in Detroit the fact that we have these adapters in Windsor enabled the Windsor Fire Department to go across the bridge and connect to many fire hydrants that other fire departments in the United States could not do because they did not have the adapters that we have.

Mr. Harkness: But in any event that adapter program is completed?

Mr. Patterson: That is right.

Mr. Harkness: And it is in operation throughout Canada?

Mr. Patterson: That is right.

Mr. Harkness: What about the emergency hospital equipment, a considerable amount of which was shipped off to Viet Nam, as I recall?

Mr. Patterson: I think there were four hospitals shipped to Viet Nam. I cannot tell you the exact number of hospitals that were purchased. I think it was in the neighbourhood of \$18 million to \$20 million worth of equipment that was purchased for these hospitals. These have been, in part, deployed. Some are in storage at Plouffe Park and some are in storage at central storage in the Province of Quebec. As I say, some have been deployed.

Mr. Harkness: What do you mean by "deployed" in this case?

Mr. Patterson: When I say "deployed" in deploying an emergency hospital, which is a hospital that has 200 beds and so on, a contract has to be arranged to send the hospital to a point where there will be a secondary school or a large building that can actually be set up as wards, and then arrangements are made with the provincial government for the

secure storage of this equipment, the replenishment of drugs, and things like this. Some of this equipment has to be refrigerated, some kept warm, some kept dry, and so on and so forth. This is the basis of deployment.

Mr. Harkness: How many of them have already been deployed?

Mr. Patterson: This I cannot answer. I would have to ask Dr. Crawford about that. As a matter of fact, I expected to see Dr. Crawford either tonight or tomorrow night because they have one of these hospitals set up right here in Ottawa at the present time for demonstration in the pavilion at Brewer Park.

Mr. Harkness: Well, what about those that were deployed to Viet Nam—and I think there was one sent somewhere else?

Mr. Patterson: There was one sent to Yellowknife.

Mr. Harkness: To Yellowknife?

Mr. Patterson: That is right. Part of the hospital was sent to Yellowknife and recovered.

Mr. Harkness: Were there four sent to Viet Nam?

Mr. Patterson: That is right.

Mr. Harkness: Have they been replaced in central storage?

Mr. Patterson: I could not answer that question.

The Chairman: If the two items that Mr. Harkness has asked about could be furnished to the Clerk, perhaps we could include them in our records. The first one, Mr. Harkness, the information as to whether or not the four emergency hospitals have been replaced?

• 1615

Mr. Harkness: —the deployment—how many of these hospitals have actually been put out in various areas in Canada and are available on the spot?

Mr. Patterson: Yes.

The Chairman: And also what has happened to those that were deployed.

Mr. Harkness: And also if the ones that have been sent out of the country have been replaced?

Are there any plans to increase the number of these mobile hospitals?

Mr. Patterson: What we are dealing with right at the present time is that while the Canada Emergency Measures Organization is a co-ordinating group, it does not have control, although it discusses the plans with the various departments. During the years 1969-70 there are no plans for the enlargement of this.

Mr. Harkness: The Emergency Measures Organization provided the funds to purchase these hospitals to begin with.

Mr. Patterson: No. The Department of National Health and Welfare actually provided the funds.

Mr. Harkness: That may be so, but my memory was that the funds were provided out of the Emergency Measures Vote to the Department of National Health and Welfare which then purchased the hospitals, but that the actual financing of them came through the Emergency Measures Organization.

Mr. Patterson: I would have to check on that, Mr. Harkness. I have been with the Organization for four years and during that four year period we have not had any involvement in the expenditure of health moneys, with the exception of the money that goes through the financial assistance program to the provinces for the hiring of health planners with the provincial departments of health. As far as the Department of National Health and Welfare is concerned, they have actually provided the doctors and the pharmacists in the field in the various provinces for the maintenance of these deployed hospitals where they exist.

Mr. Harkness: When you come to the matter of contributions to provinces and municipalities, which have dropped to about half of what they were three years ago—and that was a drop then considerably from what they had been previously—what is the explanation for that?

Mr. Patterson: As I was saying beforehand, one of the requests of the government in the fall of 1967 was to reduce planning expenditures as much as possible. Each province took to its own devices as far as reducing planning

expenditures was concerned. On the whole, what has happened is this: they have reduced, as the Canada Emergency Measures Organization has reduced their central corps, to get a major job done, to the number of people required on the basis of one man per job.

Mr. Harkness: That is not actually so in the Province of Alberta, is it?

Mr. Patterson: They have quite done so considerably.

Mr. Harkness: They send me their monthly pamphlet all the time, and I gather from it that is the one province which really has not reduced its expenditures and activities.

Mr. Patterson: They have actually reduced their headquarters expenditures. I might say that the Province of Alberta and the Province of British Columbia are two provinces—and other provinces from time to time—that have almost annually supplemented the amount of money that is given to them by the federal government. They are both very interested in the peacetime disaster planning as well in the wartime disaster planning, especially in the Province of British Columbia where you have more possibility of peacetime disaster situations. Rather than having a basis of what you might call 75-25 or 3 to 1, they are working on about a 50-50 basis with the provincial support of the program.

• 1620

Alberta has reduced its headquarters program to a certain extent and I know that because I was talking to Arnold Lavoie when I was up there recently. As I say they have supplemented this as well, themselves. If you want to go back to how some other provinces have dealt with it, in the Provinces of Saskatchewan, Newfoundland and New Brunswick, to take three examples, they have taken what you might call a provincial-regional approach toward developing civil emergency measures. So, naturally, you do not have a co-ordinator in each small community; you have a co-ordinator in an area or a region. The Province of Quebec, for example, has done away, as result of the expenditures, with quite a large number of what you might call part-time co-ordinators who have been employed locally. They have established co-ordinators who have several municipalities under their control, and this sort of central co-ordinator

or area co-ordinator deals with the municipal clerks in the various centres and the mayors of these towns can actually charge the town or municipal clerk with the responsibility of establishing a plan. I was in Quebec two weeks ago and looked at their program at that time. They had at that particular point 239 communities of 2,000 population or better in which the mayors have named a town clerk as an unpaid coordinator and the 13 service supervisors. When I talk about a service supervisor that is the chap from the police, the chap from the fire department, the chap from health, from welfare, from public works and so on. Each one of these is charged with the responsibility of establishing a plan. This is what I mean by, say, getting back to planning for use of the potential in any government organization be it municipal, provincial or federal, rather than what you might call developing a fourth arm that it is supposed to rise up and defend the country from the civil point of view.

Mr. Harkness: What in effect has been the result of the 50 per cent reduction in grants to provinces and municipalities in the last three to four years? In other words what is not now being done which was being done, or how has it been possible to reduce these grants?

Mr. Patterson: The provinces are up against the same thing that they are federally at the present time as far as capital construction and purchasing equipment is concerned. While they are maintaining their emergency communications systems at their present level they are not able to expand the communication systems unless they cut personnel costs drastically in some areas. It is pretty hard to cut it drastically at the level it is at the present time.

Mr. Guay (St. Boniface): I have a supplementary, Mr. Chairman.

Mr. Chairman: A supplementary, Mr. Guay?

Mr. Guay (St. Boniface): Pertaining to municipalities and provinces but particularly to municipalities of which Mr. Patterson is speaking, could you show us what they were getting and where the reduction took place, also which provinces were receiving it and which are not receiving it now. The reason I ask this question, Mr. Chairman, is that I have yet to know of, at least in the municipalities in which I am interested,

a province in receipt of actual grants. Possibly I come from a province that is not too active in civil defence—at least I feel that way—and sometimes I question the amount of money we spend on civil defence in relation to the benefits which we receive. May we have a statement of the grants given to municipalities, for example, in 1967, 1968 and 1969 so that we can see how much we will be losing under this year's new policy.

Mr. Patterson: Mr. Chairman, this is a matter of provincial preference. What happens at the present time is that you take the amount of money that the federal government provides for the subsidization of the civil emergency measures programs in the provinces and divide it among the provinces on a per capita basis. Then, when it goes to the provinces on a per capita basis,

• 1625

they have the complete say as to how this is being used, within a certain number of guidelines of course that we provide. In other words they have certain lines of equipment they can purchase and they can also employ planners, coordinators and so on in accordance with what they consider is a suitable organization for their particular province. That does vary from province to province. So we do not actually have the allocation to the municipalities.

Mr. Guay (St. Boniface): So, the province must spend this money on civil defence, and there is a federal provision that if they do not use it they have to return it. Is that not correct?

Mr. Patterson: Towards the end of the year we get an indication from the various provinces of what they are going to use. If there is going to be some money left over in province A and province B in its project at the beginning of the year—they put up a project each year—indicates that it wants to actually spend a certain amount of money for the purchase of communications equipment then we can actually consider allocating the overage from one province to another. I believe my accountant told me that this year we are going to have unspent about \$3,000 out of the \$3,750,000 for the provinces.

The Chairman: Mr. Patterson, following that up, would you not get a report from each province on how they spent their money?

Mr. Patterson: Yes.

The Chairman: If so, would you not have a list of the municipalities in which there had been assistance? I am merely wondering whether, somewhere in your files you would have the information that Mr. Guay has requested.

Mr. Patterson: I have a massive amount of information. Each province at the beginning of the year submits a project saying what it wants to do, that is approved by their minister and submitted to the Minister of National Defence who, in turn, approves it. This indicates what they are going to spend provincially and how they are going to break this down into municipal projects. Do you want total information, a sample, or some specific area?

Mr. Guay (St. Boniface): Mr. Chairman, possibly the other members are not too interested but I would like it for the province of Manitoba.

The Chairman: Yes. You spoke of estimates at the beginning of each year, but we are interested in actual expenditures which presumably would be set out in the report which you get at the end of the year.

Mr. Patterson: Well, the auditor works on the basis of the project. In other words they cannot reallocate from one aspect of the project to another without the authorization.

Dr. J. E. Arnell (Assistant Deputy Minister, Finance Division, Department of National Defence): I understand that Mr. Guay would like, say the 1968-69 report as it looks at this time of year before it is finalized. That would be very close to a full report.

Mr. Guay (St. Boniface): Perhaps you could show me one from a previous term, which might be easier to produce than the latest one.

Mr. Patterson: I would be glad to produce it.

The Chairman: That is for the province of Manitoba.

Mr. Harkness: I have one other question. What exercises has the Emergency Measures Organization carried on during the past two years?

Mr. Patterson: At the present time they are getting ready for a NATO exercise, Civil Logistics 1969, which is the civil emergency measures activities of Canada with respect to

NATO. In 1966—and this happened while I was in Quebec City for ten months—they carried out the Tocsin exercise. I think that you actually were involved in the Tocsin exercise some time before. Then they were involved in Fallex along with the Canadian Forces headquarters. Then in 1965 they were again involved in Civlong 1965, which again was a NATO civil logistics exercise.

Apart from that we provide what you might call an exercise situation for the provinces and the provinces actually can exercise any municipality or group of municipalities as they see fit. For instance, back in your own city in the spring of 1966 they had an Evacuate the Nation exercise up to Didsbury from Calgary.

Mr. Harkness: I take it there has been no full-scale exercise making use of central, provincial and regional headquarters, Signals and so on since 1966 then?

• 1630

Mr. Patterson: That is right.

Mr. Harkness: Is there another full-scale exercise...

Mr. Patterson: I am sorry; I was talking about a civil emergency measures exercise.

Mr. Harkness: Is any full-scale Emergency Measures Organization exercise planned for this coming year?

Mr. Patterson: Not for this coming year, no.

Mr. Harkness: So by the time there is another one there will be a gap of four or five years.

Mr. Patterson: As far as a straight civil emergency measures exercise is concerned, that is right. As far as participation with Canadian Forces is concerned, that is not correct because we have an input as far as they are concerned, merely as observers. We had headquarters and field people deal with some of the exercises in the United States to see how they were carrying on their civil emergency measures program as well.

Mr. Harkness: I would just like to observe, Mr. Chairman, that when we come to consider our report I think we should examine the matter of whether we should put in a recommendation on the necessity for or value of having more frequent full-scale emergency measures exercises. I think there is no question that because of the rapid change of per-

sonnel that takes place in all government departments, if you do not have an exercise more than once every five years the system is just not going to work when it may be called upon to do so.

The Chairman: Thank you very much, Mr. Harkness. Mr. Penner?

Mr. Penner: Mr. Chairman, I would like to pursue just a little further a matter that Mr. Harkness referred to in his questioning. This has to do with the program whereby grants were available for municipalities for fire-fighting equipment. It is my understanding that municipalities could purchase fire-pumpers, and you mentioned the adapters which were used in Detroit. Perhaps you could just explain to the Committee what these adapters did.

Mr. Patterson: This was what you might call a hose connector standardization program that took place across Canada. This program was started by Major-General Worthington, first of all, because he felt that if you were going to do anything in the area of mutual help and especially in the area of fire, you could not do it with the large variety of equipment that exists across Canada. This is why an adapter program or standardization program was developed across Canada.

Second, as far as pumpers are concerned, it was really a fire-pumper trainer that was provided in the first place. The attitude today, because of the many claims on money set aside for the Emergency Measures program, is that there are more essential things in the provinces and the municipalities than the fire-pumper program. In other words, nobody says that in a fire-pumper program a fire-pumper is not of benefit in connection with any fire situation, whether it is in an attack or otherwise, but we are saying that there are other things of more immediate necessity. After all, fire-pumper programs do go on in the municipalities irrespective of the Civil Emergency Measures program. If the Civil Emergency Measures program stopped today there would still be fire-pumpers, fire-fighting equipment all the way across Canada.

One of the guidelines given by government back in January 1968 was that money allocated to capital construction in the field of civil emergency measures should be for the purchase or construction of equipment or buildings that would not be immediately available

from the economy or from the area surrounding or from its normal resources. This is why the fire-pumper program has gone down the drain.

Mr. Penner: I believe you said, Mr. Patterson, that this program was completed; actually it would be more correct to say that it was terminated.

Mr. Patterson: The standardization program.

• 1635

Mr. Penner: No, the fire equipment program.

Mr. Patterson: No, I was talking about the adapter program.

Mr. Penner: It was just the adaptor program that was not completed?

Mr. Patterson: That is right, the standardization program.

Mr. Penner: I am not so sure I could agree with the policy you outlined, particularly in certain sections of Canada such as northwestern Ontario where a number of communities are located squarely in the bush. Their economy cannot, in fact, support this special sophisticated equipment and every year they are faced with the threat of extinction from fires that get out of control. Of any program that the Emergency Measures organization had, this one was the most welcome because it meant that many of these communities could look forward to getting this equipment and having a measure of safety that otherwise they could never hope to acquire from their own revenue.

In many cases in northwestern Ontario communities applied year after year and, were told to apply again next year; that eventually their community would be eligible. Then the program terminated automatically and these communities were left in a very desperate situation. I question the wisdom of the termination of that particular program. In my mind it fits very adequately the definition of Civil Defence. Civilian communities are threatened and we often think in our part of the country that there is even a foreign force involved because we have that influx of American tourists who allegedly are often responsible for the misuse of our forests. We think this is real Civil Defence and we regret, we lament, the discontinuance of that particular program whereby our communities could get pumpers.

Mr. Patterson: May I make an observation here, Mr. Chairman? I think your observation is perfectly correct from the point of view of the protection of a northern community against fire under normal circumstances. I would like to say that the Civil Emergency Measures program is dedicated to building a capacity to deal with a war situation, an attack on North America. It has always been agreed that the capacity you build up for a war situation is a capacity that should be used in a peacetime situation if it is available. Nevertheless, when you are talking in terms of developing a capacity for a wartime situation this is where actually you have to take a look at the priorities. Once you start looking at a wartime situation you really have an entirely different type of what you might call "threat" to Canada as a whole and various areas of Canada, et cetera.

Mr. Penner: Thank you, Mr. Chairman.

The Chairman: Mr. Guay.

Mr. Guay (St. Boniface): I would like to ask a supplementary pertaining to those pumpers. Is it the province that dictates the policies pertaining to these pumpers? First of all, I know that they purchase them, probably on your behalf, and then send them out more or less on loan to various area municipalities but they are designed to be used only for training. These pumpers are of no use whatsoever to the municipalities. It is wishful thinking really in some areas, particularly in metropolitan areas, to say that these trucks are benefitting the area municipalities as far as use other than training purposes for Civil Defence is concerned because the area municipalities that have the pumpers will be only more or less storing them for that particular program. Am I correct in making that statement?

Mr. Patterson: This was the purpose in mind when they were purchased, that they were actually training pumpers and not operational pumpers. They were not supposed to be put into a community with the idea of augmenting the capacity of the community to deal with a fire situation. This was not supposed to be the extra pumper they needed to make a good fire-fighting force; this was supposed to be a pumper that could be used by the province or the municipality for the training of fire-fighting volunteers.

Mr. Guay (St. Boniface): My other suggestion certainly will not affect this year's budget but I think possibly consideration should be given to Civil Defence working jointly with

• 1640

area municipalities, especially the metropolitan areas, in a co-operative effort to purchase the pumpers, which are very costly at the moment, through the federal government. You cannot buy a decent pumper for less than \$40,000-odd and you even have to pay both federal and provincial taxes on the purchase price. I know that where I come from people would be very happy to work jointly with Civil Defence and this co-operation would benefit Civil Defence in many, many phases, particularly the maintaining of your machine which otherwise is let in somebody's fire-hall and probably remains there. I have had experience in this, and I feel that such a joint program certainly would result in federal, provincial and municipal savings.

I have had quite a bit of experience since 1956 on civil defence, and I sometimes think that it is a lost cause. It is very difficult to rally people together, even some of those who have taken your training program in Arnprior. They come back to our own areas and you never hear any more about them. They do not even make a report of what they learned. If you ask them how did it go, they will say it was lovely, it was a really fruitful training program. But I have really never seen anything come out of it. And when I say that, it is because I have seen many municipal officials who attended it, and I for one would not attend because I did not think I could do any better than the others. So I did not attend myself. If the others are an example, I felt it was very poor and I wonder sometimes if the money spent was worth it.

This leads me to the other two questions that in part I have already started. Could we get the figures of the money that is given to each of the provinces annually, and also the contributions to municipalities? I am sorry if I am going to Vote 10 for a moment, but it is relevant, Mr. Chairman. The reason I say that is that in these estimates, as in any other part of the budget, we have the heads of Departments sitting here and it is a matter of the members of the Committee making an assessment as to who is the smartest, who can really hit at the right spot to find out where these people might have made a mistake or where they could reduce. Otherwise we are

like a teacher with a class trying to give the kids an exam and saying who is the smartest and who is going to ask the best question. And I think that this is a very, very poor budget, particularly for newcomers to really question these people as to whether the money is well spent, and whether they really need the amount which is indicated in these estimates, even though the amounts may be less than the previous year.

So my question will be to you: Is there any part of this Civil Defence budget, that with your experience and your knowledge, if you were in a private enterprise and we gave you a bonus for reducing the budget, could you in all sincerity say to me that you could find a spot somewhere where you could reduce this budget?

Mr. Patterson: I think you would have to take that right around and you would have to task me, and when you had tasked me then I could actually tell you what the proposition was.

Mr. Forrestall: What do you mean, task you?

Mr. Patterson: In other words, what do you want a civil emergency measures program to do. You have many variations and themes on what you may want a civil emergency measures program to do, and to carry out some schemes would require very large amounts of money. I might say this, that the civil emergency measures budget itself has been reduced from \$12 million in 1966-67 roughly, in 1965-66—I am talking off the top of my head now—to \$10 million to \$7.6 million. We were \$6.5 million last year, and we are \$5

• 1645

million this year. We have been working very hard to ensure that the dollars we had left are put in the most significant areas.

Mr. Guay (St.-Boniface): That I appreciate, Mr. Chairman. I was going to come up with that question, because I felt that the answers were not satisfactory. The first question would be, is there any possibility or a hope that possibly in another year, in any of these votes, particularly the one that we are dealing with, we could have more details instead of the very broad sense of it? We do not really know what we are looking at, whereby we can study it intelligently and come up with intelligent questions. I feel that if the budget was made more comprehensible and

more understandable, particularly to newcomers, possibly we could have a better discussion which would make more sense in benefiting the citizens of Canada.

My next question, Mr. Chairman, to the witness is do you really believe that we are getting worth for the money that we are spending on civil defence?

Mr. Winch: If you say no, you are fired.

Mr. Guay (St. Boniface): I do not know, I think probably I would take my hat off to him.

Mr. Patterson: There is no such thing as a perfect organization, I do not think, because you have many individuals and many programs that are in various stages. But I would like to say one thing that I think would be rather interesting. When I talk to you about civil emergency measures in the Province of Quebec—I just came back from there—you may ask if the program there is worth the money. There are 6 million people in Quebec and last year they got a little better than one-quarter of our money, which would be about \$900,000, say \$1 million. Apart from running a first-class central organization—and when I say first class, I mean that—in those 229 municipalities that were involved, you multiply 229 municipalities by 13 and when you add the department heads, you would have somewhere in the neighbourhood of 26,000 people right there that you do not pay a cent for who actually all have a plan and are all responsible for carrying out a responsible job in an emergency situation. That exists right across Canada, and you are doing it, as far as the Emergency Measures Program itself is concerned, for \$5 million a year.

Do you mind if I change to another subject for a minute? You raised something a short time ago that I think is rather significant. You were referring to the civil emergency measures school, what we now call the Canadian Emergency Measures College at Arnprior.

Mr. Guay (St. Boniface): I did not question it, Mr. Chairman. I have no doubt about your program there, but I question those who have attended.

Mr. Patterson: I was wondering over what period you have seen this, because the program at the College has changed quite significantly.

Mr. Guay (St. Boniface): I know.

Mr. Patterson: At one time it was what you might call a basic rescue school. It developed individuals or teachers to do what you might call an individual rescue job, including first aid, and so on. At the present time it is a staff college. There are doctors, nurses, welfare people, mayors, reeves, counsellors, municipal co-ordinators, provincial co-ordinators, people who actually have responsibilities in every-day life who go there to find out what their role is, and what the total large plan is for civil emergency measures. These people go there and really I would say 90 per cent of the people who arrive there have no support as far as civil emergency measures are concerned outside of the fact that we pay their transportation to the place, feed them for the two to five days that they are there and send them home again. And they go back to assume a responsibility in an emergency situation in a community. I think things are changing, as we have gotten away from what you might call a school to a staff college.

Dr. Arnell: Mr. Guay, this brings us back to something we talked about Thursday night and that is the question of the new form of Estimates. I think, although again it is only the first try at it, that the description given of the Civil Emergency Measures program in fact breaks it down and shows what the five supporting services are. This tends to focus

• 1650

attention on what in fact is incorporated within the program, and I would hope that in another year this new form of estimates will, if anything, present even more information, but this is the trend the estimates are taking in which they will be described on a program basis rather than just sums of money.

Mr. Guay (St. Boniface): Thank you, doctor.

The Chairman: I have Mr. Howard on my list and then Mr. Barrett.

Mr. Howard (Okanagan Boundary): Mr. Chairman, when we heard the testimony from the Hudson Institute during our NATO review there was some discussion about the business of fallout and various levels of protection that were available to a country if proper preparations were made. We even heard estimates of the number of casualties based on the level of protection that was obtained.

Could you tell us, Mr. Patterson, what level of protection we have in Canada today against fallout threats?

Mr. Patterson: If you are talking about what level of planned protection we have, we do not really have what you might call a planned protection program apart from the fact—I think this is extremely important—that in Canada when we completed the fallout shelter survey, working on the basis that for shelter capacity you should have 12 square feet with the protection factor of 10 or better, we have basically 55 million shelter spaces in Canada. Of course, this is what you might call a large term in a way, because this involves all large buildings and it involves all the background material we have done on mines and caves, and so on. Some of these places are not available to you because they are full of coal; some of these places are not available to you because they are big storage equipment depots, and so on. This actually supplies us with the material or it supplies the provinces with the materials by which they can, in each individual community, go out and determine what the fallout shelter capacity is within the community with the idea of developing what you might call a crash action shelter program.

As far as a shelter program as such is concerned—I am talking now, of course, about fallout shelters, I am not talking about protection from fire and I am not talking about protection from the blast, I am talking about fallout shelters only—in Canada in every home that has a full basement with, say, two feet of concrete above the ground and maybe 20 per cent of the wall space for windows, you probably would be about 30 times as well off inside that basement without any other shelter as you would be outside, as long as your house did not catch fire, and so on.

The idea of the fallout shelter program was to do two things. It was, first of all, to give the communities the information concerning the large buildings in their community so that they could start working on a program and could say that in the 10 blocks we have set up for our community the significant buildings are such and such and if we were in a position of tension then we would direct people towards them.

The second thing, of course, is to develop towards this with the idea of providing government with an indication of what the shelter situation is in Canada generally and, after we have analyzed it completely, what steps would be necessary to carry a program to a further stage if it were considered necessary.

To ensure that this program does not get out of date, we actually have funds in this year's estimates for its updating so that any municipal planner who is planning for the crash action shelter program in his community has up to date information on the information of five years ago which in Canada as it is developing today would be probably worse than useless in many places. We deal both with buildings that are going up and buildings that are being torn down so that we have a feeling for the total at all times. Can you make your question more specific?

• 1655

Mr. Howard (Okanagan Boundary): Am I to assume from what you have said that we actually do not have any shelter program at all at the present time, other than a survey of the fact that we do not have any?

Mr. Patterson: No, there is a municipal guide which has been used by the provinces and the municipalities for some years. There is a chapter in the municipal guide on exactly how to use the information with respect to the results of a fallout shelter survey. All the provinces have had print-outs from this fallout shelter survey so that every municipality can have a print-out indicating exactly what buildings have what amount of shelter space, potential shelter space and square footage sort of thing as well as what degree of protection.

Mr. Howard (Okanagan Boundary): I realize you could have a print-out, but do we actually have any space in Canada that is fallout shelter space and is so designated?

Mr. Patterson: That is so marked, no. I should not say that because we do have space for the emergency government headquarters that have been established at the regional level, at the zone level and at the community level. These actually are designated as protected spaces for the carrying out of the government and for the people who—

Mr. Howard (Okanagan Boundary): This would amount to 0.001 per cent of the population that you are protecting.

Mr. Patterson: The Department of Public Works has in the past actually dealt with the situation with respect to the capacity of large buildings being developed by Canada to determine whether or not the position of the building required that there be shelter space in it. I know when I first came on to the

program it was considered that if there were a requirement and if the building were in an area that was threatened, they could make an expenditure to enhance the building in such a way as to increase the fallout shelter space.

Mr. Howard (Okanagan Boundary): Am I to assume, then, from what you have told me that as of today the country is naked and unprotected from the possibility of fallout?

Mr. Patterson: No, I do not think it is fair to say that for another reason entirely that I have not mentioned. One of the most important things in any fallout shelter program or any other emergency preparedness program is an informed public. There are radio tapes and T.V. films available at the present time which are so designed that if we were in a position where things were beginning to heat up and the government felt it was desirable to do so, they actually could inform the public at large of what the impact of a nuclear attack on Canada could be and what the individual should do to protect himself. This information is available not only as radio tapes and as T.V. films, but it also appears in the new edition—of course, it appeared in the old edition, too—of *Eleven Steps to Survival* which we are turning out at the present time. We have not put out this edition in general distribution, but we actually are making available 6 million copies so there will be one copy for every household in Canada.

Mr. Howard (Okanagan Boundary): Mr. Patterson, you have told me all about pieces of paper, you have told me all about radio tapes and films, but you have not told me a thing about a single shelter we have, except for a few at provincial capitals to house government officials. Actually we do not have a single shelter for the civilian population at the present time.

Dr. Arnell: Mr. Howard, this emergency measures program that is included in the Department of National Defence estimates is precisely that, co-ordinating function to try to assist people at all levels of government and particularly out in the provinces and the municipalities to do things for themselves. I do not believe it has ever been conceived that this \$5 million or \$6 million here would provide any of these things. The money is intended to educate people and provide them

•1700

with information to enable them to do it themselves. I think, going back to World War

II, the concept of civil defence in very large measure was to educate people to help them to protect themselves rather than, in effect, have the view that somebody does everything for them. This was something that General Worthington always used to stress so much in the early days when he was in charge of this.

Mr. Guay (St. Boniface): May I ask supplementary question, Mr. Chairman?

The Chairman: Mr. Guay on a supplementary.

Mr. Guay (St. Boniface): If the reason for this is to educate them—and I use the word “them” as meaning the area of municipalities—how can we think we will achieve the appropriate education of the area municipalities if we who are dealing with a budget are not sufficiently educated by you people who come before us and do not even know the details of it. It is not because we are short of thinking; it is because we get very little detail. I hope you will give us more details at that particular level.

I would say to you, however, in all sincerity, that if the idea is to educate the area municipalities I think you are failing very badly, because I know—and certainly I was at school when this was going on in the last 10 years or so—that the program of education to that end and to let area municipalities know what is involved, and all the privileges that may be made available to them, is certainly not communicated properly at that particular level.

I am suggesting that, and I would like to hear your comments on it.

Mr. Chairman, if I am taking the wrong attitude I will just pull right out.

The Chairman: Mr. Guay, I think it is a very important question.

By way of explanation, in the course of our NATO hearings before Easter we received evidence, not from one witness but from several, of the extreme importance of emergency measures organizations. We went to Switzerland and Sweden and got some insight into what they were doing. For example, in both those countries they have requirements that new buildings in certain vital areas be so constructed as to provide appropriate shelter. This can be done at very little additional expense.

All of us in Canada know that our urban areas are growing very rapidly. In Toronto, Montreal, Vancouver and Winnipeg huge new

multi-million dollar buildings are going up and not a cent is apparently being spent on or no thought is being given to, adapting the basements of those buildings for emergency measures.

You have justified this, Mr. Patterson and Dr. Arnell, by saying that you see your program as an educational program, or a helping people to help themselves type of program. I know Mr. Guay has had a great deal of experience at the municipal level and I think it is fair.

Mr. Guay (St. Boniface): I do not claim that it is only my impression, sir. I may have some experience and perhaps I lacked the proper qualification to adapt myself to what their program was, but I feel that we see very little of it at that level. And if it is not the fault of the federal government could it then be because you are leaving this to the provinces. Could it be the province that is failing to communicate? I do not know. I am asking you.

The Chairman: Mr. Guay, correct me if I am wrong, but I think the point you are trying to make is that if this is very basically an educational program directed towards the municipalities then in your experience it is not working. If this is true it is a comment which should be considered very carefully by your organization, Mr. Patterson.

Mr. Guay (St. Boniface): I am not criticizing. I am just asking the question to see what you think.

The Chairman: Mr. Patterson, would you like to comment?

Mr. Patterson: Thank you very much. I know what you are referring to. I might say that the fall-out shelter survey has just been completed and the basic individual material has just gone to the provinces and the municipalities.

We are collating this with several points of view in mind: your shelter situation against the day time population; your shelter situation against the night time population; and the locations of your shelters relative to the threatened areas in Canada.

As a result of all this collation and actual examination and separation into this basic material, we will be in a position, Mr. Chairman, to make an observation about the actual situation of fall-out shelters in Canada. If you ask have we gone beyond this point, the answer is no.

• 1705

In the United States of America they have actually gone beyond this to the point where they have done two or three things. First of all, in many places they have marked the shelter space that has been identified. The shelter space was identified in just exactly the same way as we have been identifying the space here. The marking was done as a result of contracts with various hotel-owners and owners of big department stores, and so on, that had areas that could be used for shelter. They have got to the point of stocking, with water containers, emergency sanitary facilities, first aid kits and basic rations, 92 million shelter spaces in the United States of America. At the present time the program is not being further funded but they have reached that stage.

One of the important things they are doing—and this is one that I have just been talking about—is developing community plans in which they actually say to the people in the community, “You are in area X and the buildings to which you can report for shelter are so and so.”

At the first major conference I attended on civil emergency measures I listened to the mayor of a western United States city who had just finished completing this shelter program. They asked him: “Do you have complete shelter facilities for the population of the city of X?” He said, “No, we have not. All we have done is identify them. But as a result of the number of shelter spaces, we have accommodation for at least 65 per cent of the population, and I feel that the total population should be advised where this accommodation is.” Some of the people would be away, some of them would decide to go some place else, some would be on duty, and some people always stay at home. Therefore, he felt that actually, despite the fact that he had only arrived at identifying his space, he should have a community plan that told them, for their protection, to go to these points.

Mr. Guay (St. Boniface): Mr. Chairman, with your permission, my next question is a supplementary. I have to leave. I have another meeting to attend. My question again relates to communication. First of all, you know your program and you seem to be able to put it across to me, but in my thinking, if you at the federal level are spending the money and handing it out to the provincial government to work out a program on your behalf, are you following it up to see that it

is properly communicated to the areas? Do you go to the municipalities and from them to the citizens themselves, or do you just give the money to the provincial government and that is the end of it?

Mr. Patterson: No; we have spent a good deal of time actually with the provincial people and with the municipal people, whenever possible in company with the provincial people, to see what is happening in the field of civil emergency measures.

In relation to the fall-out shelter program that we are talking about, however, we are just at the stage where follow-up is possible. We have TV tapes that have been prepared...

Mr. Guay (St. Boniface): Mr. Chairman, on a point of order, I just wanted to ask the Doctor whether his Department was following up the money for civil defence that it has allocated to each province, to find out if it is properly spent and whether the program is properly communicated to the municipalities and their citizens. This is what I want to know. I do not want to go into video tapes, or anything else.

In other words, if you are in private business and you are allocating money to several branches surely to goodness you would want to know where the money is and whether or not it is being properly spent.

• 1710

Dr. Arnell: You have your assurance from Mr. Patterson that they follow it up in the field. Also, in answer to the earlier question, some information is being provided for you about the Province of Manitoba relative to just what sort of projects the money goes, and I hope that that will, in fact, tend to answer your question.

Mr. Guay (St. Boniface): Yes, you are right, Doctor.

The Chairman: Mr. Howard, did you finish your question?

Mr. Howard (Okanagan-Boundary): No.

The Chairman: Perhaps we can come back to you then.

Mr. Gibson: I have a supplementary, Mr. Chairman.

The Chairman: I think we had better get back to Mr. Howard. I have your name down on the list, Mr. Gibson.

Mr. Howard (Okanagan-Boundary): We have heard estimates from the Hudson Institute as to the number of casualties that would occur in the United States in the event of a nuclear attack. Could you give us those figures as they apply to Canada?

Mr. Patterson: Let us go back to the question of North America being attacked: is the United States attacked only, or is Canada and the United States attacked? If they are attacked, what centres are attacked?

Mr. Howard (Okanagan-Boundary): Mr. Chairman, surely Mr. Patterson knows the comparable basis on which we are talking. We are talking of the Hudson Institute study on an all-out nuclear attack on the United States, and they gave us estimates of the number of casualties. Surely we have some comparable figure available to CEMO in Canada.

Dr. Arnell: I think the real problem that Mr. Patterson has in answering this question is that with the exception of relatively few either major population centres or military establishments there are not the equivalent sort of targets in Canada.

One of the major target areas in the United States today for a missile attack is, of course, their underground missile silos. These are in remote areas in the United States and an attack on that particular area could have absolutely no effect on Canada if, in fact, the weather conditions are such-and-such. On the other hand, if the weather conditions were quite different and the wind was blowing in the opposite direction, it could, in fact, have a major effect on an area which you would say under normal circumstances would not be likely to have fallout.

So that, in attempting to do the kind of study that the Hudson Institute has done with respect to the United States, there are so many postulates that must be put in as to whether the wind would be a certain way if a certain American target was attacked, that one tends, I think, to limit considerations to such areas as the major metropolis or megalopolis, or whatever you like to call it, along the southern Ontario area through to Montreal as being an area that would get any direct downwind effect from some major American targets or might, in fact, be itself a target.

Really, one of the great difficulties is to relate Canada to a separate target from that of the United States or whether in fact there

are specific Canadian targets where we are really only downwind from an attack against the United States.

Mr. Howard (Okanagan-Boundary): Having made all these suppositions, do you have a...

Mr. Harkness: May I say a word there which I think might help?

The Chairman: Mr. Harkness on a supplementary.

Mr. Harkness: Eight to nine years ago there were extremely detailed charts, which you must still have in your Organization, showing what the effect would be, of a bomb of a certain megatonnage, outside of Toronto, inside of Toronto, outside of Montreal, various distances from it, in the middle of Montreal and the various other larger centres in the country, what the area of destruction would be, and what the fallout effect would be depending on the direction of the wind. There were very detailed and extremely complicated charts which showed all this information that you are talking about, that the Hudson Institute was talking about, as far as Canada is concerned. Do you still have these charts?

• 1715

Dr. Arnell: I think one of the problems here, Mr. Harkness, is that those charts of 10 years ago were essentially in respect of fission bombs where almost the total energy, in fact, produced radioactive fallout, so that it made no difference whether they were exploded at altitude or on the ground.

Mr. Harkness: Oh, yes.

Dr. Arnell: You could depend on that. In fact, as you yourself said, they were bombs. Moving into the missile with the thermonuclear warhead, the amount of actual fission product produced is very much reduced, and it depends in large measure on the altitude at which the thing is burst as to whether it comes in contact with the ground as to whether in fact you...

Mr. Harkness: I think Dr. Arnell will confirm that these charts show the effect of a ground burst, an air burst at a certain distance, another air burst higher up, and so forth. In other words, this material is available to a large extent.

Dr. Arnell: I would suggest the targets have changed. I agree there are such charts, but there is no simple answer. That is all I was trying to say.

Mr. Patterson: If North America were attacked, it is very difficult to say X number of people would die. What I was trying to say was, are they going to attack population centres or are they not? Are they going to attack Canadian population or are they not?

We did a study recently and we got what was called a plausible attack. A plausible attack is just one of many attacks. I cannot quote the exact figures this plausible attack today because I was not expecting it, but I would like to give each member a copy of this plausible attack.

The Chairman: Could we agree that this be supplied and made an appendix to the minutes of our hearing today?

Mr. Patterson: All I was going to say was that this is a plausible attack, and only under one situation with a certain amount of megatonnage on certain targets.

Mr. Howard (Okanagan Boundary): But you do not have any actual figures for the whole of Canada?

Mr. Patterson: Yes. This is a plausible attack on the whole of Canada using population centres as...

Mr. Howard (Okanagan Boundary): What are those figures?

Mr. Patterson: As I said, I cannot give you the exact figures. I wish I could quote it exactly here, but I do not want to make an inaccurate quote.

Mr. Howard (Okanagan Boundary): Following on what Mr. Wahn mentioned about shelters in buildings being constructed, you have no program of this kind in Canada at the present time?

Mr. Patterson: No.

Mr. Howard (Okanagan Boundary): It seems to me, Mr. Chairman, that the whole program we have had outlined to us today is a pretty Mickey Mouse operation in terms of what we as a committee have learned is valuable as a nuclear deterrent and that if our nuclear deterrent is to have any effect we will have to follow it through with a civil defence organization that has some teeth in it. It would

seem to me, from the kind of answers that we have had today that we do not have that kind of deterrent in Canada.

The Chairman: Mr. Barrett.

Mr. Barrett: Mr. Chairman I would like to go back for a moment to the hospitals mentioned by Mr. Harkness. Mr. Patterson, you indicated that they were deployed—or the word used was “deployed”—to various provinces or areas on request. Who would request a hospital for Viet Nam? I understood from the answers that there is one out of the country.

Mr. Harkness: The Department of External Affairs really supplied these as part of our external aid program.

Mr. Patterson: That is right.

Mr. Barrett: In other words, assuming we had 18 available, X number were not here because we did not have an emergency problem, so we allowed a few to go out of the country.

Along similar lines, when we are talking about this reduction in the amount of money to be spent by the federal government, and I would assume a smaller amount by the provinces, and I would assume also because of lack of interest in municipalities, do I take it that there is less interest in civil defence or that they are so extremely efficient they do not need this participation any more? Which of the two would you suggest?

Mr. Patterson: As I said earlier, if you are going to carry out any program somebody has to determine what the program is going to be, what it is going to cost, and so on.

• 1720

Mr. Barrett: For this program covered by these estimates, you projected something in your mind after contact with the people of the provinces, or you gathered in a little group amongst yourselves and decided that this amount of money was sufficient. You also indicated, if I am not mistaken, that less people were needed in the regions. In fact, in the area that I am acquainted with there was an emergency measures man in charge and he had a second-in-command. When he retired they just left the second-in-command in charge; therefore, they reduced it. For what reason, lack of interest or lack of need?

Mr. Patterson: This was in Northern Ontario. It was lack of resources.

Mr. Barrett: No, this particular situation was in Southern Ontario.

Mr. Patterson: There have been several people that were co-ordinators that have been replaced as they retired by their deputies or by other people and there has been a reduction in the number of people involved in civilian emergency measures. This is a budgetary problem.

Mr. Barrett: Because of the lack of need? Because they are so efficient?

Mr. Patterson: No, because of the lack of money available at the present time.

Dr. Arnell: I think Mr. Patterson is really just raising the point that in the plans of provinces and municipalities this has to take lower priority than other things for their available funds.

Mr. Barrett: I will accept that situation, but I think the point that was made is that there is a vast country and we are just taking an attitude that if a bomb drops in Ottawa, for instance, Vancouver will carry on for Canada. If they happen to hit Vancouver and Ottawa, then the people in Saskatchewan will inherit the earth. Possibly they would like it; I do not know—I am assuming this. Is that the philosophy?

Mr. Patterson: Mr. Chairman, could I recap for a minute?

The Chairman: Yes, please, Mr. Patterson.

Mr. Patterson: I would like to go back to recapitulate for a minute. There are other people besides ourselves in the emergency measures field. There are 17 other associated departments; National Health and Welfare, Public Works, Justice and so on. The total expenditure in civil emergency measures is probably about \$14 million federally—I say probably. It is hard to estimate when you consider the number of people that are working half time that are not budgeted against it, you know, but it is around \$14 million.

This means, as I said before, that the federal government has not backed down on its emergency communications across Canada. It has continued to maintain its warning system across Canada; it has continued to maintain its emergency government headquarters, both the permanent emergency government headquarters and the interim headquarters, and it continues to maintain planning staffs in every one of the departments I am referring to.

You asked the question, is this program adequate? With \$5 million at the present time we can do this: We can carry out the necessary planning and preparation from the plan point of view at the federal level, and we can do certain studies and up-date fallout shelter surveys, and things like this. We can also subsidize provinces and municipalities to do the same thing; in other words, there are alterations and maintenance that have to be done at various government headquarters across Canada. But if you say, can we go ahead and complete the regional zone municipal communications program across Canada, can we carry out an emergency government headquarters system with the \$5 million and other capital construction and capital purchase items, we cannot on \$5 million and this is the situation.

As I say we can plan, we can make all these preparations concerning information, we can get studies done, and so on, but this is where we stop.

Mr. Barrett: I would like to make one comment and I may be in error, but I am looking forward to seeing the new facts and figures that you are presenting in relation to your philosophy concerning the new type bomb that will have less radioactive effect on people regardless of where it explodes in the air, or dissipates and that sort of thing. If I am not mistaken, Mr. Patterson, you made the comment that if I had a basement and there was not too much window space in the basement room and I had X number feet of concrete around me I would be 30 per cent better in that than out of it.

• 1725

Mr. Patterson: I did not say 30 per cent; I said 30 times, probably. This is a rough term. In some basements you could be 40 times as safe. I am talking about the protection factor here and the protection factor really means that you are protecting yourself at this point from radiation. Now, if you have 40 units of radiation coming to the outside of your basement and you have a protection factor of 40, there is one unit of radiation that actually reaches the inside of the basement.

Mr. Barrett: Thank you.

The Chairman: For the information of the Committee, a number of members who are interested in Vote 15 have had to leave for other meetings, so we plan to finish, if we can, before 6 o'clock the votes relating to the

Emergency Measures Organization which we are now on, and then continue the Vote 15 after the dinner break—in other words, at 8 o'clock tonight. I have Mr. Gibson.

Mr. Gibson: Sir, in connection with Mr. Guay's question about whether you follow up the spending of money by provinces and municipalities I believe your answer was that there is a follow-up in the field. Well, that phrase does not satisfy me, sir, and I would like to know the nature of the follow-up plan; how many employees are employed in the follow-up plan; whether they are specialists in following up or whether they are doing it in relation to other work; whether they cross the country simultaneously, that is, one task group in each province going out and doing follow-up, or whether one man or two or three men cross Canada over a period; what is the period and when the last follow-up was made.

Mr. Patterson: May I start at the beginning? Each province at the beginning of each year submits a project, as I said, and this project is based on what the municipalities and the province intend to do. They submit this to the federal government and the federal government says, we can support this to such and such an extent.

The follow-ups are three-fold. First, of all, there is an audit. In other words, is the money actually being spent for the purpose for which it was allocated in the first place, and it is quite specific as to how it is allocated.

Second, there is what you might call an almost constant follow-up in this respect. We have a conference once a year of federal and provincial people from the field—these are the co-ordinators and our regional directors—with the idea of talking about what has been done, what should be done, where we should be going, trying to get some picture of what is going on, and where we are going.

Beyond that, I and my senior directors endeavour to cover as many provinces as possible at least once a year and in some places more often, if possible, actually to see the situation in the field and to discuss the situation personally.

Last, and I think this is the most important, in 1968 when the government authorized these changes in funding they also authorized the Canada Emergency Measures Organization to do two things: to consult with departments and provinces on priorities, and they

required them to do this, and second, to set up an evaluation program.

We actually have two groups now, one called a program planning and budget group that will make a sweep across Canada every year starting this year with the specific idea of going to every province and saying, "These are the priorities that have been established generally federally, this is the situation today; what are you actually going to do in the province this year?" and coming to some common conclusion about what that province will do that year. The project will be submitted on the basis of this discussion, and this is this business of getting the priorities and allocation of funds.

Then we have an evaluation group whose responsibility first of all is to determine where we are at the present time...

• 1730

Mr. Gibson: I am sorry to interrupt you. Is this something new?

Mr. Patterson: Yes.

Mr. Gibson: Is this evaluation group a new one, too?

Mr. Patterson: Yes, the evaluation group is a new one, too. We carried out a study starting in January of 1968 and this study actually took a look at the program, found out how many activities are involved in the program and what activities actually had to be carried out to give us an effective capacity across Canada to do the things that a civil emergency measures program should do. As I say, to go back to what the government said, we are now using this as a plan of evaluation. We know what we are trying to do and we know what we want to do. We will know from these program planning and budgeting people what they intend to do during the year; then we can determine at the end of the year whether or not that situation has been met and if there is a shortfall, what has to be done to push it up.

Mr. Gibson: I will not name any particular place because this is on record, but supposing you went to a town in Ontario and found they were using the funds that the province had given them for this purpose for recreational sports. What would happen within the Department in that event? Would it go to the Minister? How would that be dealt with?

Mr. Patterson: Would I myself find...

Mr. Gibson: For instance you are investigating and you find that, say, \$30,000 has been misappropriated and used on welfare or sports or something like that instead of on defence. What would you do?

Mr. Patterson: First of all I would telephone my counterpart in the Province of Ontario and tell him what I had observed and then let him look at the situation. He might at that point just say that somebody had to refund the \$30,000; but it is his responsibility in the first place. This is a municipal activity and is not the responsibility on the federal government. If, however, the situation continued as such...

Mr. Gibson: This is a real problem, I think.

Mr. Patterson: Yes. Then what you would do is to inform the auditor of what you saw at such and such a point and ask him to investigate the situation when he is looking at the expenditures on the project.

Mr. Gibson: Thank you very much.

The Chairman: Are there any other questions? Mr. Allmand.

Mr. Allmand: I just have a few short ones. If they were asked before I came in, Mr. Chairman, let me know and I will withdraw them. I would like to know under what vote the EMO magazine falls.

Mr. Patterson: It is under Information.

Dr. Arnell: It is the Information line at the bottom of page 240, the fourth one down under Vote 7.

Mr. Allmand: Yes I see—\$68,000. I would like to know to whom you send that magazine free of charge—or is it completely free of charge?

Mr. Patterson: It is a gratis magazine.

Mr. Allmand: To whom do you send it?

Mr. Patterson: To all the provincial coordinators and all paid staff of the provinces and the municipalities. It is sent to all the federal government departments and all the people involved in civil emergency planning. There are other people, of course, who are unpaid but who still have emergency planning responsibilities. This is what you might call our method of keeping them abreast of what is going on, basically, not only on a

Canadian but also on a North American and world-wide basis in civil emergency measures.

Mr. Allmand: It is distributed down to the municipal level?

Mr. Patterson: That is right.

Mr. Allmand: Therefore, the municipalities that Mr. Guay has been with would receive that magazine?

Mr. Patterson: That is right.

Mr. Allmand: I presume that it is distributed to all civil protection employees in municipalities as well as in the provincial field. How many copies are there in all?

Mr. Patterson: I would have to enquire, Mr. Chairman. I will get the number of copies.

Dr. Arnell: Could we give it to the Clerk to have it included in the minutes?

The Chairman: Yes.

Mr. Allmand: Is it printed in French as well as in English and distributed to the French-speaking areas of Canada?

Mr. Patterson: Yes. That is right.

Mr. Allmand: Thank you.

The Chairman: Are there any further questions? Mr. Howard.

Mr. Howard (Okanagan Boundary): Mr. Patterson, could you tell us your background and training prior to taking on the job as head of the Canada Emergency Measures Organization?

• 1735

Mr. Patterson: Certainly.

Mr. Howard (Okanagan Boundary): And your subsequent training in the subject of emergency measures?

Mr. Patterson: How far back do you want me to go? I am a graduate from the University of Alberta originally. I was teaching high school before the Second World War and then I was in the Canadian Armed Forces for a period of about two and a half years. I came back and served with the Department of Veterans Affairs as an occupational counsellor in connection with university education for a period of a year, after which I went to the Civil Service Commission of Canada where I

was the Regional Director for the Civil Service Commission of Canada in the province of Alberta, the Northwest Territories and the Yukon, working out of Edmonton. I came from there to Ottawa in 1952 as a senior selection officer—they called them in those days—and then became the Assistant Director of Personnel Selection. Shortly afterwards, because of the illness of my immediate chief, I became the Acting Director of Personnel Selection. The Civil Service Commission had a change at that time in which they grouped both the personnel selection function and the classification function into one group and I was then responsible for operations. I was called the Director of Operations, with the responsibility for the recruiting and staffing of the Civil Service of Canada as well as the classification of positions. At that point I was transferred to the Canada Emergency Measures Organization basically on the basis of the fact that I had, as a result of my experience with the Civil Service Commission, a very broad background of total departmental activity, as the Civil Service Commission deals with all government departments and appreciates their intricacies and so on. Because of my appreciation of the governmental situation I was transferred to the Canada Emergency Measures Organization. Since I have been on the Canada Emergency Measures Organization, what you do, of course, once you are on this job is that you more or less eat, live and sleep it almost from the time you begin.

As you probably know, we are associated in arrangements with the United States—I should not say arrangements—the development of plans that are what you might call mutually desirable. In other words, we do not want one system of warning on one side of the river at Windsor and another system of warning on the other. I also deal with the problems of Canada with respect to its NATO association in the civil emergency planning field. Again as you may know, Canada is involved in five of the eight wartime agencies of NATO and I am the Canadian representative on a senior committee on emergency plans. Basically, that is it.

Mr. Howard (Okanagan Boundary): Have you had staff training at a military staff college, for instance, or any specific military training other than...

Mr. Patterson: No. I have never been to a staff college.

Mr. Howard (Okanagan Boundary): Were you a commissioned officer?

Mr. Patterson: Yes.

Mr. Howard (Okanagan Boundary): What type of work did you do in the military forces?

Mr. Patterson: I was an armoured corps officer. As I had been a school teacher before I went in, whenever I got through a course I would end up either as an administrative officer again or as a training officer. And so I went through OTC into the instructional field, into the admin. field, in the driving and maintenance training, went overseas, finished my training over there and then was picked up and put in the Selection of Personnel Unit of No. 3 C.A.C.R.U. at that time.

Mr. Howard (Okanagan Boundary): Your work has been mostly administrative rather than technical?

Mr. Patterson: That is hardly fair because actually I have a very keen appreciation of science and its implications. In fact I had a background of biology and chemistry at university and I have never dropped my interest in these fields ever since I left the university. So actually, if you talk about the field of twentieth century warfare and its implications for the individual as far as Canada is concerned, from the scientific point of view there is not a great deal that I cannot talk to you about.

Mr. Howard (Okanagan Boundary): Thank you very much.

The Chairman: Are there any other questions by members? If not, may I direct three short questions either to you, Dr. Arnell, or to Mr. Patterson? Have you any reason to believe that any Canadian areas or cities are, in fact, targeted by the...

Dr. Arnell: No, I do not think there is any reason to believe that at all, other than this speculation of the total target of North America.

The Chairman: Have you in fact considered the desirability of requiring that new construction make provision for shelters and, if so, what decision was made?

Mr. Patterson: This situation has never been put to the government by myself since I

came to the Canada Emergency Measures Organization. I might say what the American experience has been.

Dr. Arnell: I think the real question here is that the Chairman asked what has happened in the Canadian one. I guess it has never really come up from the co-ordination point of view, has it?

Mr. Patterson: No, outside the implications with respect to public buildings. Mind you, it was agreed, when the fall-out shelter survey started that no action would be taken until such a time as we knew what the situation was.

The Chairman: That was my third question. I think you mentioned that you are now in the course of carrying out this shelter survey. When will that be completed?

Mr. Patterson: That should be completed, from the point of view of collation, within the next few months.

The Chairman: I see. Do any members have any other questions? We are dealing with Emergency Measures Organization Votes 7, 10 and 12. If there are no further questions on those we will stand the actual passage of those votes until later. We will adjourn until 8 o'clock this evening in the same room, when we will go on to Votes 15 and 20.

Thank you very much, gentlemen.

EVENING SITTING

Monday, April 21, 1969

• 2006

The Chairman: Gentlemen, I believe this afternoon we completed the votes under the Emergency Measures Organization, Votes 7, 10 and 12. We stood the actual passage of them. Possibly now we could go on to the votes under the heading Defence Services which are votes 15 and 20. I will call them individually, but again if you agree, we will perhaps discuss both of them together as they do relate to the same general subject. Accordingly I will now call votes 15 and 20.

DEPARTMENT OF NATIONAL DEFENCE

Defence Services

- 15 Administration, Operation and Maintenance and Construction or Acquisition of Buildings, Works, Land and Major

Equipment and Development for the Canadian Forces including payments to Provinces or Municipalities as contributions towards construction done by those bodies \$1,541,006,000

Defence Services

- 20 Transitional Grant to the Province of New Brunswick in respect of the Town of Oromocto \$700,000

The Chairman: Mr. Winch, I believe you have questions on vote 15.

Mr. Winch: Mr. Chairman, I hope that both you and all members of the Committee have noted that in the last two meetings of this Committee I have been very quiet. I was quiet, sir, because I hoped and anticipated that under Item 15 I might be allowed to ask four questions and hear comments on them by the members who are appearing to assist us.

First of all, Mr. Chairman, I would like to deal with what is obviously the largest amount in the estimates of the Department; I refer to the pay of the military personnel. It will be noted, Mr. Chairman, that it is anticipated in this fiscal year that the total military personnel of the regular force will be 98,238. The military pay allocated is \$701,589,000. There is also the federal contribution to superannuation and the Canada Pension Plan in the amount of \$195,720,764, making a total of \$897,309,764.

Mr. Chairman, I found it somewhat difficult, although I am a strong believer in good pay for our armed forces, to relate \$897-odd million to the number of our armed forces; namely, 98,238, and to relate almost \$900 million to our total defence expenditure. I have tried, sir, to find the reason for this and it is because of my study that I have certain comments.

In the information given us in the white section we find that with 98,238 military personnel for this year there are 106 with the

• 2010

rank Brigadier General and over, for a total armed forces establishment of all three forces of less than 100,000. I believe, sir, that some comment should be made on this and I think it would be interesting to our Committee to know how many of the rank of Brigadier General and higher are stationed at CFHQ here in Ottawa. May I follow through with a

breakdown? I also find, according to the information supplied to us, that there are 16,297 commissioned officers. This works out to one commissioned officer in our armed forces to five other ranks from private to chief warrant officer. It is interesting to note that we have 58,076 non-commissioned officers; that is, from the rank of corporal to chief warrant officer. This works out that we have in our armed forces 74,373 non-commissioned and commissioned officers for 23,865 privates.

Relating the costs of salaries and soon of 98,238, we have 106 brigadier generals and higher, we have one officer to five all other ranks, we have 58,076 commissioned and non-commissioned officers to 23,865 privates.

I think you will understand, sir, why I am asking for a comment on what I maintain is an extraordinary balance situation.

Dr. Arnell: First of all, Mr. Winch, I would like to start at the bottom, if I might, and comment on the corporals. As part of the restructuring of the military establishment and the development of the new pay fields for tradesmen corporal really became the rank of the trained serviceman with a minimum term of between four and five years service. So that, in effect, the serving man in the old sense is a combination of the corporal and the private.

Mr. Winch: The corporals are 35,215.

Dr. Arnell: So that you end up with approximately 60,000 who are trained and men on their way to becoming the trained service man. Within the corporals there are a limited number of what are called master corporals who are at the first stage of command, if you like, in the old sense of the corporal, in the sections in a platoon. So that accepting that the corporal represents the mark of the trained serviceman, your figure on the total of corporals and above as being the NCO's tends to be misleading in the sense of the junior command. It should, in fact, be the warrant officers and the sergeants and the few master corporals who become the non commissioned command levels...

Mr. Winch: You mean a corporal is no longer an NCO?

• 2015

Dr. Arnell: No. A master corporal is an NCO and there are only relatively few of those.

Mr. Gibson: Is a corporal like a private first class in the American Army.

Dr. Arnell: It is the trained service man today and he has to have between four and five years of training and service before he gets his corporal stripes but...

Mr. Winch: I understand that. Will you explain, then, one officer to five other ranks up to the chief warrant officer?

Dr. Arnell: One of the difficulties of explaining this particular rank structure is that included in it are a number of ranks which we call Part II Establishment. These are, in fact, military personnel at least 50 per cent of whom are officers seconded to other departments and, in fact, are not paid for out of our own estimates. These people fill a number of needs in a wide variety of things. You will find one such officer working in the Privy Council office and a number in External Affairs and this type of thing, in addition to a number of officers who are with the Defence Research Board and carried as members of their staff and paid for them. Such rank is not, in fact, part of the military rank but we have shown it—at least a paid military rank for purposes of this Vote 15. This group of officers for the most part are included.

Mr. Winch: But they are part of your establishment of the military personnel regular force?

Dr. Arnell: But they are not in fact part of the, if you like, authorized military establishment for military purposes. They are paid for outside this vote, and when they are not required for whatever job they are doing outside the military organization, that position ceases to exist.

Mr. Winch: Can you, then, explain to the Committee, if they carry a rank in the armed forces and are shown under your regular force personnel, what they are doing under your estimates?

Dr. Arnell: Now that you come back at me, Mr. Winch, I think I have misled you. I realize now the seconded 207 are the ones I am talking about, and you are quite right...

Mr. Winch: I am going on those that which are straight military service.

Dr. Arnell: You are right.

Mr. Winch: And that is 16,297, which is one to five.

Dr. Arnell: Yes, sir. This rank structure is in the process of being "run down"—and that is probably the best word—from the rank structure which was authorized in 1964 as being the target at which the military establishment was to aim when the military establishment was at the level of 110,000. With the run down over the years we have been gradually running down, but included in this rank structure are, in fact, the officers on retirement leave, because the 98,000 includes the terminal leave people. You will see the footnote: "(a) Included in figures showing distribution by Rank".

The difference between the two columns, which you see under 1969-70, of the Total man-years Authorized and the Allowable Continuing Employees does give you a mea-

• 2020

sure of the number of people in the different ranks who are estimated to be on retirement leave during the year.

Mr. Winch: Is that included in the second column?

Dr. Arnell: No. The second column is the Active Force.

Mr. Winch: That is exactly what I quoted from.

Dr. Arnell: Is that the column you are using? I thought you were using the first column.

Mr. Winch: No, I am using the second column which is your employees until 1970. All my figures are based on the second column.

Dr. Arnell: I thought you were speaking to the first column because there was no...

Mr. Winch: No, I am sorry, sir.

Dr. Arnell: Very well.

Mr. Winch: I am speaking only of the second column.

Dr. Arnell: We are dealing with the numbers 1, 7, 24, and 74 in the second column.

Mr. Winch: That is right.

Dr. Arnell: Of those figures 1, 7, 24 and 74, to answer your one question, in CFHQ there is one general, four lieutenant generals, ten major generals and 32 brigadier generals.

Mr. Winch: That adds up to what?

Dr. Arnell: Forty-seven.

Mr. Winch: Out of 106 there are 47 at NDHQ. Is that correct?

Dr. Arnell: Yes.

Mr. Winch: I am sorry to labour this, but can you comment on 106 people of this rank for an active force of 98,000. Can you also comment—I am sorry if I do not have it right—on one commissioned officer to every five other ranks?

Dr. Arnell: Included in this are quite a number of what I think in a civilian sense one would call the professionals, rather than the operational servicemen. For example, within this rank structure there are over 500 doctors, 233 chaplains and 155 dentists, to give you some figures. Also included in the rank structure are the information services people. They are not paid out of Vote 15 but the total rank structure is carried here.

Mr. Winch: May I ask, sir, what military staff you have at NDHQ?

Dr. Arnell: The total military staff?

Mr. Winch: The total military staff at NDHQ?

Dr. Arnell: I can get it for you in just a second.

Mr. Winch: And the total civilian staff at NDHQ. You will notice, Dr. Arnell, I have only been using the straight military figures in the second column. It sounds to me like the Mexican Army, which used to have one general for every 27 men. We are getting pretty close to that here, are we not?

Dr. Arnell: One of the reasons, of course, is that you tend. . .

Mr. Winch: And also because of this very heavy officer staff—one to five—we have a military payroll of \$701 million for 98,000 men.

Mr. Harkness: Will you permit a supplementary, Mr. Winch?

The Chairman: I think we had better wait until Dr. Arnell answers the question which

has been asked and then perhaps Mr. Winch would permit a supplementary.

Mr. Winch: Yes, I would be pleased to, because I want to go on from that to the others.

Mr. Harkness: Mr. Chairman, while this is being looked up—I came in late, for which I apologize—in what manner are we attacking this very large estimate of \$1.5 billion, which is the largest of all the estimates?

Mr. Winch: I have four questions.

The Chairman: We started on Votes 15 and 20. I called them individually but we are dealing with them together under the heading of Defence Services in the Blue Book. It is Vote 10 in the new form of estimates. Mr. Winch led the meeting off with some questions with regard to the pay scale.

Mr. Harkness: I was referring to Vote 15, which is in an amount better than \$1.5 billion. I was just asking for clarification on how we are attacking this or dealing with it.

The Chairman: I believe Mr. Winch gave some prior thought to questions under this heading and he started off, so we will just take the members as they indicate their wish to ask questions.

• 2025

Mr. Harkness: In other words, we are going to jump from personnel to equipment, and so on and so forth.

Mr. Winch: I was hoping, sir, that I could ask the four questions I had in mind, and there will be supplementaries on them, because I have not said a word for two meetings.

Mr. Harkness: I came in late and I am just asking for information on how we are going to deal with this really extraordinarily large item.

The Chairman: Perhaps there is a better way of dealing with it. If it is the wish of the Committee, we could split it up between personnel and equipment. I called the items and I was just going to take the members as they came along on either personnel or equipment. If it is considered that it would be easier to handle it in some other way, this would be . . .

Mr. Harkness: I would suggest that perhaps it would be better to deal with personnel first

and equipment afterwards, or the reverse. I do not care.

The Chairman: As we started with personnel, would it be satisfactory if the questions were directed to personnel first and then to equipment?

Mr. Winch: My first question, sir, was on personnel. My next three questions are on equipment and maintenance and perhaps I could start that afterwards.

The Chairman: Yes, when we finish with personnel. In other words, permit supplementaries on personnel first.

Mr. Winch: And then my other three questions have to do with equipment and maintenance.

Mr. Harkness: I would like to make it clear, Mr. Winch, that I am not trying to interfere with your form of questioning at all. I just wanted to find out how we were going to deal with this in a reasonable manner because it is an enormous item, as everybody realizes, and I think we should have some definite means of procedure.

The Chairman: It appears to me that it would make good sense if we exhausted the questions on personnel first and then went on to equipment, if that is agreeable to everyone. Dr. Arnell?

Dr. Arnell: To answer your question regarding CFHQ, Mr. Winch, there are approximately 3,100 military personnel at CFHQ, of which 1,800 are officers.

Mr. Winch: Of which 1,800 are officers?

Dr. Arnell: And there are about 3,400 civilians. I should point out that within the last year, as I mentioned when I appeared before you in November, as a field command Materiel Command was in fact brought into CFHQ in order to do some double tasking of personnel, and if I...

Mr. Winch: You say there are 1,800 officers at CFHQ?

Dr. Arnell: And this includes what used to be called Materiel Command, which had its headquarters at Rockcliffe.

Mr. Winch: Of these 1,800 officers how many are on Materiel Command?

Dr. Arnell: I am not sure we could give you that information tonight because it has been completely integrated.

Mr. Harkness: Could you tell us how many were on Materiel Command last year?

Dr. Arnell: I am told it is in the order of about 400.

Mr. Winch: That still leaves 1,400 other officers out of the 3,100 military personnel at command, and in addition you have 3,400 civilians.

Dr. Arnell: Of course, a lot of those civilians are also in Materiel Command.

Mr. Winch: When you said 400, that was not just the officers?

Dr. Arnell: Those were the military officers that had been in Materiel Command that are now part of the 1,800 officers shown as being part of CFHQ.

Mr. Winch: On other words,—I just want to get this clear—that means you now have 6,500 military and civilian personnel at NDHQ.

Dr. Arnell: Yes, sir.

Mr. Winch: That means that 3,100 of the 98,000 military personnel are at NDHQ.

Dr. Arnell: And in effect it handles the major logistics job within the whole military function. The Materiel Command headquarters organization, which was at Rockcliffe, did all the procurement of re-supply and this sort of thing, and it has now been brought into Canadian Forces Headquarters.

Mr. Winch: And of the 1,800 officers at NDHQ, 47 hold the rank of brigadier general or higher?

Dr. Arnell: Yes, sir.

The Chairman: Mr. Gibson and Mr. Guay on supplementaries.

Mr. Gibson: Is it not true that because it is a peacetime force you are well advised to have a large cadre of officers and NCOs which can expand in case of trouble? Is that

• 2030

not one of the main reasons for having a relatively larger number of senior officers and NCOs than...

Dr. Arnell: With reference to the headquarters organizational structure, which was in fact the original headquarters structure that was set up following the establishment of the integrated headquarters at the time the total

force was over 110,000, it has only been in the last year or so that it was recognized that the decrease in the entire manpower of the Department was going to be a continuing thing, that in fact steps are now in hand to reduce the officer strength. About a year ago, a planned reduction in officer strength was undertaken; a reduction planned in the way that promotional opportunities would be left within the officer establishment, but, in fact, the promotion policy would be that only one vacancy out of every two would have a promotion into it. As a result, there has been a reduction in officer strength of about 1,200 in the last twelve months.

Mr. Harkness: You mean these are people who actually left the service?

Dr. Arnell: As people retired for any reason from voluntary to compulsory retirement, there has been a policy that only one out of every two vacancies in the ranks up to Colonel were in fact filled. Related to Mr. Gibson's remarks are the top four ranks, largely the headquarters establishment, all the command positions in the field, and quite a number of officers who serve at NATO and in the NORAD headquarters and so on. These upper ranks have been, in fact, left more or less the way they were for about the last four years.

The Chairman: Mr. Guay on a supplementary? This would relate to the high proportion of officers, would it Mr. Guay?

Mr. Guay: Yes. My question is somewhat similar to that of Mr. Gibson. Is it not the case that you probably have certain initiatives whereby an officer will pass certain examinations and qualify for promotions to a higher rank? As Mr. Gibson also mentioned, could it be that, in view of the fact this is a peacetime force, you are keeping on hand the most qualified personnel you can retain; so, in case an emergency occurs, you will then have experienced men along with the appropriate ranks to facilitate carrying out your task. Is this the case?

Dr. Arnell: Yes, in a certain measure it is. I might cite an example of the sort of thing that results in this large number of officers in CFHQ. Within the Technical Services Branch of CFHQ are found all the engineering specialists who, in fact, have responsibility for the capital equipment program. Essentially in the way they were programmed, these programs have been continuing during a period when

• 2035

there has been a reduction of forces elsewhere; so the requirement for technical officers in certain areas over the last two or three years has really been going up rather than down, even though the establishment has tended to be held constant. In defence of these 1,400-odd officers within CFHQ, I must point out that I identified what had been the Materiel Command headquarters structure which included a lot of specialists both technical and on the logistic side; however, the largest of our headquarters branches before Materiel Command was incorporated with headquarters, was, in fact, the Technical Services Branch. It now reflects collectively both the old Materiel Command function, all the technical service staff for new capital equipment as well as a large measure of the research and development activity. This technical services headquarters establishment is close to 1,000 and is being manned at the present time with about 860 officers. The 1,400 would include the Materiel Command; so roughly half of all the officers shown, who I said were in CFHQ, are, in fact, technical experts or logistics experts of one type or another. If you add to that...are the doctors all carried in CFHQ?

A witness: No.

Dr. Arnell: No. I was going to say, "If you add a lot of the specialists". We do, in fact, have within this group the Judge Advocate General's staff, all fairly senior officers who are legal experts. All our legal experts are in uniform. Also included is the Surgeon General's headquarters staff and he is a Major General. Then there is the dental headquarters and the Chaplains; the Chaplains have a Major General and the dentists have a Brigadier General. Quite a number of these higher ranks are assigned to the professional in the civilian sense. I am just reminded there is another one which I meant to mention earlier. The military attachés scattered around the world are carried as part of the headquarters staff, too.

Mr. Guay (St. Boniface): What is the percentage of commissioned officers to soldiers both in Cyprus and in Germany? In Germany, I believe you have somewhere close to 36,000 men. What is the percentage of officers there?

Dr. Arnell: In the two forces in Germany, the ratios will be quite different. One of the

big differences between the operational groups is that the bulk of our air crew, certainly our pilots, are all officers. This gives us some 4,000-odd officers who are, in fact, air crew. On the other hand in an army, or a battalion, as you know, the ratios are...

Mr. Winch: It must be that in the field there is a vast difference in the ratio of officers to men. In headquarters, you have one officer to less than two other ranks.

Dr. Arnell: On a quick check, the Air Division ratio is one officer to six other ranks; the brigade is one to about eleven.

• 2040

Mr. Winch: Whereas at headquarters it is 18 officers to 31 other ranks.

Dr. Arnell: Of course the fact is that CFHQ is not really a place where you tend to have other ranks. You will find in Air Division that there is a total of five civilians all told out of 4,000. On the other hand at CFHQ, as I noted earlier, there are 3,400 civilians. In fact, a very large measure of the supporting staff at CFHQ, the file clerks, stenographers and so on tend to be civilians. There are, of course, a limited number of senior NCOs around headquarters, but generally speaking there are not many other ranks proportionately in CFHQ compared to what you would have in a field command.

Mr. Guay (St. Boniface): Mr. Chairman, did you indicate to me or to us that the other section of civilian personnel was to be discussed later?

The Chairman: We are on supplementaries dealing with officers at the moment, Mr. Guay. We are dealing with the more general questions of personnel, so I will put your name down to raise questions later about civilian personnel. Mr. Howard, did your question relate to the higher percentage of officer strength?

Mr. Howard (Okanagan Boundary): Yes.

The Chairman: All right, Mr. Howard.

Mr. Howard (Okanagan Boundary): Mr. Chairman, when we had our review of the NATO situation, we also reviewed the fact that we have a permanent force that is a professional body and we compared it with our military forces before World War II where we had a small number of people involved, many of whom were officers, with

the idea that in the event of hostilities this trained cadre would be in the position of being able to expand quickly and to train other people to develop a civilian army. However, we were told in our NATO studies that this was no longer practical and that military events being what we expect them to be, there would be no time to train an army. We would have to depend upon the military forces we have on hand at the time that war started and this was the justification for a very expensive highly trained professional force.

Tonight you have told us that we have a lot of officers in our military forces because we need a trained cadre so that in the event of hostilities we could go out and train many more people to form a civilian army.

Now, one of these stories is not right. You cannot have it both ways. Was the story we heard in NATO wrong or is the story we heard here tonight wrong?

Dr. Arnell: I think, in fact, that perhaps what was said earlier gave a slightly wrong impression. The thing that I really was referring to—I think it was in an answer to Mr. Gibson a little while ago—was that until quite recently our officer strength essentially had been held at what was judged to be about the right officer demand mix at the time the total force was of the order of 110,000, that during the period of tight budgets when it was necessary to hold down the manpower a little it was continued to be viewed that we were not, in fact, changing what was essentially our force structure and that in certain areas, such as the training schools and this type of thing, some positions were being left unfilled, as it were. In fact, as part of the hold-back, there has been a reduction in the number of trainees in the last year which has now gone back up again. There is a certain amount of expansion inherent in the fact that we have reserves—this, I think, has been discussed before—and at the present time there are of the order of 28,000 in the reserve forces.

• 2045

These reserve forces in fact, are available to flesh out a regular force in the event of an emergency so that there is an inherent expansion of that amount, but not in the sense of the pre-war concept of a very small regular force of the order of 5,000 or 6,000 with a very, very large reserve organization behind it. What I really was referring to was the fact

that here we had a force structure which was based on a ratio of about one officer to seven men...

Mr. Winch: And now it is 1 to 50.

Dr. Arnell: ...which now is approaching 1 to 50. However, as I pointed out we are in the process of reducing the officer strength to bring it more in line with the earlier ratios. The fact is that with modern equipment and particularly where you are manning equipment rather than equipping men you tend to have higher officer demand ratios and you will find in the case, say, of a typical infantry battalion of the old sense, as I mentioned earlier, that one air division, which is a straight operational force, has an officer demand ratio of about 1 to 6. On the other hand, the brigade is about 1 to 11, but even that, I think you will find, is high in proportion to what used to be considered was an officer demand ratio of a typical land force.

Mr. Winch: When I was in the army it was 1 to 33. I was the only officer in a platoon.

The Chairman: If we could continue with your questions, Mr. Howard.

Mr. Howard (Okanagan Boundary): What would be the approximate ratio of officers to other ranks in the reserve force that you have been talking about? Would not your reserve force be mostly officers?

Dr. Arnell: No, a very large number of the reserve force tends to be I think—although I am afraid we do not have the figures here—land force units.

Mr. Howard (Okanagan Boundary): Are you talking about the Militia or are you talking about...

Dr. Arnell: Yes, this is the Militia.

Mr. Howard (Okanagan Boundary): They already have a full complement of officers in the Militia, do they not?

Dr. Arnell: Yes, but they are only, in effect, organized up to sort of the regiment battalion level so that they would become part of a larger formation if they...

Mr. Howard (Okanagan Boundary): You would need many more officers then to put them...

Dr. Arnell: In fact, this would be the fleshing out type...

Mr. Howard (Okanagan Boundary): A great many brigadier generals would be needed, would they not?

Mr. Harkness: As a matter of actual fact I think you will find that the proportion of officers to NCO's in the Militia is very, very high, indeed. It is higher than in the regular forces.

The Chairman: I would think so, particularly from the experience I have had.

Dr. Arnell: I had not checked it before and I must say I...

Mr. Harkness: I think it is just the reverse of what you said.

Dr. Arnell: ...stand corrected, Mr. Harkness. I do not think I had seen the figures before so I was wrong on this. There are 3,600 officers out of 28,000 reserves, so that really is about the same ratio as everything else.

Mr. Howard (Okanagan Boundary): Then the over-all picture is that you are pretty heavily officered all the way through. How does this compare with the military forces of other countries in the world, say, the United States or the United Kingdom?

Dr. Arnell: I have attempted this comparison on a number of occasions, but there is no common line. The last time I saw some figures the British tended to have a higher officer ratio than we did, particularly in the higher ranks. They tend to run to higher ranks on the grounds that it really does not cost that much more to have a three-star general than a two-star general. At the other extreme, and one that is often thrown up at us as a comparison are the United States Marines which are very lean, but the reason...

• 2050

Mr. Winch: The sergeants have command there.

Dr. Arnell: ...for this is that they draw the bulk of their logistic support, which is one of the areas where you get a lot of rank—from the technical and logistic side—from the United States Navy and in some areas they depend entirely on the U.S. Navy for this support. Therefore, the United States Marine Corps tends to show only part of the officer strength that, in fact, is necessary for them.

Mr. Howard (Okanagan Boundary): How does this ratio compare with the over-all United States forces?

Dr. Arnell: We would be higher, but one of the reasons for this is the fact that they, at the moment, are very much involved in a war with a large number of people in the field who are one-year conscripts or whatever their period of force service is, the bulk of whom never, in fact, are given any real rank at all. They have a very massive turnover of their large number of fighting troops and when you are actually engaged in active combat you tend to have many more privates and corporals than you do in peacetime as we are effectively now.

Mr. Howard (Okanagan Boundary): Would you say then that Canadian forces are very heavily officered and that as we spend \$701.5 million on military pay, theoretically a reduction in the number of officers might save quite a bit of money on our military budget?

Dr. Arnell: Well, as I say, we are in the process of reducing the ratio now but one of the real difficulties connected therewith is the fact that large numbers of officers are specialists—the medical doctors, chaplains and so on. In fact, there are 1,000-odd in the group of doctors, chaplains and dentists and one could argue that unless you reduce the total forces you could not reduce this number because it makes no difference what the rank is, you still need the doctor.

Mr. Winch: If you take out that 1,000 you still have 15,297. You said 1,000.

Dr. Arnell: Yes. Of course also included in that figure are the 1,900 officer cadets in the military colleges and universities.

Mr. Winch: They are not going to be sergeants, they are going to be officers.

Dr. Arnell: But they are going to replace somebody who in fact really will have retired at the front end by the time they come in. The active part of this rank structure should at least have the officer cadets removed from it.

Mr. Winch: You are still defending the one-to-five ratio of officers.

Dr. Arnell: I am not defending it because, as I said, we are in the process of pushing back towards what is viewed as the ratio that

one might expect in a highly equipment-oriented force and that is a ratio of somewhere between one-to-six and one-to-seven.

Mr. Winch: One-to-six to one-to-seven is peacetime but in the field it is one-to-eleven. I am speaking now of armed brigades, I am not speaking of the air force.

Dr. Arnell: Well the brigade would be . . .

Mr. Winch: One-to-eleven.

Dr. Arnell: Yes, but by the time you add in the whole Maritime side I think you will find that it is somewhere in between and comes out at one-to-eight.

Mr. Winch: Well this is one spot where we could save money.

The Chairman: I wonder, Mr. Winch, if we could let Mr. Howard continue with his supplementary.

Mr. Howard (Okanagan-Boundary): You say that you reduced the number of officers by 1200 people in the last year and there has been no noticeable effect on the efficiency of the force?

Dr. Arnell: I think one of the areas that can be debated at length is whether or not in fact it has had an effect on the efficiency of the force. Many military units are organized for their ability to keep operating in a period of an emergency for a period of time and when you are short certain people in the establishment it does not necessarily affect the efficiency of operating, but what it may in fact affect is your staying power if you have to continue operating. For example, one of the areas often debated in this regard—and I only give it as an example—is that if in fact you have to put an air squadron on a 24-hour operation day in and day out the question arises how long you can keep the airplanes flying and it is often debatable whether, in fact the air crew or the ground crew gives out first. In other words, the problem is whether you have to cut down on your planned flying rates because your pilots are too tired to take the aircraft off or, in fact, the ground crew cannot keep up with the maintenance to keep the aircraft flying. If you are short of a certain trade you may have absolutely no efficiency at all within

• 2055

the unit and it may be just as hard to recruit trade. On the other hand you might be able to run at 80 per cent of establishment

and really be efficient for any foreseeable operation. This is the type of thing that we envisage we might be exposed to in the next little while.

This is one reason that the brigade and the air division have always been kept as close as possible to the approved establishment of all the trades that they need. The shortfalls have tended to be back in the training centres rather than in an operational unit which, if used, has to be efficient.

Mr. Howard (Okanagan-Boundary): Do you have any plans to try for another 1,200 men? Do you need another 1,200 this year?

Dr. Arnell: I am not sure what the actual number is but there is a projected decrease in officers that will be going on throughout the year. There is in fact a target for March 1970, which I do not happen to have with me, that they will be trying to achieve.

Mr. Howard (Okanagan-Boundary): Could we get the figure on the reduction that you plan?

Dr. Arnell: I think we could give you a short statement on this subject, yes.

The Chairman: And that will show the extent to which the officers strength will be reduced by March 1970.

Dr. Arnell: Yes.

Mr. Howard (Okanagan Boundary): That is all, thank you.

The Chairman: Mr. Legault.

Mr. Legault: Dr. Arnell, in previous years we had spoken about having reached the point where many were taking their retirement. Are these 1,200 men that you are speaking of men who have reached the retirement stage?

Dr. Arnell: This reduction that I mentioned occurring in the last year or so have all been people who left the force either voluntarily or because they reached retirement age. There has been no force attrition in the last year.

Mr. Legault: And the anticipated number is 1,200 men.

Dr. Arnell: No, that is what we have reduced in the last little while. I would have to check for sure what the actual position is right now.

Mr. Legault: It is an estimate.

Dr. Arnell: Yes. I think I can produce a short paragraph, which the secretary could include, which would answer Mr. Howard's question and also yours.

Mr. Legault: Thank you very much, Doctor.

The Chairman: Mr. Ryan on a supplementary and then Mr. Harkness on a supplementary.

Mr. Ryan: In respect of our military missions abroad, is it your practice to increase the rank of an officer in special situations, such as in Indo-China, so that at least, temporarily, he will have added status while he is there, and is there an understanding with such officer that he will revert, say, from a brigadier to a colonel when he is no longer in that position with that military mission?

Dr. Arnell: It is not our practice, although upon occasion it is done. Generally speaking, on military missions abroad officers of the right rank are selected, or officers who are due for promotion and are promoted into the position; but it is only in the exceptional case that in fact a man will be given an acting rank for such a position.

• 2100

I think we have only really had one or two. The only one that I am sure of is that Major General Milroy, when he was sent to the Nigerian area, was in fact made an acting major general because he was the Commandant at the Armed Forces Staff College at the brigadier level; and although he was given an acting rank for that, by the time he returned there had in fact been a retirement at the major general rank and he was really in line for promotion anyway and was confirmed.

Mr. Winch: Why did you send a colonel to replace him?

Dr. Arnell: To Nigeria? I think it was in fact a change in situation in the observer team.

The Chairman: We are getting away from the supplementary.

Mr. Ryan: Mr. Chairman, I would like to ask if an acting brigadier would be paid the full salary of a brigadier, or whatever the rank might be?

Dr. Arnell: Yes; we pay them when they are given the rank.

Mr. Ryan: Thank you.

Mr. Harkness: Dr. Arnell, these figures are what you might call theoretical, or paper, figures. In other words, you have the total man-years authorized and you allow for the continuing employees, which together come to approximately 98,200 people, but I have a return which you will probably remember, of about five or six weeks ago, showing the present strength, leaving out those on terminal leave, as something between 95,000 and 96,000 rather than 98,000.

Have you the number of officers and NCOs who are presently in the service rather than these paper figures that we are looking at?

Dr. Arnell: I think I can get you the figures. But I would like to explain, relative to these two columns, which are in fact the same...

Mr. Harkness: They are the total man-years authorized.

Dr. Arnell: The situation was that during 1968-69, because of a high figure at the beginning of the year and the fact that only sufficient funds were provided for 100,000 military man-years during the year, it was necessary to decrease the total military manpower quite appreciably. As a result, recruiting was held down for quite a large part of the year and the net result was that the number of train-

• 2105

ees in the stream was about 3,000 less over the year than we would expect to have in order to maintain a constant strength during the year.

In the course of guessing at the turnaround point, the judgment was that we would run below the 98,000 which was the target for March 31, 1969. If, to the figure you have just quoted, you add in the people on terminal leave, my recollection is that it comes to 97,000 and something. We have in effect, under-shot the 98,000 figures, and money is provided in the estimates, in fact, to pay 98,000 apart from the seconded officers; and if you add in the seconded people, for whom somebody else pays, you come out with the total.

Mr. Harkness: The point I am trying to make is that to get at the proportion of officer

and NCO strength we need the actual figures, not the authorized figures, which may be very different indeed.

Dr. Arnell: We do have the latest return here. We can check this for you.

Mr. Winch: Mr. Chairman, if that is all on the personnel question...

The Chairman: No; there are further questions on personnel. Mr. Harkness, have you finished?

Mr. Harkness: No; I have a number of questions on personnel. But as I said, I think that to some extent we have been talking in a vacuum. We are talking about authorized strengths whereas, in my view, we should be talking about the actual strengths.

The Chairman: I have a number of names here. Mr. Cafik, is your question on personnel or equipment?

Mr. Cafik: I have some questions on a number of areas, but I did have some supplementaries on personnel.

The Chairman: Have you a supplementary, as well, Mr. Harkness, on personnel?

Mr. Harkness: Yes, on personnel.

The Chairman: Perhaps we could let Mr. Harkness continue and then call on you, Mr. Cafik.

Mr. Harkness: Relative to the first two groups, general and lieutenant general, for some 20 odd years, and with about 25 per cent more people than we have at the present time in the armed forces, we got along with one full general, or equivalent, and three lieutenant generals. Why is it necessary now to have double that number with 25 per cent fewer people?

Dr. Arnell: I believe it has been quite a number of years since we had as small a number of lieutenant generals as you suggest.

Mr. Harkness: It is exactly five years.

Dr. Arnell: We used to have a lieutenant general at NORAD and a lieutenant general at SHAPE, in addition to the three at Headquarters. I had an idea there was another one somewhere, but we always had a couple of extra lieutenant generals who in fact were on international posting, rather than just the three of the chiefs of staff.

In relation to the present lieutenant general rank, as part of the Canadian Forces Headquarters when it was first set up it had four branches, each of which was headed by a lieutenant general; and, in fact, I guess there were four at the beginning.

Mr. Winch: Now you have seven.

Dr. Arnell: At that time there was still a lieutenant general in Paris and another at NORAD. The one at SHAPE has since been withdrawn, and there still is the Deputy Commander at NORAD; so that the seven that are listed now are in fact the four in Headquarters, the Mobile Commander, the Maritime Commander and the Deputy Chief of Staff at NORAD.

Mr. Harkness: In actual fact, the authorization is for nine, and the two extra that you are talking about are those that you have just mentioned, who were on international assignments; so that the actual general strength—lieutenant general and above—in

• 2110

Canada has been doubled, although the forces have been reduced by 25 per cent. This, to me, just does not make sense, and it never did.

Dr. Arnell: I think the nine that are shown as the total man-years authorized in 1968-69 included at least one lieutenant general on retirement leave. I would have to check that to be certain. The terminal leave rank structure is included in this list.

Mr. Harkness: Let me come back to my basic question. With a 25 per cent decrease in the total forces why is it necessary to have this increase in the number of lieutenant generals?

Dr. Arnell: I would not phrase it quite that way.

Mr. Harkness: I know; but that is the brutal fact.

Dr. Arnell: The reason I say I would not phrase it quite that way is that the rank structure of the lieutenant generals has not in fact gone up as the strength came down. The number of lieutenant-generals was, in fact, set up in 1964 and the senior officer establishment has been essentially unchanged.

Mr. Harkness: The fact that it was set up in 1964 does not make it sacrosanct.

Dr. Arnell: No, sir, I agree with you.

Mr. Harkness: I think it was a mistake to increase it in 1964 and I think it is a worse mistake to have it increased again now.

Dr. Arnell: When I say I would phrase it a little different, it is a case not so much of saying to have it increased now as to continue to have it the way it is, I think.

Mr. Harkness: It has increased with nine now authorized rather than seven.

Dr. Arnell: If you look at 1969-70, the nine is the 1968-69 figure which included, I think...

Mr. Allmand: May I ask a supplementary?

The Chairman: Mr. Allmand on a supplementary.

Mr. Allmand: This may have been said, but do not these rank structures include the integrated forces, the air force and the navy?

Dr. Arnell: Oh, yes.

Mr. Allmand: I see.

Mr. Winch: An admiral is now a general.

Mr. Allmand: So some of these people that were formerly classified under naval and air force positions are all classified together here.

Dr. Arnell: This is the total rank structure.

Mr. Winch: There are still 47 Brigadier-Generals and Generals at Headquarters, and 106 for our entire forces.

The Chairman: I wonder if we could take these one at a time. Mr. Harkness, are you still on this line of questioning?

Mr. Harkness: I am still trying to get an answer to what reason there is for having this—I would say 50 per cent, Dr. Arnell would probably argue 30 or 40 per cent—increase in the number of Lieutenant-General and General positions with a 25 per cent decrease in the total force. This is my simple question, just what justification is there for this?

Mr. Stewart (Cochrane): Imagine if we had a Field Marshal.

Mr. Harkness: It would be just that much worse.

Dr. Arnell: I think all I can say, Mr. Harkness, is that the rank structure was based on a force with a 10 per cent decrease

and, in fact, the senior officer component of it has stayed constant while the rest of the force has been. . .

Mr. Harkness: It has not stayed constant, though; it has increased.

Dr. Arnell: That nine which you refer to is, in fact, a total man-years authorized in 1968 and 1969, and that did include one or two Lieutenant-Generals on retirement leave. This year the total number of man-years authorized and the allowables is seven because it is not anticipated, as I understand it, that there will be any Lieutenant-Generals retiring this year.

Mr. Harkness: All right; if you take that figure one of those seven Lieutenant-Generals is on international service in NORAD and that leaves six who are presumably on service in Canada, in comparison with three five years ago with 25 per cent fewer people to command.

Mr. Winch: Double the number.

• 2115

Mr. Harkness: Double the number. That is what I say; it is a 50 per cent increase no matter how you look at it; or 100 per cent—if you take it from the basic figure it is 100 per cent increase.

Dr. Arnell: I think you will find, although this may be no defence of the figure, that in the same way that a trained serviceman is now called a Corporal, that in fact. . .

Mr. Harkness: I was going to come to this a little later.

Dr. Arnell: I had gone over this earlier with Mr. Winch.

Mr. Harkness: I do not think that is any defence.

The Chairman: Are there any further questions, Mr. Harkness?

Mr. Harkness: Yes; the basic point—and I think this is perhaps what Mr. Winch was on before I came in—is that it would appear that we have a terribly inflated rank structure which results again in an inordinate cost as far as our defence services are concerned in comparison with other countries. If you look at the whole rank structure, coming to what you have just mentioned about corporals, out of the 98,000-odd authorized personnel in 1969-70 we have just about 20 per cent who

are privates. In other words, nearly 80 per cent of our defence forces are either officers or NCO's.

I do not think there is any other defence force in the world that has a proportion anything like that—nothing like it—and I would put to you that the sole reason for the fact that these 38,500 corporals, of whom probably 35,000 or at least 30,000 should be privates and the 11,730 sergeants, at least half of whom should be corporals and would be in any other army, are holding those ranks simply and solely because this was an indirect means of increasing their pay.

An hon. Member: Be careful; they will not vote for you next time.

Mr. Harkness: I do not worry about that. I think this is solely an indirect means of increasing the pay of most of the personnel in the armed forces by putting them into false ranks. I am quite surprised by looking at this to see the number of lieutenants, because I have not been able to find any lieutenants in the various units I have gone around to look at; they are all captains. Practically all the people that are doing lieutenant's jobs are captains, and where these lieutenants are I do not know, because certainly I have not found them in the various units I have been to.

Dr. Arnell: I think that while I accept your criticism of the rank structure I would like to make one point in defence of the NCO ranks particularly. In a number of comparative studies that have been made of the serviceman tradesman and his counterpart in civilian life, it is the judgment of independent assessors that in many cases the serviceman-tradesman, for all that he may be a sergeant or even a warrant officer, in fact does not get as high pay as his supervisory counterpart would in industry or in the maintenance shop of a place like Air Canada, or this type of thing.

This, in fact, is what was aimed at when the reorganization of the pay scheme was put through in 1966, to attempt to provide the equivalent of the civil salary for the military man rather than a smaller pay and a number of allowances that was added to it if he happened to be married, or if he happened to be living in a rented house. I think one can criticize us for the ranks, but perhaps what we should be looking at in this case is the rank and the pay fields against which these people actually draw their salary based on their particular specialty. This is a large

• 2120

schedule because of the large number of trades and skills that exists within the services.

Mr. Harkness: I would think it is far better to have a reasonable rank structure rather than one which is really, I believe, complete nonsense and to pay whatever the necessary rates of pay are for the people employed including trades pay, rather than to have a rank structure of this kind. Looking at any past military organization we have had, and any military organization that I know of in any other country, this is nonsense—this rank structure is really nonsense. When 20 per cent of your personnel are privates or the equivalent and 80 per cent are NCO's and officers, the thing just does not make sense—it just does not make sense.

The Chairman: I have Mr. Cafik, on a supplementary, and then Mr. Allmand will take the floor. Have you further questions, Mr. Harkness?

Mr. Harkness: I have, but I will stop at the moment.

The Chairman: Mr. Cafik and then Mr. Allmand.

Mr. Cafik: The majority of the questions I had in mind in this area have either been asked or I have come to the conclusion that there is not much point in asking them.

I have one, however. At some future date could you give us a schedule of the rates of pay for these basic categories from, general and lieutenant general, right down the line? I would like to have a look at that, in due course. I presume that such things as trades pay are paid over and above their basic figure for that...

Mr. Winch: No, not now; that is the reason for their getting the increased rank.

Mr. Cafik: Therefore, there are no trades pay categories?

An hon. Member: Not now.

Dr. Arnell: There are pay fields within a rank. A highly skilled trade will be in a high pay field and a lower skilled trade will be in a lower pay field. In fact, if you so desire, we could provide some of this detail to be appended to the record, because this is a straight...

Mr. Cafik: I would like to see it appended. And could you give the range? For example, a captain might be from so many thousands a year to so many thousands a year. Their rate would depend on their qualifications, I presume?

Dr. Arnell: The pay fields and the trades pay idea are in the other ranks—the NCOS.

Mr. Cafik: Would you, in what you are going to...

The Chairman: Before we go further, is it agreed that Dr. Arnell will furnish the Clerk with this schedule of information, which will become part of our record?

Some hon. Members: Agreed.

Mr. Cafik: Also, in that schedule could you include any other pay benefits or allowances they would get? Does this vary from rank to rank, or...

Dr. Arnell: There are only a few special allowances. There are no allowances in the old sense at all. The allowances are now relatively few and include such things as divers and parachutists, where there is, in fact, a type of inherent risk that has traditionally been recognized with some additional allowance. There are a limited number of these which, again, I think, could be made available if, in fact, it was desirable. But we have the straight tables of pay here in the orders and they can be reproduced as appendices.

Mr. Guay (St. Boniface): And the doctors are included there?

Dr. Arnell: We can give you the total. We have legal, dental, and so on. It is just a case of extracting the necessary information. Unless, of course, you wish to have a copy of the entire chapter of Queen's Regulations and Orders?

Mr. Cafik: I do not think that is necessary, from my standpoint.

Did you indicate that there were a thousand doctors and dentists in the military service?

Dr. Arnell: The figures I was given show that in the established positions—and whether or not they are filled at the moment. I could not tell you—there were just over 500 doctors, 155 dentists and 233 chaplains.

Mr. Cafik: Chaplains?

Dr. Arnell: Yes. I am not sure what the legal...

Mr. Cafik: I gather that in the military the physical wellbeing is more in need of looking after than their spiritual but this seems to be a phenomenal number of personnel. If a

• 2125

city of 98,000 people had that many doctors in it I presume they would all starve to death.

Mr. Barrett: They are not all in one place.

Mr. Cafik: No; I know they are spread around, of course, but I do not know how many areas they would cover.

Dr. Arnell: They cover everything from field ambulance units, which are ready to go anywhere a battalion goes, to hospitals. We have a number of major military hospitals, and we also have 40-odd bases all of which have at least one doctor associated with them.

Mr. Cafik: These would be the doctors in military hospitals, such as the one here?

Dr. Arnell: And in units; and on bases.

Mr. Cafik: I have one last question. You referred to the strength on the officer level being a little higher than it should be and to reducing it by replacing only half of the vacancies that occur. Do you have any schedule of what you consider to be the advisable strength of each one of these categories that you are working towards; that is, how many lieutenant generals you think you should have, or how many major generals, or how many brigadier generals, and so on? Have you determined this? Are you working towards reducing them to a certain level?

Dr. Arnell: There is one area in which, I think one might say, subjective judgment is required. The rest, I think can be handled in a straight engineered fashion. Operational units are obviously very easy to structure; and operational commands with the command headquarters I do not think require too much subjective judgment on what is needed in the headquarters to support the field units.

Once you get past these you move into the support area, where you have a number of bases with base commanders. In recent years—and I do not really know how far back this goes but certainly it has been so for quite a long period of time—it has been our practice to have a colonel, or his equivalent in rank, in the days before integration, in

charge of a base; and to have more or less the same type of base organization, of a colonel in command, a chief of staff, chief engineer and a chief administrator, and so on. We have tended to maintain a sort of basic rank structure within a base.

It could be argued that below a certain level you should change the structure of a base. They practically all have commanders. There will be slight variations, but, basically speaking we have run a base with a rank structure of a colonel, two or three lieutenant colonels and around eight or nine or 10 majors supporting them. I suppose one could argue that a lieutenant colonel could run a base just as well as a colonel and that in fact, one could lighten the structure all the way. The same is true of—in fact, the earlier discussion in large measure revolved around—the rank structure there should be in a headquarters. One could argue that you could drop the rank of every officer in a headquarters and, in fact, have it that much lighter.

I do not think there is any real way of measuring this. There is an area of subjectivity here that is quite different from when you are talking about rank structure in a ship, or in a squadron of aircraft, and so on.

Another point is, of course, that certainly on the air force side we have traditionally

• 2130

viewed air crew as being officers. It has been argued that senior NCOs can fly airplanes just as well as officers. As I say, there is a certain subjectivity in this that you cannot measure.

The present rank structure is arrived at against a set of principles and the only areas that I think could be debated are CFHQ, perhaps some of the command headquarters, and the technical side; that is do you have to have rank to persuade engineers, and so on, in the same way as doctors and dentists?

Mr. Cafik: Thank you, Dr. Arnell.

The Chairman: Mr. Allmand, on a supplementary, and then Mr. Guay.

Mr. Allmand: Dr. Arnell, this is a related question. I do not know if what is happening in the armed forces relative to rank structure is the same as what is happening in business, but if it is there would be a good explanation for the greater ratio of higher ranks to lower ranks. For example, in industry and business today—and it is for you to tell me if this is happening in the military—compared to five

years ago we see a greater ratio of trained labourers to untrained; a greater ratio of white collars to blue collars; and a greater ratio of administration to staff. The reason for this of course is the greater use of technology and the greater complexity of technology. Is this happening in the military?

Dr. Arnell: This is what I really referred to a bit earlier in defense of the high officer to man ratio—that we are really manning equipment now rather than equipping men and you are really very much technologically oriented in that most equipments now have to have really skilled tradesmen.

Mr. Winch: Why do the other armies of the world not have to do the same thing?

The Chairman: I wonder, Mr. Winch, if we could let Mr. Allmand finish his supplementary.

Mr. Allmand: Mr. Harkness made an allegation that we, compared to other defence forces, are top heavy and I wonder if that allegation is supported in fact. I do not know where we can get some information on this but I would really like to get to the bottom of this. It seems to me that what is happening here is happening in private industry, and I would feel that if that is the case then the greater degree of technology and greater mechanization is justified, but I would like to see if this is also happening in other military forces.

Dr. Arnell: We do have some data. The last time I looked at it it was not as complete as I would like. But I will make a note to bring anything along that I can find the next time I appear before you—as I am sure I am going to have to.

Mr. Allmand: I would be particularly interested in our NATO allies, the United States and Britain.

Dr. Arnell: I can tell you one that is very much the other direction and that is Turkey, because I had occasion to check it a while back.

Mr. Allmand: But that would be reasonable because they would be a force presumably based more on untrained, but unskilled soldiers.

The Chairman: Gentlemen, I wonder if I could interrupt just for a moment. It is rather likely that we are not going to finish Votes 15 and 20 of the Blue Book tonight. We have

stood a number of votes which we have discussed in some detail. Would it be agreeable now if we passed the votes that we have discussed and then continue with Votes 15 and 20.

Some hon. Members: Agreed.

Mr. Harkness: What about the questions that Mr. Guay wanted to have answered on Votes 7, 10 and 12?

The Chairman: I think we have made arrangements in that connection.

Dr. Arnell: This will appear in the Minutes. We agreed to provide the material to the Clerk and he will have it included in the record.

The Chairman: I believe we have agreed to that effect.

Mr. Winch: I do not know what your plans are but as far as I am concerned, I still have four questions when we get to equipment and maintenance.

Dr. Arnell: This is on the Emergency Measures Organization, I think.

Mr. Winch: Just what are your plans?

The Chairman: We are not going to pass Votes 15 and 20 now; we will be able to continue with them later. I merely wish, if it is agreeable, to pass the votes which we have discussed in detail. They would be Votes 5, 7, 10 and 12. Then we will revert to the equipment and personnel items under Votes 15 and 20.

Mr. Harkness: I would point out, Mr. Chairman, that as far as Votes 7, 10 and 12

• 2135

are concerned, when we get the answers to the questions I wanted to have answered and the ones Mr. Guay wanted to have answered, we might have quite a number of other questions. Therefore I would doubt whether it is advisable to pass those votes. As far as Votes 1 and 5 are concerned, I am quite agreeable.

The Chairman: I believe we have agreed, Mr. Harkness, to hold Vote 1 open so that we can raise any further questions—Vote 1 being a general vote.

Mr. Harkness: As long as we are able to ask further questions after we get this further information that we have requested, I am

quite agreeable; I just do not want to be precluded from asking other questions.

The Chairman: No, that is understood. We have agreed to hold Vote 1, which is a general vote, open until the very end so I would think any incidental questions that come up could be asked under that vote. Under those circumstances, shall Vote 5 pass?

Vote 5 agreed to.

Mr. Howard (Okanagan-Boundary): I have a point of order on Vote 7. In view of what seemed to me to be unsatisfactory answers that we got this afternoon, is it possible for us to have a rider attached to this Vote that we have a further investigation of the Emergency Measures Organization—say, a reference to this Committee that it be studied in greater detail?

Mr. Winch: I was going to say, that part of our terms of reference was discussion on civil defence. Am I not correct, Mr. Chairman?

The Chairman: Yes, when we filed our interim report with Parliament we specifically reserved the question of civil defence. We will have an adequate opportunity at an appropriate time to go into it, and I think our record indicates the necessity of going into that at some considerable length.

Mr. Harkness: This is the very point I had in mind when I was doubtful about passing Votes 7, 10 and 12.

The Chairman: Then in those circumstances is it agreed that those votes shall carry?

Votes 7, 10 and 12 agreed to.

The Chairman: Perhaps now we can continue on the general heading "Defence Services" Votes 15 and 20. We are still on personnel and I believe Mr. Allmand, was raising a supplementary question.

Mr. Allmand: Dr. Arnell said he would try and provide us with some comparative data relating to the ratio of higher ranks to lower ranks in other NATO forces and I would like to see that. I have finished my questioning.

The Chairman: Mr. Guay?

Mr. Guay (St. Boniface): Dr. Arnell, have you formulated a policy or planned programs regarding reducing the number of armed forces and, if so, does such a policy take into consideration (a) keeping the proper ratio of officers and men (b) spell out how you will keep in the army fairly young and active

personnel? In other words—If you were not taking such people in at the other end of the line would it not be possible that eventually we would end up with a preponderance of old grey haired high ranking officers in the forces?

Dr. Arnell: This is part of the current study being undertaken for the government as a result of the Prime Minister's announcement a couple of weeks ago of the planned restructuring—I guess that is the best word for it—of Canadian defence and until such time as this study is completed one does not know quite what the shape will be. However, I can assure you from discussions I have had with people who are undertaking this study that they are looking at the entire situation. In fact they are looking into areas which we have mentioned tonight, ranging all the way from the foreign liaison type of activity right through to the military participation in civil defence. They are looking right across the entire board because the new policy as defined in broad terms is quite a new approach to defence forces in peacetime. I

• 2140

really cannot give you any idea just what the outcome is going to be because the studies are just getting going now, but they are going to look at every aspect of the rank structure which does reflect the organizational concept.

Mr. Barrett: A supplementary, Mr. Chairman.

The Chairman: Mr. Barrett on a supplementary.

Mr. Barrett: Is there a possibility then that instead of declining it might increase with such a policy?

Dr. Arnell: As far as this is concerned, one has only some of the statements of the Prime Minister that suggest how he, himself, sees this going. I would say at the moment that we are examining the effect of withdrawing from the present role in Europe and what might be done in the way of restructuring forces to give more meaning to the concept of having what I believe, as the phrase goes, "completely compatible forces".

Mr. Barrett: You mentioned about civil defence, therefore if they are going to put troops in civil defence I would assume that it automatically would have to increase.

Dr. Arnell: Well, again—and I feel that this afternoon's discussion revolved in large measure around it—under the BNA Act you get into the federal-provincial areas of responsibility and really the federal people have much more a co-ordinating role than stepping into areas that in large measure are provincial. As to just what will come out of all this I really have no idea at all. I only use this as one experience, with the foreign liaison type of thing being the other extreme of looking at what the military is going to do in the future.

The Chairman: Mr. Guay have you finished?

Mr. Guay (St. Boniface): This was a question that I wanted to bring out and the doctor is assuring us, as you know Mr. Chairman, that they look into every aspect. That being the case there is no use my going any further with this question.

The Chairman: Mr. Ralph Stewart and then Mr. Cafik. Do you have a question Mr. Stewart?

Mr. Stewart (Cochrane): I was going to suggest, Mr. Chairman, perhaps the mood of the Committee is that we pass all of these estimates.

Mr. Winch: I have been waiting through two meetings to ask questions and I intend to ask them.

The Chairman: Mr. Cafik do you have further questions on personnel?

Mr. Cafik: No, I want to ask questions on equipment, please.

The Chairman: Are there any further questions on personnel before we move on to equipment?

Mr. Harkness: I would like to make an observation or two with regard to personnel. First of all, I doubt very much that what Dr. Arnell has just been saying about a change in roles will have much effect on rank structure. I, personally, find it very difficult to see why, if you change the role you are going to change the rank structure very materially. It seems to me that one of the most useful things this Committee could do would be to exert some pressure in order to get a more realistic rank structure.

I do not think there is any question, when we have reached a situation where we have one chief or sub-chief for every one-fifth

Indian, that the situation is ridiculous. I hope this Committee will be able to make a recommendation for a complete revision of the rank structure to bring it into what I think most people would look upon as a more realistic type of rank structure.

The Chairman: Following along on that comment, Dr. Arnell, you have given a number of reasons why the officer strength bears a high proportion to the total; nevertheless, on balance, there did seem to be an indication that the basic reason is simply that we have been reducing our total strength probably faster than our officer strength. Would that be a fair statement of the basic reason for the high percentage of officers at this time?

Dr. Arnell: No change in the commitment pattern.

• 2145

The Chairman: The way you have been rectifying that is to adopt a policy of just filling every second vacancy in officer rank as these vacancies occur. That seems rather an arbitrary, not completely rational, way of releasing a force.

Dr. Arnell: We had agreed on a target at the far end of this; it was not to go on indefinitely. I think the point now is that for the next year the current studies are under way on what is going to be the result of the restructuring coming out of this defence review. I do not think there is any doubt that there is going to be a re-organization of rank structure from the top down. I think it is recognized by all that there is—

Mr. Cafik: I have a supplementary on that, Mr. Chairman and I think it is rather a good point. If we are overextended in terms of officers why would you fill half of them? If you have too many, why do you not do it right and not replace any of these people until such time as you are down to the strength level that you want? You are taking twice as long to do it, I think.

Dr. Arnell: It came out from the point of view of morale. If, in fact, all promotion were stopped for a period of time morale would be affected. Particularly in a time when things were a little touchy anyway, it was viewed as being too drastic. After looking at the over-all picture it was judged that it could be done within a reasonable period of time, and a target for a new rank structure was set to be met over a period of a year or eighteen months.

The Chairman: I think it is quite clear that this system though tends to result in the higher ranking officers remaining simply because they are more highly paid and they are not likely to retire voluntarily.

Dr. Arnell: Yes, but you also find that the higher ranking officers tend to be the older ones who come up for retirement reasonably regularly. As I pointed out, the general ranks were, in fact, excluded from the purpose of this straight run-down because the general ranks were tied to command structure organizations and CFHQ, and had a lot of the NORAD and SHAPE and this type of structure in them.

The Chairman: Mr. Ryan, with regard to personnel and then Mr. Winch, with regard to personnel. Perhaps we could decide now, as it is 9.50 p.m., to defer equipment to our next sitting and just finish the question of personnel this evening, if we can. Mr. Ryan?

Mr. Ryan: I have two questions in respect of personnel, Mr. Chairman. First of all, for the year 1969-70 in the Estimates this projection of paying 3,334 lieutenants and almost as many majors, 3,258; there is only a difference of 76 between these two categories. I wonder what the explanation would be for so many majors. In fact, back around September, 1968 there were a few more majors than there were lieutenants on pay.

Dr. Arnell: Well major is a rank that many pilots achieve automatically because of outside competition. The rank structure on the flying side was, in fact, increased by adding majors a while back to meet really straight competition. The other part of it is, as Mr. Harkness noted earlier, that the time spent as a lieutenant has become, in many cases, sort of the training period of a man's life. By the time he is fully trained as an officer he is practically ready to be promoted to captain.

• 2150

So in many areas the captain is the first serving rank. It tends to be a case of grouping captain and lieutenant as either one filling most of the operational vacancies, in the same way that the corporal-private tends to get grouped together. I think when you have a chance to study the pay rates you will find that the corresponding salaries are quite comparable to civilian salaries. One, in fact, finds essentially the same thing on the public service side. In some categories there is no use being made at all of the first two officer posi-

tions. And I think that in the public service there is a rank structure very similar to what is being discussed on the military side tonight.

Mr. Ryan: I take it that this follows when you have a professional permanent force such as we have, this situation that you have just described. And it is true for other countries as well, with their armed forces.

Dr. Arnell: And when you have to compete in a fairly sophisticated environment in civil life.

Mr. Ryan: I have another question in mind in respect to your statement that there are 500 doctors and I believe you said 150 dentists in the armed forces. I was wondering what pay doctors and dentists start at? What is their rank to begin with? What can they attain? And why is it that we need 500 when the force is under 100,000? That is one doctor for less than 200 personnel, though it may include the families of many of the personnel.

Dr. Arnell: All the families overseas come under the doctors who are with the Brigade and I Air Division, and also in outlying posts.

Mr. Ryan: Would you be able to give us the figure, the ratio of doctors per persons served?

Dr. Arnell: First of all, to answer your question on pay, this is in the pay tables that we were going to have added to the Minutes. We were going to give you the whole cross section. I think we could probably produce a table showing the distribution of medical positions and those that are filled across the whole organization, in bases and hospitals and so on.

The Chairman: I think that would be useful. We should know how many are in Canada, for example, because it is a little difficult to see why we need doctors on staff in Toronto or in Ottawa. It might be cheaper to use civilian doctors rather than military doctors, or it might not be. I do not know.

Mr. Ryan: We would need them on board ship, for instance, one or two, or three.

The Chairman: And at isolated posts. Did you have any further questions, Mr. Ryan?

Mr. Ryan: No. If we can get that information, I will be very pleased.

The Chairman: Mr. Winch.

Mr. Winch: Mr. Chairman. I was most interested in one word that was used by the Doctor a few moments ago. It is the first time it has come up, and is very important. It is the question of morale, which is a most important matter in the armed services. The Doctor happened to mention what would happen to the morale if all ranks were frozen. I have a great many friends in the armed forces, and on speaking to them I find that one of the reasons why they are contemplating resigning from the armed forces is because of what they say is the lack of any possibility of promotion. One reason perhaps is that some are held in the higher echelon beyond the normal period of retirement. Not being personal at all, but for example our one general who is now two years beyond the

• 2155

usual retirement age.

I do not want to see any drop in experience, but I personally know of lieutenants who over a year ago passed their captaincy. I know many captains who over a year ago passed their exams for majority. So if people went out, you would still have the experience, but with the younger people coming up.

You brought morale into the question. Now I know you are going to lose many officers this year who passed for higher ranks a long time ago, and just the way things are going now in the higher echelon they cannot see any possibility of promotion. Would you perhaps make a comment? I think this morale is a most important question in the armed forces.

Dr. Arnell: I do not know just how to answer your comment Mr. Winch, because I would need to know if you are speaking of a man with a specialty which is limited in its prospects in relation to another one, or whether you are speaking of opportunities in general.

Mr. Winch: No, I am not. As I say, a number of officers across Canada have told me that they are going to get out. There are two reasons. First, they cannot see the possibility of promotion; and second, they are tripping over each other now, not knowing what to do. They are just tripping over each other. And that is affecting morale.

Mr. Penner: I hope some of those who want to get out are doctors and dentists. We have a tremendous need in my area of the country for a few of those. Are there any, do you know, Mr. Winch?

Mr. Winch: No.

The Chairman: I do not know whether Dr. Arnell has any comment or not.

Dr. Arnell: Rather than try to answer it myself I might ask the personnel man who is here if he would like to add anything specifically to this.

General Truemner, who is from the personnel side, might comment on this, particularly on Mr. Winch's question of lieutenants who feel that they have no future to get promoted to captains.

Brig. Gen. G. R. Truemner (Director General of Personnel, Plans and Requirements, Department of National Defence): I cannot add much to what you have said except to say that it seems to me the mood of the meeting is to reduce the rank structure, and of course this is one of the things that would make the condition that you allege even worse.

Mr. Winch: No, because I am talking on your basis of the upper echelon going out and bringing up the others. But also I am very glad that you are where you are at the moment. As a personnel man, has hit been drawn to your attention that many officers are getting low in morale because they say there are so many officers that they are tripping over each other?

Brig Gen. Truemner: Sir, I have been in the service for 29 years and I have heard that for 29 years.

Mr. Winch: Has it increased in tempo this last two or three years?

Brig. Gen. Truemner: I do not think so.

The Chairman: Mr. Guay, did you have a question to direct to the General?

Mr. Guay (St. Boniface): First of all, concerning what Mr. Winch has said, I would like to compliment the young man for reaching the rank of general. I think it shows certainly his efficiency to have reached that status.

My question pertains to personnel. If you cannot answer it tonight, we can deal with it another time. If an immigrant comes to this country, we will say for example from

• 2200

France, and joins the army and intimates to you that he wants to make a career of it, do you waive the waiting period that is usually

called for, I think it is five years, to make it possible for him to be able to get up in the ranks of the army?

Brig. Gen. Truemner: No, sir. The requirement now to join the Canadian Armed Forces is that you be a Canadian citizen, and that takes five years. Therefore, the answer is "no" sir. We have provisions within the regulations to make exceptions if a trade or a skill that we have no other way of getting is involved, and if the security of the country in accepting the man is not at stake.

An hon. Member: I have a supplementary on this.

The Chairman: There are three supplementaries. Mr. Legault.

Mr. Legault: There is a case where a new immigrant who has been in the Canadian army for approximately two years, he enlisted immediately upon obtaining his landed immigrant status and obtained his citizenship immediately.

Brig. Gen. Truemner: You are talking about a special case and I would want to look up the details of it before enlarging on it. There is an avenue for waiving this under a certain age and in certain cases, as I said, at the pleasure of the Chief of the Defence Staff; and the Regulations are so written.

Mr. Legault: I think we should be able to provide you with the information that you request.

Mr. Guay (St. Boniface): This is the only question I wanted to ask the General and I told him if he could not answer it today he could answer it later on. We had a specific case in mind and that is why I mentioned it.

The Chairman: There are three supplementaries. Mr. Legault, have you finished your supplementary?

Mr. Legault: Yes.

The Chairman: Mr. Prud'homme did you have a supplementary on this?

Mr. Prud'homme: No, Mr. Chairman.

The Chairman: Mr. Allmand, you may proceed.

Mr. Allmand: Along this same line, once you have Canadian citizens and are advancing them and giving them promotions, do you differentiate at all as to whether they are native born or non-native born but naturalized? I have had complaints made to me that servicemen were not given special jobs and special promotions because,—although they were Canadian citizens, they were naturalized Canadian citizens.

Brig. Gen. Truemner: The answer clearly is "no". If you look carefully at the spelling of my name I think that would be a satisfactory answer.

Mr. Winch: Mr. Chairman, the time being what it is, may I ask whether at our meeting tomorrow night we go on to External Affairs estimates or do you intend to follow through and complete defence estimates.

The Chairman: Tomorrow night we will be in Room 308, West Block at 8 p.m. and we will be on External Affairs estimates. A week tomorrow we will be on the CIDA estimates. It is quite apparent we cannot finish the defence estimates this evening and we probably will not be able to get back to them until sometime next week. I will try to arrange an appropriate time.

• 2205

Mr. Prud'homme: Could we not complete the questioning tonight?

Mr. Winch: A number of questions still have to be asked on equipment, maintenance and so on.

The Chairman: It is quite apparent that we are not going to be able to finish Vote 15 tonight Mr. Prud'homme. I am quite prepared to continue if members wish to, but it is after 10 o'clock. We have had a long session since 3.30 this afternoon. Perhaps I should now thank Dr. Arnell and his staff, and say that we will be seeing them again before too long, if not this week.

APPENDIX VV

POTENTIAL CASUALTIES

The estimation of casualties which might occur from an attack depend upon a great many variable factors and it is, therefore, desirable to postulate these before making casualty predictions. In a study which was carried out by Canada EMO recently, there was a requirement for potential casualty figures, resulting from an attack which represented neither the heaviest possible attack nor the lightest, but was nevertheless, a completely plausible one.

Of the various attack studies available, that which suited the above purpose best was taken from a study prepared by the Defence Research Board. This attack had 300 aim points in North America, including Canada, and represented a likely attack upon which planning could be based up to and including 1975. A synopsis of this attack is set out below:

*Details of Plausible Attack for 1975
Population Distribution—Day*

Population distribution in cities has been based on a day-time distribution.

Warning

Assumptions regarding warning are as follows:

- (a) Warning of the actual attack is insufficient to allow protective measures to be taken against direct effects.
- (b) Population outside the area of direct effects will be aware that the attack has occurred in sufficient time to utilize available shelter against fallout radiation.

Protection

Under the assumptions made regarding warning, the only protection utilized will be fallout shelter. The level of protection assumed is necessarily somewhat arbitrary. If no warning was assumed, the natural distribution of population between indoors and

indoors might be such as to provide an average protection factor of around 3. With warning, but no detailed knowledge of effects and protection measures, it may still be expected that a considerable fraction of the population will use basements for protection, at least part of the time, and that there will be few outdoors. It is assumed that this will increase the average protection factor to 6, and this figure has been used.

Single Attack Pattern

In order to provide a definite reference base as standard, a single attack pattern has been assumed. The number of targets (300) chosen is considered a likely one taking into consideration the magnitude of the Soviet Threat in 1975, the probable effectiveness of active defences and the level of damage the attacker may wish to achieve. The total number may be varied considerably without appreciably affecting the number of Canadian targets attacked.

Weight of Attack

300 Aim Point Attack for North America including Canada;

3 cities, 50 MT each; 8 cities, 10 MT each; 3 cities, 2 MT each; 3 cities, (US-Canada 102 MT Total): 17 cities, 236 MT in all (plus part of 102 MT Total)

Ground Bursts

All bursts in Canada have been assumed to be ground bursts. This maximizes fallout effects, and with the yields assumed in relation to city size, involves only a minor decrease in direct casualties.

Accuracy

For the purpose of the calculations in this study, it has been assumed that all aim points are hit.

Casualties

Casualties (Millions)					
Classification	Direct		Fallout	Total	Casualties
	Urban	Rural	Mainly Rural	Urban & Rural	Percentage of Total Population
Killed	8.0	0.333	0.500	8.53	38.8
Seriously Injured	0.4	0.036	0.356	0.79	3.6
Lightly Injured	0.10	0.026	0.642	0.77	3.5
Uninjured Surviving	4.5	7.41		11.91	54.1
TOTALS	13.00	9.00		22.00	100.0

Radiation Recovery

The radiation casualties have been estimated on the basis of an acute dosage and do not, therefore, take into account any radiation recovery.

Summer-Winter Variation

Differences between winter and summer conditions have been ignored. Casualties quoted are the initial distribution following the burst and are not modified according to mortality in the days following. In these circumstances, allowance for the difference in survivability in winter and summer can be avoided.

Population Growth

Allowance for population growth to 1975 has been made on a fairly conservative basis. The growth has been limited to urban population and is accompanied by some decrease in the rural population. Projected totals are:

Weather Variation

No allowance has been made for weather degradation of nuclear effects. The assumption of ground bursts minimizes errors due to this omission.

Urban	13 millions
Rural	9 millions
TOTAL:	22 millions

No. 38

TUESDAY, APRIL 22, 1969

Respecting
Estimates, 1969-70, Department of External Affairs.

WITNESSES:

(See Minutes of Proceedings)

STANDING COMMITTEE ON EXTERNAL AFFAIRS
AND NATIONAL DEFENCE

Chairman: Mr. Ian Wahn

Vice-Chairman: Mr. Perry Ryan

and Messrs.

Allmand,	Groos,	Marceau,
Anderson,	Guay (<i>St. Boniface</i>),	Nesbitt,
Barrett,	Harkness,	Nowlan,
Brewin,	Howard (<i>Okanagan</i>	Penner,
¹ Buchanan,	<i>Boundary</i>),	Prud'homme,
Cafik,	Laniel,	Stewart (<i>Cochrane</i>),
Carter,	Laprise,	Stewart (<i>Marquette</i>),
Fairweather,	Legault,	Thompson (<i>Red Deer</i>),
Forrestall,	Lewis,	Winch—(30).
Gibson,	MacLean,	

(Quorum 16)

Hugh R. Stewart,

Clerk of the Committee.

Pursuant to Standing Order 65(4) (b):

¹ Mr. Buchanan replaced Mr. Smith (*Northumberland-Miramichi*) on April 22, 1969.

MINUTES OF PROCEEDINGS

[Text]

TUESDAY, April 22, 1969.

(58)

The Standing Committee on External Affairs and National Defence met at 8:15 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Brewin, Buchanan, Cafik, Forrestall, Gibson, Groos, Guay (*St. Boniface*), Howard (*Okanagan Boundary*), Laniel, Legault, Marceau, Penner, Ryan, Stewart (*Marquette*), Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch (21).

Also present: Mr. Roberts, M.P.

Witnesses: From the Department of External Affairs: Mr. M. Cadieux, Under Secretary of State for External Affairs; Mr. T. H. Bennett, Director General Finance and Administration; Mr. G. G. Riddell, Head, African and Middle Eastern Division.

The Chairman called Item 1 *Administration, Operation and Maintenance, etc.* \$49,133,800 of the Estimates, 1969-70, Department of External Affairs.

The Chairman introduced Mr. M. Cadieux, Under Secretary of State for External Affairs. Mr. Cadieux answered questions under Item 1, assisted by Mr. Bennett.

The Chairman called Item 10 *Construction etc.* \$7,000,000 and Item 15 *Grants, etc.* \$18,957,800. Members questioned Mr. Cadieux under all three of the Items as called. Mr. Cadieux was assisted by Mr. Bennett and Mr. Riddell.

The Division bells rang at approximately 9:10 p.m., to summon Members for votes in the House.

With the questioning continuing, the Committee adjourned at 9:15 p.m., until Tuesday, April 29, 1969, at 11:00 a.m.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Tuesday, April 22, 1969.

The Chairman: Gentlemen, I believe we are ready to start.

This evening we have before us estimates of the Department of External Affairs. To give you some idea of the timing, the estimates are rather short, as you will notice, and we hope we will be able to dispose of them this evening. However, if this proves to be impossible, we can always schedule another hearing.

I should point out to you that the items dealing with CIDA, or the aid agency, will not be dealt with tonight. We have another meeting scheduled next Tuesday to deal with Votes 30, 35 and L35. So basically tonight we will be dealing with Votes 1, 10 and 15 of the Department of External Affairs. Vote 40 relates to the International Joint Commission. We do not have anyone here this evening who could deal specifically with that Vote. If you have any questions, we will have to postpone passing that Vote until our next meeting. If you have questions with regard to the foreign policy aspects of it, then it could be answered

• 2015

by Mr. Cadieux or others present.

Accordingly I will now call Vote 1.

Department of External Affairs

- 1 Administration, Operation and Maintenance, including the payment of remuneration subject to the approval of the Governor in Council in connection with the assignment by the Canadian Government of Canadians to the staffs of the International Organizations detailed in the Estimates, and authority to make recoverable advances in amounts not exceeding in the aggregate the amounts of the shares of those Organizations of such expenses; authority for the appointment and notwithstanding section 7 of the Financial Administration Act the fixing of salaries by the Governor in Council of High Commissioners, Ambassadors, Ministers Plenipotentiary, Consuls, Commissioners (International

Commissions for Supervision and Control in Indo-China), Secretaries, and staff of such officials; and assistance in repatriation of distressed Canadian citizens and persons of Canadian domicile abroad, including their dependents; cultural relations and academic exchange programs with other countries—\$49,133,800

We have in attendance tonight the Under-Secretary of State for External Affairs, Mr. Marcel Cadieux. He appeared before our Committee last December and I am sure he needs no further introduction. Do you have an introductory statement to make, Mr. Cadieux?

Mr. Marcel Cadieux, Q.C. (Under-Secretary of State for External Affairs): No, I do not.

The Chairman: Mr. Cadieux is now available to answer any questions which any member may have with regard to the estimates.

Mr. Forrestall: Mr. Chairman, before we start questioning, could I ask whether or not the Minister will be made available to us at all this year in connection with the estimates?

The Chairman: We had not intended to ask him to appear for the estimates. As you know, we have a general policy reference and he certainly will be available when we get on to policy questions. If any policy questions do come up which require the Minister's attendance, we could simply stand the item involved until the Minister does appear. We did not anticipate, though, that there would be any lengthy questioning with regard to basic questions of policy. These would be deferred until our general policy review. Mr. Laniel.

[Interpretation]

Mr. Laniel: Mr. Cadieux, I have a few questions. In the definition of Vote 1, you talk about:

the authorization to make recoverable loans not exceeding the overall sum of the parts of those costs payable by these organizations.

Is there a provision in the overall amount of the Estimates, for \$75 million for this year, and is there a reserve or do these recoverable amounts come back to you during the year, or even those of the preceding years? Because I see on page 8 of the new Estimates, that you deduct a recoverable amount of \$99,000. Does this amount have a bearing on amounts recoverable in past years or current years?

Mr. Cadieux: I think I'll ask my colleague, who is an expert on financial questions, to answer.

[English]

Mr. T. H. Bennett (Director General, Finance and Administration Branch, Department of External Affairs): The amounts shown as recoverable in the pamphlet on page 8 are amounts that are estimated to be recoverable in the year that is shown.

Mr. Laniel: From previous advances?

Mr. Bennett: No.

Mr. Laniel: From the current year.

Mr. Bennett: That is right. There are amounts that we recover from other departments for expenditures we incur on their behalf.

Mr. Laniel: And they are included in the different items of the estimates, not identified as such necessarily?

Mr. Bennett: That is right.

Mr. Guay (St. Boniface): May I ask a supplementary question? Could you give us an indication, sir, of where this money which is recoverable comes from? Could you give us an example of what it is and how you recover it?

Mr. Bennett: For example, when there is an item in the estimates for payments in aid of distressed Canadians, these payments are advanced by the Department to Canadians who become distressed in foreign countries through no fault of their own. They are, in effect, loans, and as such they are recoverable from individuals by the Department. In addition, there are amounts which we pay on behalf of other government departments which we recover from them. For instance in our chanceries where we rent the chancery property, the gross amount of the rent is distributed on a square foot basis among other departments who occupy the chancery and we recover at a rate from them.

• 2020

Mr. Guay (St. Boniface): Thank you, Mr. Chairman.

Mr. Laniel: My second question, Mr. Cadieux. For Vote 1, there is a difference of \$5 million in the increase of the vote for general services of the Department. This is almost 8 per cent in comparison to last year, and perhaps twice as much as the difference with the year 1967-1968. Is this increase due mainly to salary increases?

Mr. Cadieux: There is an increase in salaries, but also in general overhead costs. Rental costs abroad have increased, and communication with missions abroad, travelling expenses and slight increases in staff may contribute to the increase of expenditures. I believe it is this sort of items that have contributed to this.

Then we have contributions to organizations, but this is not taken into account. I think it is mostly salaries, allowances, and operating costs: rent, and so forth.

Mr. Laniel: Yes, because as far as embassies are concerned, I notice that all those costs are grouped under Vote 10.

Mr. Cadieux: Yes, indeed.

Mr. Laniel: These would be rents in Ottawa?

Mr. Cadieux: Yes . . .

Mr. Laniel: . . . but not necessarily in connection with foreign missions?

Mr. Cadieux: It's mostly salaries and maintenance costs such as electricity, and so forth.

Mr. Laniel: On page 8 you talk about cultural relation and university exchange programs with other countries.

Mr. Cadieux: Yes.

Mr. Laniel: And on page 89 of the previous Estimates, we see that a figure of \$1,910,000 is mentioned.

Could you explain how this amount of \$1,910,000 is spent? Page 89 of the previous estimates. There are no details, although—

Mr. Cadieux: Yes . . .

Mr. Laniel: . . . the new presentation gives us no idea what this means.

Mr. Cadieux: Well, in the first place, you have academic exchanges scholarships to Belgium, France, Switzerland. And, for these three countries, this is a total of \$750,000.

In addition, there are cultural activities such as tours by Les Grands Ballets Canadiens, by the Canadian Opera Company which is going to perform the opera *Louis Riel*; the Théâtre du Nouveau Monde which is also going to participate in the Festival du Marais, and then, there is also an exhibition of Canadian Eskimo Art that was opened recently in Paris. This gives you an idea of the type of cultural activities concerned.

Then, there are cultural activities with other countries, such as England, for instance. There are also academic exchanges similar to those with the French-speaking countries I just mentioned, with Germany, scholarships, Italy, The Netherlands, and activities...

Mr. Laniel: I'm not asking you for a detailed enumeration.

Mr. Cadieux: Yes.

Mr. Laniel: The reason why I put this question, is because I have tried to establish a relationship between this amount and an amount of \$250,000 listed this year under the Department of National Defence Estimates, that was provided last year for the setting up of five university professorships, and I was wondering whether the Department of External Affairs has something similar?

Mr. Cadieux: No. We have no similar amount in connection with the direct creation of professorships. What we are considering is establishing closer relations with the university world in Canada, for the purpose of the Department's activities. And, this would be somewhat similar to the activities you mentioned, as we are considering the appointment of certain officers from the Department to take courses in the universities. At the outset we might have at least 2 or 3 who would go to some universities to participate in university activities.

Mr. Laniel: Do you use university people to carry out studies for your Department?

Mr. Cadieux: We invite university people to come and train with us, and one of them, for instance works in the Historical Section for the publication of certain documents. And, during the summer, we have a number of young students who come for a certain period to become familiar with the work of

• 2025

the Department. There are about a dozen students who have been working for us for a number of years and who are recruited by the Public Service to do this work.

Mr. Laniel: Are you able to recruit several of these students later on?

Mr. Cadieux: Yes. If they sit for the exam, and it depends on how they manage in their exams.

Mr. Laniel: Yes, but they are graduates, aren't they?

Mr. Cadieux: They usually are in their last year of university or they are doing post-graduate work.

Now, the Department also contributes \$50,000 per year to the *Association des universités de langue française*. This is part of our budget; these are universities throughout the world.

Mr. Laniel: Is the amount shown in vote 10, on page 11, for the purchase of a cultural centre in Paris in line with an exchange policy, or is this for Canadians in Europe?

Mr. Cadieux: This is for Canadians living in Paris. The policy has yet to be drawn up, but a building has been bought by the Canadian government. This building is being renovated and will be used by both French-speaking and English-speaking Canadians. The exact formula still remains to be drawn up by the government.

Mr. Laniel: One last question, Mr. Chairman. I am changing the subject somewhat. Do you have, in your Estimates, an approximate amount for setting up a diplomatic mission or embassy in Peking?

Mr. Cadieux: No.

Mr. Laniel: This would be an additional vote?

Mr. Cadieux: Well, we have taken into account that we might have a diplomatic mission in Peking, but only for the purpose of planning. But, for the time being, we don't have anything specified in the Estimates.

Mr. Laniel: Real estate or other?

Mr. Cadieux: No. Because as long as the agreement has not been signed we do not know what the importance of the mission

would be, and, we don't know how much it would cost. We do not know exactly.

Mr. Laniel: Thank you very much.

Thank you, Mr. Chairman. I have a question on Vote 15 but I had better wait.

The Chairman: Yes, we will take that up when we come to Vote 15. Mr. Thompson.

Mr. Thompson (Red Deer): Mr. Chairman, my first question relates to the item "New Missions" on page 8. I wonder if we might be told what new missions are contemplated this year that would be allowed for in the proposed estimates 1969-70?

Mr. Cadieux: We are hoping that it will be possible in the course of this year to open additional missions in Francophone countries. Just which countries has not been determined yet. This is a matter for government consideration and the matter is before the government now. There is my difficulty in answering.

Mr. Thompson (Red Deer): Is China included in that figure?

Mr. Cadieux: China? No. There is no provision for China in this budget.

Mr. Thompson (Red Deer): Then this figure of \$715,000 is an estimate?

Mr. Cadieux: It is an estimate. Usually missions cost about \$300,000 each I think. Therefore, you have here an estimate that we would need for about three missions.

Mr. Thompson (Red Deer): Might we also be informed of missions that have actually been opened in this current 1968-69 year?

Mr. Cadieux: There have been no others.

Mr. Thompson (Red Deer): None opened at all during this year?

Mr. Cadieux: No.

Mr. Allmand: May I ask a supplementary on that?

The Chairman: Mr. Allmand, on a supplementary.

Mr. Allmand: Mr. Cadieux, I notice that last year there was no item for "new missions" and this year you have an item of \$715,000 but you have no specific plans for the missions.

Mr. Cadieux: The plans are before the government.

Mr. Allmand: I see. But you do not know what countries they have in mind?

Mr. Cadieux: I know but I am not at liberty to say. This is going to be determined by the government and it is not up to me, an official, to state this.

Mr. Allmand: I see. But they have particular places in mind.

Mr. Cadieux: Yes, I am sure that they have some proposals but there are alternatives. There are various considerations that enter into it and until they have made their decision it is not possible for me to say.

Mr. Allmand: Thank you.

Mr. Thompson (Red Deer): Mr. Chairman, in respect of the various expenditures for the different missions abroad, there are some that have decreased. Others show a very substantial increase. For example, France has gone

● 2030

up a quarter of a million dollars approximately. There is also an increase of \$152,000 in capital expenditure under Ghana—\$237,000 versus \$85,000. I wonder if we might have a brief report on these major increases without asking specific questions on each one that we might dig out? Is that too difficult?

Mr. Cadieux: I think without doing research in the particular case of France and if I may answer generally, this could increase according to the general cost in France. If the index goes up there because the cost of living has gone up, then your general cost as far as France is concerned would have to be increased. This would be the first factor. The second factor that you would have to take into account would be any increase in the number of staff which would be reflected immediately in the estimates. These are the two major ones, I think, that occur to me, the cost of living locally plus the staff.

Mr. Forrestall: May I ask a supplementary? The items that Mr. Thompson referred to are capital items and perhaps, for example, we might look at the one for India which has gone from \$671,000 to \$1,049,000. It was this type of item, not the operational cost, to which, I believe, Mr. Thompson was referring.

Mr. Cadieux: In India we have had the site for a number of years and now, I think, we have started to develop it by building accommodation for the staff and for offices.

Mr. Thompson (Red Deer): Does this represent a complete new building? • 2035

Mr. Cadieux: This is the beginning. I think there are various stages that are foreseen and the expenditure shown there for India is for that purpose.

Mr. Thompson (Red Deer): Does this also apply to, say, Ghana?

Mr. Cadieux: In the case of Ghana, certainly.

Mr. Thompson (Red Deer): Could we have some idea of where we are erecting new buildings? We have just completed a new establishment in Bonn.

Mr. Cadieux: Yes, in the case of Ghana, for instance, the plans for this year call for an expenditure of \$200,000 with the total cost of the project for the chancery being \$400,000. That is in Ghana. In the case of Canberra we are anticipating an expenditure this year of about \$200,000 out of a total cost of \$270,000 for a residence. The same thing applies for a residence in Dakar where we expect to spend about \$100,000 this year out of a total cost of about \$265,000. At Islamabad there is a program for developing something a little more ambitious. This year the foreseeable expenditure is \$700,000 for a project the total cost of which eventually will be \$2 million. This involves the building of a chancery, a residence, and staff quarters. In New Delhi, as we mentioned a minute ago, this year there is an estimated expenditure of \$1 million on a total project of \$2.75 million. This will involve the building of a chancery and includes the site development. In Warsaw there is an expenditure of \$220,000 for this year out of a total of \$650,000 for the construction of a chancery. There are several other projects of various kinds in a number of other countries totalling \$300,000 and the estimated total capital expenditure for construction this year is \$2.7 million.

Mr. Thompson (Red Deer): I have another question that relates to capital costs under the item OECD. I notice that the capital costs remain fairly constant in the main item and yet under OECD in France we find an operational expense, again, of some \$64,000.

Mr. Cadieux: On what page is that?

Mr. Thompson (Red Deer): It is on pages 88 and 91 of the main estimates—page 88 for the

operational item under A, and page 91 a difference of some \$64,000 in this year's estimates.

Mr. Bennett: If I might explain, sir, the items shown on page 88 are the costs of Canadians seconded to the organization. We pay their salaries and we recover from the organization, as such. They would be on the staff of the organization. The items shown on page 91 are the operational costs of our delegation to the OECD. These are Canadians employed by the Department.

Mr. Forrestall: Are we paying them twice?

Mr. Bennett: No, they are different people. They are quite different people. The increase in the cost for OECD from \$190,000 to \$254,000 as shown on page 9, is a reflection of the increased cost of salaries and allowances that have been awarded by the Board.

Mr. Forrestall: This does not necessarily reflect an increase in staff.

Mr. Bennett: No, sir.

Mr. Forrestall: I wish they would give us raises like that.

Mr. Bennett: On the lefthand side of page 91 you will find a reduction in the numbers at OECD.

Mr. Thompson (Red Deer): I have just one more question. Now that our foreign service officers are being unionized and collective bargaining is being extended to these professional people, how does the Department contemplate this as it might relate to salary levels?

Mr. Cadieux: We have to adjust to the conclusions of the negotiations. Treasury Board has partaken in the negotiations which resulted in a contract covering a certain period. In this case it covers the period up to the fall of next year, 1970, so that some estimate will have to be made of what the costs and the increases are likely to be. Certainly the results of the last negotiations have been very satisfying as far as we can judge from the point of view of the officers in the Department and we expect that the impact on morale will be very good. The officers feel that the negotiations have been worthwhile and have resulted in an agreement that, as far as they are concerned, is satisfactory. I saw the Chairman and the Co-Chairman of

the Association after that meeting and they are naturally now giving thought to the other types of problems that they will raise in the course of the next round, but as far as they are concerned they feel that this has been a successful experience. They look back at the negotiations and the creation of the Association as something that has been indicated in their opinion.

The Chairman: I have called Vote 1. Some of the questions have related to Vote 1 and some to Vote 10. This indicates, perhaps, that it might be convenient to deal with both these votes at the same time and, indeed, we could deal with all three at the same time if this were the most convenient way of doing it.

Mr. Allmand: On a point of order. Since some of us only have this booklet and the votes are not divided up perhaps it would be better. There is only one vote in these books and it is hard to tell under what vote they come in your book.

The Chairman: Presumably Votes 1, 10 and 15 are all under the single vote.

Mr. Allmand: They are, but when asking questions we do not know under what vote they would come.

The Chairman: Under those circumstances would it be agreeable if I called all three votes? Questions then can be directed to any of these three votes.

Mr. Thompson (Red Deer): I have one short question that would be on another section if we are going to do that.

The Chairman: Could I just call the three votes and then we will proceed with you, Mr. Thompson. I will call Votes 10 and 15.

Department of External Affairs

10 Construction, acquisition or improvement of buildings, Works, Land, Equipment and Furnishings \$7,000,000

15 Grants as detailed in the Estimates and contributions in accordance with the terms and conditions specified in the sub-vote titles listed in the details of the Estimates, including authority to pay assessments in the amounts and in the currencies in which they are levied, and authority to pay other amounts specified in the currencies of the countries indicated, notwithstanding that

the total of such payments may exceed the equivalent in Canadian dollars, estimated as of January, 1969, which is \$18,957,800

(S) Payments under the Diplomatic Service (Special) Superannuation Act and Pensions \$50,000

(S) Credits to the Government of India under a financial agreement entered into between the Government of Canada and the Government of India to finance the purchase in Canada of aircraft and associated spare parts and equipment—not required for 1969-70

We will deal with questions on all three votes at the same time. These three constitute Vote No. 1 in the new form of estimates, do they not, Mr. Allmand?

Mr. Allmand: Yes they all are under Vote 1.

Mr. Thompson (Red Deer): My question relates to the United Nations, Mr. Chairman. Mr. Cadieux, we have been aware during the last few days that a number of the major countries including the United States, the United Kingdom and, I believe, Russia as well, have been calling for a holdfast on all expenditures at the U.N. with the exception of the percentage increase which has been agreed upon which, I think, is 3 per cent or something like that. I notice that our expenditure in the proposed estimates is up nearly 10

• 2040

per cent when compared with last year's. Would you care to comment on that?

Mr. Bennett: The provision we make in the estimates is based on an estimate of the ultimate size of the UN budget allocated according to our scale of contributions—the scale that is set by the UN itself for the contribution that will be made by Canada. It is necessarily made long in advance of the final decisions by the UN on the size of the budget. Therefore, it is subject to change when the final budget is set by the United Nations. This accounts for the special wording in the vote which allows us to pay the actual amount when it is paid, and these funds are not available to us for any other purpose. In other words, if the United Nations budget is set at a lower or higher level, we pay the precise amount according to our scale of assessment. This was our best estimate at the time it was made.

Mr. Cadieux: This is the view of the larger powers on the desirable ceiling of the United Nations budget. This is bound to be discussed in the course of the next General Assembly in the Fifth Committee (Administrative and Financial) where the views of many other countries will be brought to bear on this.

Mr. Thompson (Red Deer): Really what they are talking about now is 1970-71?

Mr. Cadieux: Yes, but as you will see, this will be a highly political question and the Canadian government will have to make a decision in relation to the vote there and the views it holds on the importance of the United Nations and the kind of line it wants to take in relation to what these big powers take and what other middle size countries, like Canada, or smaller countries, may want to take. How this will develop, I think, will be a factor that no doubt the Canadian government will take into account when making its decision.

Mr. Thompson (Red Deer): Thank you.

Mr. Cadieux: If the three powers say, "This is the figure"; that is not binding on Canada and how the other countries take it, I think, very much remains to be seen.

Mr. Allmand: Mr. Chairman, on page 12 of the new form Estimates under "Contributions" there is an item of \$500,000 for "Defence support assistance to Greece and Turkey", which is an increase from \$100,000 to \$500,000. What is that for; how much is divided between Greece and Turkey and why was it increased by that amount?

Mr. Cadieux: This is a forecast expenditure for the telecommunications link that I mentioned, I think, the last time I appeared before the Committee in December.

Mr. Allmand: For telecommunications?

Mr. Cadieux: A telecommunications link unless I am wrong. This was discussed, but I do not think there has been approval yet. It is still under consideration between the Canadian government and the governments of Greece and Turkey. There has been no decision yet on this; so unless there is an agreement, this sum may not be expended. It is there in case it is needed and in case there is an agreement. If it is spent, it is very likely going to be spent for that purpose.

Mr. Allmand: It has just been brought to my attention that in the Blue Book the figures

are different from those in the white book. In the Blue Book the figure for 1968-69 is \$1 million and 1969-70 is \$500,000; whereas, in the white book, the new form, it is \$100,000 for 1968-69 and \$500,000 for 1969-70. Which is correct?

Mr. Bennett: May I draw your attention to the fact that the heading in the white book is "Forecast Expenditure" in the past fiscal year. We have forecast that we would actually spend approximately \$100,000 on this project.

• 2045

Mr. Allmand: Yes.

Mr. Bennett: At the time the Blue Book was prepared, which was an estimate for 1968-69, provision was made for expenditure of \$1 million that, in effect, was not spent.

Mr. Allmand: Was spent?

Mr. Bennett: Was not.

Mr. Allmand: Was not.

Mr. Bennett: We actually expect to spend \$100,000 of the million that was provided in 1968-69.

Mr. Allmand: All right, very good. My next question relates to the item for the grant to the John F. Kennedy Centre for the Performing Arts. Is that a capital grant or is it a grant towards some particular function that took place there? There is an item of \$61,000.

Mr. Cadieux: It is a gift; I think it is a piece of equipment.

Mr. Allmand: A piece of equipment.

Mr. Cadieux: Yes.

Mr. Allmand: The last question I have relates to the item for "Information", which I see has increased from \$580,000 last year to \$1,552,000. Is this due to an expanded information program or is it due to merely increased costs on the same program?

Mr. Bennett: If I may answer that, sir, in the recent Re-Organization Bill that was, I believe, approved by the House, responsibility for the Canadian Government Exhibition Commission, which was previously carried in the Estimates of the Department of Public Works, was shifted to the user departments, if I can describe them that way. We have now been asked to make provision for the cost of the exhibits that will be prepared by the

Canadian Government Exhibition Commission on our behalf. This has added approximately \$800,000 to our information program which was previously carried in the estimates of the Department of Public Works for the Exhibition Commission. We now pay the Exhibition Commission for the work they do for us, previously we did not.

Mr. Allmand: That is all, Mr. Chairman.

The Chairman: Mr. Brewin.

Mr. Brewin: Mr. Chairman, could you read out the names that you have?

The Chairman: I have your name and I have Mr. Laniel, Mr. Forrestall and Mr. Roberts. I was calling on one from each party to start with. I am calling Mr. Brewin now.

Mr. Brewin: Mr. Chairman, I wondered if we could have an explanation of the item which is right next door to the item discussed by Mr. Allmand on page 12 of the white paper: "Defence support assistance to cover direct expenditures on behalf of countries not members of NATO...\$3,700,000", compared with a figure of \$3,100,000. I wonder if we could have an explanation of those items? Why the increase? My understanding was that at least one country, I think it was Uganda, had indicated they were not going to seek Canadian defence assistance. I take it this is a contribution to the defence forces of certain countries and I wonder if we could have an explanation of those items?

Mr. Cadieux: Yes, this covers a number of programs. I think the country you have in mind, Mr. Brewin, is Tanzania.

Mr. Brewin: Tanzania.

Mr. Cadieux: Yes, but I think they announced that after these Estimates were printed. The various programs covered are the Ghanaian program at \$228,000 and the estimate for the Tanzanian program was for \$3.2 million, but as I say, this was budgeted before they announced their decision.

Mr. Brewin: Three million dollars?

Mr. Cadieux: It was \$3.2 million for 1969-70.

Mr. Brewin: If they do not want the money, then we can save \$3.2 million?

Mr. Cadieux: The total estimate for the year was \$3.7 million for the military assis-

tance program. There is an *ad hoc* program that covers a number of countries: Jamaica, Kenya, Zambia and Malaysia. I think that these four countries receive *in toto* not more than \$300,000.

Mr. Brewin: What was the reason for Tanzania declining our support for their defence policy. I understand at one time we were competing with the Chinese to supply them with defence assistance; is that still the case?

• 2050

Mr. Cadieux: I prefer that you ask that question of my Minister because I think we get into a consideration of the motives of other governments and the reaction of the Canadian government.

Mr. Laniel: Mr. Chairman, could I ask a supplementary. It is on another item that comes under this support for defence.

[*Interpretation*]

I also notice an increase under the item "assistance to defence support services granted to Greece and Turkey". It is a fairly important increase of \$100,000 to \$500,000. Is this an individual engagement by Canada or is this part of a general program. Do the NATO countries contribute individually, according to agreements with Greece and Turkey, or is this decided at the NATO ministerial level?

Mr. Cadieux: A few years ago, NATO had recommended that its members give help to Greece and Turkey which had, and still have important military responsibilities. At that time, in keeping with this recommendation, Canada had proposed to Greece and Turkey a form of aid that would consist of liaison in the field of communications. Thus, a project was drawn up and it is expected that it may cost up to \$3 million. But the project has not yet been definitely approved by the Turkish and the Greek governments, and the amounts that are listed in the Estimates are sums that could be spent if the program were approved.

Mr. Laniel: They are directly connected to this communications program?

Mr. Cadieux: That's right.

Mr. Laniel: Thank you.

[*English*]

The Chairman: Mr. Brewin, had you finished with your line of questioning?

Mr. Brewin: Yes.

Mr. Allmand: I have a supplementary to Mr. Brewin's line of questioning.

The Chairman: Mr. Allmand on a supplementary.

Mr. Allmand: I recall reading an article in recent weeks which stated that Tanzania had made a request to the Canadian government for military aircraft. Do you know if that is correct?

Mr. Cadieux: I understand that this program between Canada and Tanzania is going to be terminated in January of 1970. There will be some expenditure this year but the program is not going to be continued. I think the reasons for this and the considerations that enter into it get us into a more sensitive political area, and that is why it is difficult for me to comment. The relationships between the Tanzanian government and other government is again a matter that I think it would be more appropriate for my Minister to comment on.

Mr. Allmand: Mr. Cadieux, I have found the clipping I was thinking about. It is a clipping dated April 11, 1969, and it is under the by-line of Mr. Patrick Best. It reads:

Tanzania is awaiting a firm reply from the Canadian government to a request for jet aircraft to help the young nation to defend its borders against incursions from Portuguese Mozambique.

Do you know about this request for military aircraft?

Mr. Cadieux: All I can say is that the present position is the decision of the Tanzanian government to terminate this five-year program. It is coming to an end in 1970 in any case, and it will not be extended. So, if there is any question of military aircraft, I do not think, unless there is a new request—

Mr. Allmand: It would appear to be a new one. This is dated April 11.

Mr. Cadieux: I am not aware of this. The latest information I have is a decision of the Tanzanian government not to extend the five-year program. It was commenced in August of 1965 for a period of five years, and it was to consist of an army component and an air wing component. Some people were going to be trained here and a school was going to be built in Tanzania, but this—

Mr. Allmand: Excuse me. This clipping goes on to say, and it may be completely false:

A top level exchange has taken place between the two governments on this question and the matter is now believed to be before Canadian External Affairs Minister Sharp.

This refers to the request for additional military aircraft.

Mr. Cadieux: I can only say that if there is a new request I am not aware of it.

● 2055

The Chairman: Mr. Stewart.

[Interpretation]

Mr. Stewart (Cochrane): Thank you, Mr. Chairman.

Mr. Cadieux, someone mentioned a while ago the gift to the John F. Kennedy Arts Centre. I would like to have more information about this. Is it a gift or...

Mr. Cadieux: Yes, if I understand correctly, the Canadian Government has decided to make a gift to the John F. Kennedy Centre.

Mr. Stewart (Cochrane): Is there any special reason? Is it as a memorial on the part of Canada? Are there any maple leaves on it, or what?

Mr. Cadieux: I think quite a few countries have made contributions. I think I have a note about what different countries have given. On the other hand, we also have a National Arts Centre here, and I believe that other countries have offered contributions to Canada. It is an exchange of friendly services between countries. It is a sort of international compensation, if you wish.

Mr. Stewart (Cochrane): When you make gifts to an arts centre, do you first consult the Secretary of State?

[English]

Mr. Bennett: Yes, sir. The gift is in the form of a curtain for the stage. There was close cooperation with the National Arts Centre and I understand the design for the curtain came about as a result of a competition between Canadian artists. I am not absolutely certain of this. The curtain is being made for the Centre as a memorial.

[Interpretation]

Mr. Cadieux: The countries that have made gifts to the Centre are Denmark, West Ger-

many, Japan, Norway, Sweden, Ireland, Italy in addition to Canada.

As far as the procedure that was followed in the choice of the Canadian gift, I unfortunately do not have that information here. I cannot tell you how one proceeds.

Mr. Stewart (Cochrane): By the way, it is interesting to note that the curtain cost \$61,000, since ours here in Ottawa, will be costing \$93,000.

You mentioned a while ago the scholarships that are included in the amount of approximately \$2 million.

Mr. Cadieux: For cultural relations.

Mr. Stewart (Cochrane): You have mentioned scholarships given to Belgium and to other countries. Are these scholarships given to students of these countries, to Belgium, for instance?

Mr. Cadieux: Yes.

Mr. Stewart (Cochrane): Not to Canadians who are in those countries...

Mr. Cadieux: No.

Mr. Stewart (Cochrane): ...but to Belgians.

Mr. Cadieux: To Belgians, Frenchmen, Swiss. But it must be kept in mind that the governments of these countries often offer scholarships in return to Canadians. I believe that this scholarship system is administered for the Department of External Affairs by the Canada Council.

Mr. Stewart (Cochrane): Do we give more than we receive, or—

Mr. Cadieux: I think what we give and what we receive is about the same.

Mr. Stewart (Cochrane): There is also another topic I wish to deal with. A little while ago, we gave a special form of aid to Biafra. Would it be under the Canadian International Development Agency, or does that concern us here, this evening?

Mr. Cadieux: I will ask my colleague, Mr. Riddell, who is an expert on Biafra, to answer this question.

• 2100

The Honourable Member asked whether the help we gave to the Red Cross comes under the budget of our Department?

Mr. Riddell (Chief, Central Eastern African Division): No, Mr. Chairman, assistance to Biafra and Nigeria comes under the CIDA.

Mr. Stewart (Cochrane): Thank you. I think I would like to have more information about one certain topic about which there are certain rumours that are not true and which may be detrimental to your external relations. For instance, I have been told that when you expect a surplus of money as far as travelling appropriations are concerned, a few months before the end of the fiscal year, you find means of spending that surplus by sending people around the world. Could you make any comments about this?

Mr. Cadieux: It is certainly not the case.

These trips have to be justified. The agents who carry out these trips have to do so in terms of appropriations earmarked for certain departmental services. Therefore, a service that has already or almost used up its funds, could not carry out another trip of this nature. Before undertaking a costly trip, each service has to ask for authorization from the financial services. In some cases, Senior Officers in the Department exercise a certain amount of control. And the concern of Departmental Officers is similar to that of the various financial administrations and of the government, i.e. to carry out their functions in the most economical way possible. There is no point in having Officers travel just for the pleasure of it. Furthermore, the Departments which would do such a thing would be the first ones to be penalized, because Officers are always limited in number, and when they are absent, those who are left have to do the work with less staff. Therefore, it is not in their interest to let them go, or if they have to let them go, they do so for the shortest possible time.

Mr. Stewart (Cochrane): It's a good thing to clear this up, because we hear about that in the Public Service.

Mr. Cadieux: Moreover, I think during the last year we did not have enough money available in the appropriations for travelling. And we have had to transfer additional money from other items to cover all our expenses in that field.

Mr. Stewart (Cochrane): Another thing which is perhaps not well understood by MPs in general and by the public at large, is the question of the building of residences and

legations abroad. I have had the opportunity of seeing what the situation is in a number of countries, and I know that it is to our advantage, and that it is even more economical to build these residences. Could you explain that?

Mr. Cadieux: Certainly. I shall tell you about some of the things to be considered in this matter. The advantage of having your own residence is the same as that enjoyed by a private citizen has when he buys a house instead of renting it. When you rent you have to pay rent but after doing so for years and years, you have nothing. Whereas, if you can make the necessary investment, you have your own house and of course you benefit from such a situation, because otherwise you have nothing left after a given number of years.

Another advantage is that if you buy or if you build a house, you have a building that corresponds to your needs, so that you can carry out your work more efficiently. A third advantage of residences and legations built according to your needs, is that you can project an image of Canada abroad. You are promoting Canada. It is not always very easy to give an idea of Canada simply through architecture or the furniture but I can assure you that the architects used by the government try by all means to give the best possible image of Canada through the buildings they construct. This is not something that you can do if you move into an empty building that is large enough to house your services. So, for various reasons, i.e. finances in the first place, then efficiency, and giving a good

• 2105

impression of Canada in foreign countries, to the extent that we have means to do so, we have an advantage in having our own buildings. Another thing, when you install people in charge of missions and your staff in temporary quarters, you must keep in mind that in a good many countries it is not always that easy for them to find what suits them and to move from one place to the other. In the end, you must also ask yourself whether it is economical for the government to have a head of mission and his senior officers looking about anxiously every two or three years for other buildings then correspond with Ottawa

to obtain the necessary authorization, have officers' time taken up with this, briefly, spending a good deal of their time moving from one place to another without ever living decently. Moreover, while they are doing that, they cannot pursue the main objectives the government has set for them in the foreign countries. It does not seem very reasonable to me to spend three or four hundred thousand dollars to send a team to a given country and have them looking for buildings and houses every two or three years. It is much better, if we can afford to do so, to have them settled in a good legation, in a good residence. And once that is done, they can concentrate their energy towards achieving the actual goals set for them abroad, and not waste their time on matters that are really of minor importance.

[English]

Mr. Stewart (Cochrane): Thank you. Mr. Chairman, I only have one more question which I would like to ask and it has to do with bilingualism within the service. As one of our aims is to project Canada's dual culture abroad, I assume your program of bilingualism is one that will ensure within a reasonable time that all foreign service officers are bilingual. In this correct?

Mr. Cadieux: We are doing the very best we can to pursue this. As a Department we have an interest in doing this, not only because I think it is the wish of the country but there is a professional advantage in doing it. French and English are two of the great international languages, so professionally there is an incentive to do what we can to get our people to learn these two languages.

I have some figures here concerning officers which I think are interesting, but there are other figures as well. These figures relate to people who join the service at the officer level. In 1966 out of 54 new foreign service officers 23 were bilingual, so that is a good start. If half of your officers are already bilingual when they join the task of teaching the other official language is made relatively easier. In 1967, when 57 foreign service officers joined us, 36 were bilingual. In 1968 there were 14 out of 22 who were bilingual. I think there were some tests made a few years ago. Unfortunately the testing technique is perhaps not as perfect as we would like it to be

but, such as it was a few years ago and such as it is today, this is what it reveals. In 1963 a survey showed that the percentage of bilingual officers in our Department was 29 per cent. This test was applied to the people in Ottawa—which is about 58 per cent of the officers, and the reason we only applied it to the people in Ottawa is because it is only in Ottawa that we have the facilities to apply the test—and the present figure is 48 per cent. So, it shows a fairly substantial advance from 1963 to 1969. Perhaps it was not as low as 29 per cent in 1963 and it perhaps may not now be as high as 48 per cent, but I think there has been a good increase. As you can see from the figures relating to those who joined the service and the indications that we have as a result of the test, at the moment it is around 50 per cent so far as officers are concerned.

On top of that, we are really making a very serious effort to first send the young officers to learn the other language and then we deal with the senior officers as soon as we can and as often as we can. We send them on these immersion courses for a year to learn the other language. The difficulty here is the operational requirement. There is a point at which it is not possible to release an officer because the Department or a section thereof would really break down if the officer went away, but compatible with the operational requirements of the Department we are making every effort to release them.

● 2110

Mr. Stewart (Cochrane): With regard to these new recruits, they have two years of training in Ottawa?

Mr. Cadieux: Yes.

Mr. Stewart (Cochrane): Do you insist they become bilingual within those two years?

Mr. Cadieux: Yes, sir.

Mr. Stewart (Cochrane): For example, do you say, "You do not go abroad until you are bilingual"?

Mr. Cadieux: The first thing they do is learn the other language. This is the first requirement. Then we train them in the procedures of the Department. We teach them the job and then we prepare them for their

assignment, but first they must learn the other language if they do not know it.

Mr. Stewart (Cochrane): There is a little criticism that I would like to level, if you do not mind, Mr. Cadieux. It seems to me that the first of our foreign posts that should have bilingual officers are the ones that deal with French-speaking countries and I have noticed that there are some foreign posts where the ambassador, or the other people who visit other French-speaking countries, are not in fact bilingual.

Mr. Cadieux: I know.

Mr. Stewart (Cochrane): Can this not be corrected?

Mr. Cadieux: We are doing our best to correct this.

Mr. Stewart (Cochrane): In Africa, for example.

Mr. Cadieux: Yes. At the moment we do not have enough to go around. This is the difficulty. We are trying to spread them out and as we open new missions it puts a terrific strain on our resources. We do not have enough. We need a type of worker for certain divisions at headquarters who is particularly concerned with la francophonie and liaison with the provinces. These are divisions where a knowledge of the two languages is almost essential. You have to keep those people here and you must deduct the ones who are in the process of learning French and there are also some anglophone posts where you want to assert your principle of bilingualism. Take a country like Australia or the City of London; if you send a good bilingual person to London or to Australia it is not possible to say whether he will speak French very often, but I think it is important for the country to send a young man like Mr. Hardy to a place like London or to send people such as Mr. Charpentier to a place like Australia. They go there and among other things, if they are French Canadian learn a great deal about the Commonwealth and just by being there they advertise the fact that Canada has French Canadians. What does that mean? It means that if you have a post in Tunisia you may have great difficulty in finding a French Canadian for your number two or your num-

ber three. Why? Because he is in London or in Australia. We have these conflicting requirements and that is why the more we have the more we can train and the easier it will be, but it takes a little time to do this.

The Chairman: Gentlemen, I am afraid I will have to adjourn this hearing because of the votes. We will have to make arrangements for Mr. Cadieux and his assistants to return at some future date because I do not

think we will be back in time to complete our work this evening. I still have a fair number of questioners and I assume it would take too long. Mr. Cadieux. So, on behalf of the members of the Committee I would like to thank you. I am sorry we have had to break it off, otherwise we could have perhaps finished this evening. We will be in touch with you to arrange another time.

Mr. Cadieux: Fine. Thank you.

The Queen's Printer, Ottawa, 1969

HOUSE OF COMMONS

First Session—Twenty-eighth Parliament
1968-69

STANDING COMMITTEE
ON

EXTERNAL AFFAIRS and NATIONAL DEFENCE

Chairman: Mr. IAN WAHN

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 39

TUESDAY, APRIL 29, 1969

Respecting

Estimates, 1969-70, Canadian International Development Agency.

WITNESS:

(See Minutes of Proceedings)

STANDING COMMITTEE ON EXTERNAL AFFAIRS
AND NATIONAL DEFENCE

Chairman: Mr. Ian Wahn

Vice-Chairman: Mr. Perry Ryan
and Messrs.

Allmand	Groos	Marceau
Anderson	Guay (<i>St. Boniface</i>)	Nesbitt
Barrett	Harkness	Nowlan
Brewin	Howard (<i>Okanagan</i>	Penner
Buchanan	<i>Boundary</i>)	Prud'homme
Cafik	Laniel	Stewart (<i>Cochrane</i>)
Carter	Laprise	Stewart (<i>Marquette</i>)
Fairweather	Legault	Thompson (<i>Red Deer</i>)
Forrestall	Lewis	Winch—(30)
Gibson	MacLean	

(Quorum 16)

Hugh R. Stewart,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

TUESDAY, April 29, 1969
(59)

The Standing Committee on External Affairs and National Defence met at 11:05 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Anderson, Barrett, Cafik, Fairweather, Forrestall, Guay (*St. Boniface*), Howard (*Okanagan Boundary*), Laniel, Laprise, Legault, Lewis, Nowlan, Penner, Prud'homme, Ryan, Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch—(20).

Witness: Mr. M. F. Strong, President, Canadian International Development Agency.

In attendance: The Honourable Senators Aird (Chairman), Grosart, Laird and Quart, Members of the Standing Senate Committee on Foreign Affairs; Mrs. Ruth Masika, Uganda, training under the C.I.D.A. program; Mr. Kasem Gulek, Member of the Turkish National Assembly and President, North Atlantic Assembly.

The Chairman welcomed members of the Senate Committee on Foreign Affairs and introduced Mrs. Masika and Mr. Gulek.

The Committee resumed its consideration of the Estimates 1969-70 of the Department of External Affairs.

The Chairman introduced Mr. M. F. Strong, President of the Canadian International Development Agency. Mr. Strong made a short opening statement introducing his audio-visual presentation on Canadian external aid policies and programmes.

Items 1, 10 and 15 of the Estimates were allowed to stand.

The Chairman called the Items pertaining to the Canadian International Development Agency, namely Item 30, *Salaries and Expenses*, \$5,765,400, Item 35, *Grants etc.*, \$171,404,000 and Item L35, *Special loan assistance etc.*, \$137,000,000.

Members of the Committee questioned Mr. Strong. Mr. Thompson requested a statement of external aid allocations and expenditures for the past ten years and Mr. Nowlan requested a statement showing the relative performance of other D.A.C. countries. The Committee agreed to print this information, to be provided by Mr. Strong, as an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix WW*)

At 12:55 p.m., with the questioning continuing, the Committee adjourned until 3:30 p.m. this day.

AFTERNOON SITTING
(60)

The Standing Committee on External Affairs and National Defence met at 3:35 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Cafik, Fairweather, Forrestall, Gibson, Harkness, Howard (*Okanagan Boundary*), Laniel, Legault, Lewis, Marceau, Nesbitt, Nowlan, Prud'homme, Ryan, Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch—(18).

Witness: Mr. M. F. Strong, President of C.I.D.A.

Mr. Strong introduced the officials of C.I.D.A. who were present and Members resumed their questioning.

Members received copies of the transcript of the audio-visual presentation made during the morning sitting, binders containing information about Canadian External Assistance Programs (April 1969) and copies of the C.I.D.A. Annual Review 1967-1968.

At 5:15 p.m., with the questioning continuing, the Chairman thanked Mr. Strong and the Committee adjourned until Thursday, May 1, 1969 at 11:00 a.m.

Hugh R. Stewart,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

Tuesday April 29 1969.

The Chairman: Ladies and gentlemen, could we come to order, please. It is particularly pleasant today to have with us the members of the Senate Committee on External Relations and its Chairman, the Hon. John B. Aird. The Senate Committee is currently investigating all facets of Canada's relations with the Caribbean area. It is particularly interested in Canada's external aid policies and programs relating to that area.

Hon. Senators, we are very happy indeed that you could be here this morning. I would also particularly like to mention that we are happy to have with us this morning, Mrs. Ruth Masika from Uganda, who is training under this aid program. Perhaps you would stand up, Mrs. Masika, so that they can see just where you are.

I would also like to draw the Committee's attention to the presence at these hearings of Mr. Kasem Gulek. Mr. Gulek is a member of the Turkish Grand National Assembly and is this year's President of the North Atlantic Assembly. Mr. Gulek is visiting Canada for several days in his capacity as President of the North Atlantic Assembly at which the Canadian Parliament is represented annually by a delegation. Mr. Gulek is here today as a guest of Mr. Perry Ryan, our Vice-Chairman who was former Chairman of the Canadian delegation to the North Atlantic Assembly. Mr. Gulek, we are honoured to have you here and hope that our proceedings will be of interest to you.

Today the Committee has as a witness Mr. Maurice Strong, President of the Canadian International Development Agency. He has appeared before the Committee on previous occasions and I am sure no further introduction is necessary.

Mr. Strong has arranged for an audio-visual presentation on Canadian external aid policies and programs to be made for the Committee and for the members of the Senate Committee. I understand there will be four 15 minute projections, perhaps with a short

break between each. Each completes in itself particular aspects of external aid. That will take about an hour in all.

Afterwards, Mr. Strong, will be happy to answer general questions from anyone here. Possibly by the time those general questions are over it will almost be time to break for lunch. In that event, the members of the House of Commons Committee will meet again this afternoon to go over the details of the estimates.

With that I think, Mr. Strong, I will turn the meeting over to you.

Mr. M. F. Strong (President, Canadian International Development Agency): Thank you very much, Mr. Chairman, hon. members, hon. senators. I will waste very few words and very little of your time this morning in introducing this subject. I would like to give you a word of explanation as to what we are doing here this morning.

We had a problem of trying to relate to you in a very meaningful way the story of external aid and the story of the activities of the Canadian International Development agency which are the subjects of the estimates you will be reviewing. To do this within a very short period of time, and to make the best use of that time, we decided to spend a lot of our own time in putting together that story using the latest audio and visual techniques. In this way we will try, in one hour, to give you more information on our program than would be possible to present in the same amount of time by, your simply listening to me relate it to you from this forum.

• 1110

The voices you will hear will be my own voice—so that I am in effect making this report—and, on occasion, you will hear another voice. I was advised by my technical advisers that to hear my voice continuously for an hour would create a certain monotony. I agreed with that after I heard it. Therefore, you do hear another very rich voice, that of Father Harold Oxley, who is also the man in charge of the technical presentation itself.

It involves a great deal of time, effort, and work by our staff. This is an experiment and we hope it is an experiment which will have the kind of results that we intend it to have; namely, to give you a great deal more information and a great deal more insight into our program than would otherwise be possible. With that, gentlemen, ladies and gentlemen, I would turn this meeting over to Father Oxley and our technical people who will take it from here.

(Audio presentation follows)

Mr. Chairman and Gentlemen, in presenting this report on Canada's Development Assistance Program, I would first like to refer to some of the factors which provide the broad background for our concern and our activities.

We will be speaking today on what are called the world's less developed countries.

First, let us look at what we mean by that term.

From an economic point of view, we mean countries with an annual per capita incomes of less than \$500.

Of 115 countries listed by the World Bank as having populations of one million or more, 77 are less developed.

But two-thirds of the world's population live there.

Twenty-nine countries have per capita incomes of \$100 or less. Some are as low as \$40.

The poorest continent in the world is Asia; it is also the most populated. One billion, seven hundred and forty million people with a per capita income of about \$100 per year.

The average per capita income in the less developed nations, as a whole, is about \$145 per year. In the past two years alone, the average per capita income of Canadians has increased by more than \$180.

And so the gap between the rich and the poor continues to widen. In the field of trade, 70 per cent of the world's exports now come from the developed countries, leaving only 30 per cent to be shared by the less developed majority.

The developed countries are increasing their trade with each other more rapidly than with the less developed countries.

Even their sales to less developed countries are increasing more rapidly than their purchases.

And the terms of trade continually worsen for less developed countries.

The prices they receive for their exports, principally commodities, have declined, while the prices they must pay for the manufactured products they import, have arisen.

Undoubtedly, improved trade conditions are imperative, and some progress is being made—albeit slowly—towards international agreements for granting preferences to imports from less developed nations and to commodity agreements covering some of their principal exports. But there are limits to the assistance the less developed nations can expect to derive from these measures.

In the meantime, they continue to need other types of aid too; economic, educational, and technical. They need the help of people, as well as of capital assistance. Mr. Paul Hoffman, Administrator of the UN Development Program, has said that within the last 18 months, no more than 25 low-income countries of the world have reported achieving the 5 per cent increase in their gross national products, established as a minimum development goal.

• 1115

He adds: "Growth in production, particularly food production, barely kept pace with population growth. Industrial output, export earnings, employment opportunities, school enrolments and many other key indicies of progress generally failed to show adequate upward trends."

And U Thant, Secretary-General of the United Nations, in the spring of 1968, highlighted this crisis when he said: "The most urgent conflict confronting the world today is not between nations or ideologies, but between the pace of growth of the human race and the insufficient increase in resources needed to support mankind in peace, prosperity and dignity..."

"With the current unsatisfactory growth of resources, the world will become more hungry, more crowded, more pressed in every sense. Half of those now living and two-thirds of those still to be born in this century face the prospect of malnutrition, poverty, and despair."

In 1960, the world population was about 2,998 million by the year 2000 it will have risen to about 6,130 million.

The population of the less developed countries is increasing at annual rates almost

twice as high as those of the developed world. Today, 2 out of 3 of the world's population live in the less developed regions; by the year 2000, it will have risen to 4 out of 5.

Despite substantial growth in food production and education, there are more hungry people, more illiterate people, in the world today than ever before in history.

The scale of the needs is too vast and the crisis that looms is too grave and far-reaching to enable solutions to be worked out in a purely local or even a national context. It is an international problem and must be tackled internationally. Canadians will be deeply affected by the consequences and must be involved in the solutions.

There is no doubt that the less developed countries need assistance. But can the assistance really benefit them? To what extent can it really help?

We cannot hope to close the economic gap between the rich and the poor countries. At least, not in our lifetime. But we can eliminate that dire poverty which condemns so many millions of people to live under conditions that are an affront to humanity.

And we can do a good deal to help improve generally the quality of life for the world's less fortunate people.

We can work towards the establishment of a world society where all people have a more equitable share of the benefits which modern science and technology now make feasible.

Aid programs really represent the first primitive steps in this direction.

Canada's aid program cannot, in itself, provide a total response to this problem. But it can make a vitally important contribution to the collective effort of the wealthy industrialized nations to help the less developed nations achieve their aspirations for better standards of life.

Ninety per cent of the world's development assistance comes from 16 countries linked in The Development Assistance Committee, which we call (DAC) for short, of the Organization for Economic Cooperation and Development, which we refer to as OECD. Canada is one of these countries.

The total flow of DAC assistance has increased slowly but steadily since 1962. But it still represents only about \$11.50 per person per year for the people of the DAC member

countries. And that must be spread over some 2,400 million people in the less developed countries.

As a percentage of gross national income, the flow from DAC countries has declined since 1962. In 1961 the average was 1.2 per cent of their combined national income; today it is 0.9 per cent.

In relation to national income, the net flow of official aid to less developed countries has been slightly declining for most of the major developed donor countries, while the flow from smaller countries has been increasing.

The average unofficial aid flow from all of the DAC countries is 0.57 of 1 per cent of their combined national product.

Present evidence points to a levelling off in the amount of international development assistance. Its value in real terms has been subject to continued erosion while its contribution to development is frequently impaired or offset by other factors:

First, the debt-service burden incurred through previous loans now amounts to over \$3.5 billion a year and is growing.

Second, the drop in prices for some of the primary products on which they depend for a major portion of their export earnings.

Third, the tying of aid which sometimes increases the price of goods purchased under aid programs by 10 to 40 per cent.

But the facts are not all discouraging. The economies of the newly independent developing nations, as a whole, have grown at a rate more than double their pre-independence per-

• 1120

formance. The world bank estimates that 15 of the world's less-developed countries could become economically independent of external assistance within the next 10 or 15 years. A number of other are showing economic growth rates exceeding the average of industrialized nations.

Science and technology has made available promising new tools and techniques for dealing with some of the most difficult development problems, including the production of food.

In this context, let me now refer to what Canada is doing. I will first outline the present scope and dimensions of our aid program.

Significantly, during the past year the name of our office was changed from the External

Aid Office to The Canadian International Development Agency, and we will refer to it as CIDA throughout the remainder of this presentation. As you know, the Agency reports to the Honourable Mitchell Sharp, Secretary of State for External Affairs, who is the Minister responsible for the Canadian development assistance program.

The new name reflects more clearly our basic objective, to help the less developed nations with their own efforts to develop their economic and social potential for the benefit of their people.

Our business is development, and international development is a cooperative process, not a giveaway program.

Our aid program began in 1950, when Canada became one of the founding members of the Colombo Plan for the development of the newly independent Commonwealth nations of South and Southeast Asia.

Since then, about \$1 billion of Canada's bilateral assistance has been channelled through the Colombo Plan, \$126.3 million of it during the last fiscal year.

In 1958, a program of Canadian assistance to the Commonwealth Caribbean was introduced.

In the past 10 years, about \$81.5 million has been allocated for that program, over \$22 million of it last year.

The Commonwealth Caribbean, in fact, today receives more Canadian aid on a per capita basis than any other area of the world.

In 1959, Commonwealth Africa was included in Canada's aid program for the first time, and in 1961, a special program was initiated for Francophone Africa.

The total allocation for Commonwealth Africa has amounted to over \$95 million so far, \$25.7 million of it last year.

In Francophone Africa the total since 1961 has amounted to nearly \$57 million, \$23.8 million of it during the 1968-69 fiscal year.

This today is our fastest growing program.

Since 1964, Canada's aid program has included assistance to Latin America.

\$10 million were allocated in each of the past five years for projects administered on our behalf by the Inter-American Development Bank.

Canada's allocations for external aid in the 1968-69 fiscal year amounted to \$298,908,000.

Of this, \$234.9 million was for bilateral assistance and \$61.8 million was provided through multilateral agencies; principally, the United Nations Agencies, the World Bank Group, and Regional Development Banks.

In calculating the overall amount of external aid provided, we also include loans made to the less developed nations under the Export Credits Insurance Act, less the amounts repaid on loans previously made, as these amounts are included in the figures used by the Development Assistance Committee in reporting comparative aid flows on an international basis.

Estimated commitments 1968-69, by the Export Credits Insurance Corporation for the fiscal year 1968-69 are almost \$13 million, which would make the total aid budget some \$301,630,000.

Apart from export credits, Canada's bilateral aid to developing countries is encompassed under two programs: the International Development Assistance Program, covered by External Affairs Vote 35, and the Special Loan Assistance Program, covered by External Affairs Vote L35.

• 1125

The administration of these programs is covered by External Affairs Vote 30.

External Affairs Vote 35 includes grants for economic, technical, educational, and other assistance detailed in the Estimates. In fiscal year 1968-69 Vote 35 amounted to \$153,747,000.

This includes \$69 million allocated for the international food aid program, \$200,000 for International Emergency Relief, and \$5 million in CIDA grants allocated for non-governmental organizations.

Vote L35, the Special Loan Assistance Program, last year amounted to \$106 million and the Administration Vote, External Affairs Vote 30, totalled \$4,003,000.

For the fiscal year 1969-70, Parliament has been asked to appropriate additional amounts. Details can be found on pages 101-103 and page 462 of the Estimates for the Fiscal Year Ending March 31, 1970. The International Development Assistance Programme, which is covered by External Affairs Vote 35 and which consists entirely of grants, includes \$70.6 million for economic, technical, educational and other assistance, \$70 million for food aid, \$24 million for contributions to international organizations, \$300,000 for inter-

national emergency relief, and \$6.5 million for contributions to non-governmental organizations. The total amount of the vote is \$171 million, an increase of \$18 million compared to last year.

The Special Development Assistance Loans Program is covered by vote L35. It amounts to \$137 million, compared to \$106 million last year.

In addition, Parliament has authorized the Government to make advances to the International Development Association and to the Asian Development Bank. They will total \$29.7 million during the course of the current fiscal year.

In summary, apart from Export Credits which the DAC includes in its calculation of aid flows, total Canadian assistance to developing countries in 1969-70 would amount to \$338.14 million.

Canada endorsed the 1961 resolution to the United Nations calling for the supply of government and private aid flows to total 1 per cent of the gross national income of donor countries.

Canada has also agreed to work towards the target, as revised in 1968 by the United Nations Conference on Trade and Development (which we call UNCTAD), of 1 per cent of gross national product at market prices which is more than 33 per cent higher than the previous target. In the last comparative figures released by the development assistance committee, which calculates aid on the basis of actual disbursements as distinct from allocations, Canadian official aid amounted to \$213 million in 1967 or 0.50 per cent of 1 per cent of national income.

In *absolute* terms we ranked sixth among the DAC countries, and *relative* to national income, eighth.

We compare somewhat less favourably if private flows are included—seventh in *absolute* terms and thirteenth in relative terms.

Canadian bilateral aid is heavily concentrated in 10 countries or areas which account for about 75 per cent of our total bilateral aid allocations.

These are:

In the Colombo Plan Region of Asia, India, Pakistan, Ceylon and Malaysia.

In Commonwealth Africa, Nigeria and Ghana.

In Francophone Africa, Tunisia, Cameroon and Senegal.

And the Commonwealth Caribbean area taken as a whole.

In total, some seventy-two countries or territories received some aid from Canada in the last fiscal year, but in most of these countries it was confined to small contributions in the field of education and technical assistance.

There are several important characteristics of our bilateral aid program which should be borne in mind. As you are aware, our aid program is concentrated in those areas in which we feel that Canada has special interests and where Canadian resources can best contribute to development.

Our aid is basically responsive in nature. But this does not mean that we wait passively for requests to be made. The best projects arise out of a continuing process of consultation and communication between CIDA and the developing countries concerned. This policy of creative cooperation increases the likelihood that our aid will be as effective and well directed as possible.

• 1130

Also, our bilateral aid is used primarily to provide Canadian goods and services to the developing countries. In the past, we required that goods supplied under the aid program have a Canadian content no less than 80 per cent. This percentage was recently reduced to 66⅔, which permits a much wider range of Canadian goods to be supplied under our program. Also, under certain circumstances, up to 25 per cent of our contribution to a development project may be used to cover local costs normally borne by the recipient country.

Let me now review the program itself in greater detail beginning with the provision of education and training in Canada to people from the less developed countries.

There are now about 2,073 students and trainees from less developed countries studying in Canada, in educational institutions and with industrial firms and other private and governmental organizations.

We offer several types of scholarships: University undergraduate, graduate, and post doctorate courses, one and two year trade and sub-professional programs at the post-secondary school level; and special courses of shorter duration in such important areas as public administration.

CIDA arranges too for the training of students whose visits to this country are

sponsored by the United Nations and its agencies, or other international groups or donor countries.

Sixty-six such students arrived in Canada this year.

We are presently taking a hard look at our training program. It is often less costly and more useful to provide education and training in the developing country itself, or in another country in the region where conditions are similar to those in the home country of the student or trainee.

Recently we initiated a program of third country training in which students from developing countries are sponsored by Canada to study in other less developed countries which offer courses unavailable in their home lands.

For example, 35 students from the Caribbean islands are now studying at the University of the West Indies under CIDA sponsorship.

Post graduate scholarships are also offered through the Commonwealth Scholarship and Fellowship Plan, which provides for an exchange of students within Commonwealth.

Canada had 250 such students last year.

The counterpart to receiving students and trainees into Canada is to send Canadian teachers and professors to less developed countries to assist in their educational programmes.

There are now over 700 Canadian teachers or professors serving overseas under our program.

It is generally understood between Canada and the recipient country that these teachers or professors should, as soon as possible, be replaced by properly trained local educators. And this of course is one of the principal objectives of our Program.

This explains our growing need for teacher trainers rather than line teachers.

The educational assistance that less developed countries have been receiving has increased the number of their secondary school graduates and created a corresponding need for help at the university level. And this in turn has led to experiments in teaming Canadian universities with those in less developed countries in the development of particular courses and facilities.

The University of British Columbia teamed with those of Malaya and Singapore in 1961

to establish courses in accounting and business practice. Since then, several other similar programs have been initiated.

CIDA's Technical Assistance Program also sends Canadian experts to developing countries to carry out specific assignments of a professional and technical nature.

There are now some 250 such people in the field under CIDA auspices.

Recently, we have been shifting towards a team approach to advisory assistance, and a greater involvement of Canadian institutions in comprehensive projects designed to provide the country concerned with a capability of its own to meet a specific high priority development need.

• 1135

For example, a team of experts from the Ontario Hydro-Electric Power Commission was supplied to the Niger Dam Authority in Nigeria to train personnel for the Kainji Dam, 300 miles north of Lagos.

The team will help to set up the power plant there and to run it with 100 Nigerians until an additional 200 Nigerians complete a three year training program to qualify them for senior line positions.

In our advisory program, we co-operate closely with the multilateral organizations, particularly the United Nations and its Agencies.

In any given year, there are at least 250 Canadians serving with multilateral agencies, many of them recruited through our Advisors Division.

Educational and Technical assistance represent a considerable portion of our total aid program in every area of Canada's concentration.

In the Colombo Plan area, it amounts to about 10 per cent of our total allocations.

In Commonwealth and Francophone Africa, it accounts for about 50 per cent of current allocations.

In the Commonwealth Caribbean, Educational and Technical assistance represents about 25 per cent of total allocations.

In Latin America, we have not yet introduced a specific program of Educational and Technical assistance, but we expect to introduce such a program shortly.

Let me now discuss what is referred to in the estimates as our economic assistance program beginning with food and commodity aid.

The combination of a rapidly increasing world population, and an inadequate supply of essential resources, has made this an important aspect of our aid program.

Food aid can only be a temporary palliative, but an essential one, when people are starving, as they were in India and Pakistan last year.

The provision of food aid also contributes to long-term development, as it frees scarce foreign exchange to enable recipient countries to direct their resources to programs and projects designed to deal with the underlying causes of under development.

The supply of other basic commodities has a similar impact and enables the capacity of existing industries in the country to be more fully utilized.

Food aid will continue to be a necessary ingredient in the Canadian aid program, but the need for it is likely to diminish in the next few years.

The countries to which Canada regularly gives food aid are India, Pakistan, and Ceylon.

Last year, the food aid allocations to India amounted to \$40 million, to Pakistan, \$5 million, and to Ceylon, \$2 million.

In the past five years, besides the three countries just mentioned, Canada has also given food aid to approximately twenty others.

The Food Aid Convention, which forms part of the International Wheat Agreement, provides for annual shipments of 4.5 million tons of food grains as aid to less developed countries.

Canada's share in this will amount to approximately 1.5 million tons of grain over a 3 year period.

Also, through the World Food Program and the UN Relief and Rehabilitation Agency, Canada gave \$9,365,300 in food aid last year.

Canada's commodity aid since its inception in 1951, amounted to \$243,810,000.

Last year the total was \$56.5 million, about 15 per cent of that year's total allocation.

Among the principal commodities shipped by Canada are: fertilizer, sulphur, copper, nickel, aluminum, and newsprint.

Almost a quarter—some 22 per cent in fact—of Canada's bilateral aid is provided in the form of capital assistance.

In total, during 1968-69, Canada undertook to help finance 243 new capital projects estimated to cost \$157.275 million. We continued our assistance to 276 projects carried over from the previous fiscal year, and valued at \$344.4 million. We completed 240 projects, the total cost of which was \$137.36 million.

Now entering fiscal year 1969-70, we are continuing our financial assistance to 279 capital assistance projects carried over from last year, and estimated to cost in total \$364.315 million.

These projects were designed to meet needs in such fields as agricultural developments, provision of educational facilities, electric power generation and transmission facilities, health and social services, communications, transportation, and resource development.

In India for example, Canada has allocated over \$44 million dollars to two large power projects, one at Kundah in Madras state, the other at Idikki in Kerala state.

We are also financing a significant long term agricultural program in India which resulted from the work of a special agricultural task force sent out to India about a year and a half ago.

One of the highlights of our program in Pakistan last year was the inauguration of a Thermal Generating Plant at Sukkur designed by Canadian engineers, built and equipped at a Canadian cost of \$13 million dollars.

Road construction, housing, airport development, lumber processing, and hospital and school constructions have all been among the projects financed through Canadian aid to the Colombo Plan area.

● 1140

In Vietnam, Canada has agreed to construct, equip and staff a rehabilitation centre at Qui Nhon at a cost of 1.2 million to care for 50 in-patients and 100 out-patients.

In the Commonwealth Caribbean, much of our capital assistance is going for the improvement of airport facilities in the Eastern Caribbean region, essential to the development of the tourist industry in that area.

Over four million dollars has been allocated for this purpose.

Still in the Caribbean area, CIDA has allocated \$950,000 for the construction of prefabricated schools in Jamaica, \$400,000 for the development of a dairy industry in Trinidad, and \$400,000 to the University of Guyana.

We are also helping to provide low-cost housing projects, rural electrification, aerial surveys, facilities for the improvement of harbours, and the undertaking several feasibility studies.

In Commonwealth Africa, CIDA, with the help of the Department of Education in Alberta, is contributing to the design, construction, equipping, and staffing of the Benin City Technical High School in Nigeria.

Canadian teachers and advisers will be provided over a five-year period, while Nigerians will be trained in Canada to take over from them eventually.

Canada is to contribute \$1.5 million to the construction of the school, while Nigeria will contribute \$800,000.

Additional equipment was provided last year to the Accra Training School in Ghana. Since 1962, Canada has provided \$1,305,000 to this technical institute, which was built and staffed by Canadians.

The aerial photography and mapping project continued last year in the coastal region of Tanzania. We have so far provided \$1,350,000 to this project. Last year a further \$1 million loan was approved for an aerial photography and mapping study, which will be used as the basis for planning the development of 30,000 square miles in South-West Tanzania.

In Francophone Africa, Canada has assisted the University of Butare, in Rwanda, since 1963. In January 1967, a 5-year financial plan of support was established whereby Canada is contributing \$750,000 annually to the University of which approximately 60 per cent covers the cost of Canadian professors and administrators and 40 per cent represents our contribution to the operating expenses of the University. In addition, scholarships are provided for the post-graduate training in Canada of Rwandese students who are being groomed to teach at the University.

In Tunisia, Canada is constructing a 42 mile, 90 Kilovolt transmission line from Tunis to Korba, a circuit terminal at Tunis, and a receiver sub-station at Korba. These facilities are required in order to satisfy the growing

demand for power in the Cap Bon area, originating largely from the agricultural sector and the fast-expanding tourist industry.

In Ivory Coast, we are undertaking a pilot rural electrification project, whereby the existing electrical system will be extended to supply power to some 50 villages in an area 30 miles north-west of Abidjan. This is the first attempt at rural electrification in Ivory Coast and it will launch a long-range programme to supply power to all of the country's rural areas.

In Morocco, Canada will finance a cadastral survey of 2,700 sq. miles of farmland in 5 selected regions. This survey will produce an inventory of land and basic information on land tenure, agricultural soil types, types of cultivation and forestation, and types of housing, roads and public utilities required. The Government of Morocco needs this data to develop and modernize the agricultural sector of the economy.

In Cameroun, work is underway on an airborne magnetic survey of 6 areas representing 35 per cent of the total area of the country and a photogeological study of the entire country. This is required to identify the most promising areas for conducting mineral exploration.

Our aid program to Francophone Africa entered a phase of rapid expansion with the Chevrier Mission, established by the Secretary of State for External Affairs in January, 1968. In conducting an on-the-spot examination of the Canadian aid program there, the mission had authority to commit up to \$40 million of Canadian Government funds to assist projects submitted by the host governments.

All of that amount was committed to 49 projects to be implemented over the next 5 years, 39 of them capital assistance projects in the areas of education, agriculture, public health, the development of natural resources, tourism, and fisheries. 29 projects will be financed on a grant basis, the other 20 through soft loans.

One of the most interesting requests presented recently to CIDA for financing has been the Ghana-Togo-Dahomey Transmission Project. The governments of these countries requested Canadian financing for the construction of a transmission line from Ghana through Togo and Dahomey to provide hydroelectric power to the coastal regions of the two French-speaking countries.

Canada's involvement includes the design and construction of the transmission line and the cost of four additional generators. The total estimated cost of the project is \$13,826,000 of which \$446,660 will be in grants and the rest in loans.

In Latin America, our program began in 1967. Since then, Canada has allocated \$50 million in development loans through the Inter-American Development Bank.

Among the loans signed under this program are: first, one for \$16,740,000 to Colombia to help finance the upper Anchicaya River electric power plant. The largest power plant in Colombia's history.

Second, \$9,320,000 to Brazil to expand electric power generation transmission and distribution facilities in 10 Brazilian states.

Third, \$1,260,000 for a comprehensive study of the Guayas River basin in Ecuador.

Fourth, \$3,240,000 for construction of a new port at Acajutla, in El Salvador, Central America.

As part of the review of Canada's foreign policy now underway, the Government has said that it is considering ways of extending the scale and broadening the scope of our development aid to Latin America. In many

• 1145

of the kinds of projects that I have been referring to, Capital Assistance is combined with Technical Assistance to assure that local personnel receive the training necessary to enable them to make use of the facilities provided.

Approximately one sixth of Canada's total aid program is channelled through multilateral organizations, grouped in three principal categories:

The United Nations, The World Bank Group, and The Regional Development Banks. Last year, Canada's total contribution to these organizations amounted to \$61 million.

Among the UN agencies, the UN Development Program receives the largest continuing share of Canadian Development Funds. Last year we increased our annual contribution to the UNDP to \$10,750,000.

Canada also supported the programs of UNRRA, the Office of the United Nations High Commissioner for Refugees, the World Food Program of the Food and Agricultural

Organization, the United Nations Childrens Fund, and The International Atomic Energy Agency.

The total amount of Canadian contributions provided through these and other international organizations amounted in the 1968-69 fiscal year to \$25,760,000.

The World Bank Group includes the bank itself, the full name of which is the International Bank for Reconstruction and Development. Then it also includes the International Development Association and the International Finance Corporation.

Canada's total contributions to these organizations collectively amounted to \$27 million last year.

An important event in the history of the World Bank Group was the agreement reached to replenish the soft loan fund of the International Development Association to the extent of \$1.2 billion over a 3 year period.

Canada played a leading part in this important exercise and was one of the first nations to provide its share of the replenishment.

Canada also belongs to consortia established by the World Bank, the OECD, or the Inter American Development Bank, to coordinate assistance to India, Pakistan, Turkey, and Greece, and to consultative groups for Ecuador, Korea, Malaysia, Nigeria, Peru, Thailand, and Tunisia.

We are also actively involved in supporting the establishment and operation of regional development banks through which resources of the region concerned, and those made available by donors outside the region, are mobilized and channelled by collective action to meet the development requirements of the region.

Last year we provided \$8.2 million through the Asian Development Bank and together with the United Kingdom, joined with the countries and territories of the Caribbean area to work out plans for establishment of a development bank to serve that region.

We have also provided a limited amount of technical assistance to the African Development Bank and are considering additional assistance to this important new institution.

Another program of a multilateral character is the Commonwealth Technical Assistance Program administered by the Commonwealth Secretariat.

This relatively new program will help the developing countries of the Commonwealth in the fields of development planning, project preparation, statistics, finance, public administration, and trade promotion.

Each of the Commonwealth donor countries including Canada will provide finances through the Program for the transfer of technical skills between Commonwealth developing countries as well as from the more developed countries to the developing countries.

In Francophone Africa, CIDA has agreed to contribute \$500,000 over the next 5 years, to the International Association of French-language Universities in support of university projects in French-speaking Africa and the Far East.

• 1150

Also, at the Niamey Conference held in Niger last February, Canada agreed to support an agency to be formed for the provision of Technical Assistance to Francophone Africa and the Far Eastern French-speaking territories.

In April 1968, CIDA initiated an important new program designed to assist Canadian Non-Governmental Organizations to increase the scale and the scope of their participation in international development. These agencies are already making an important contribution.

It is estimated that in total, they provide some \$35 million annually for overseas programs of a development nature. Indeed, they have done much of the pioneering on which Government aid programs are based.

Increased private programs are vitally important as a complement and a supplement to the official aid program, particularly in areas where their private character enables them to operate more effectively than government.

During the fiscal year 1968-69, \$5 million were allocated to support specific projects and programs of Canadian private agencies, and the estimate for 1969-70 includes provision for \$6.5 million for this purpose.

Our assistance is extended to the voluntary agencies in the form of grants or contracts under conditions designed to stimulate higher levels of private financing and new program initiatives.

The largest single grant went to the Canadian University Service Overseas, which

we know as CUSO, which received \$2,374,360. This enabled about one thousand Canadians to work in 42 developing countries under CUSO auspices. CUSO is a unique Canadian organization which is making a highly significant contribution to Canada's total development effort. It is also an outstanding example of co-operation between the private sector and government.

One of CUSO's notable contributions was its initiative in helping to establish a companion organization—Canadian Executive Service Overseas or CESO, as we call it for short.

This new organization recruits experienced Canadian business and professional people, many of them retired, for specialized short-term assignments in which their skills and experience are made available to the less-developed nations. Last year, CESO received a CIDA grant of \$311,000.

Other CIDA grants to non-governmental organizations during the past fiscal year included \$64,642 to the Canadian Teachers' Federation to provide an in-service teacher program to certain developing countries; \$75,000 to The Dominican Sisters for the construction of a nursing school in Rwanda; \$26,970 went to the Canadian Red Cross Society to help finance school gardens, well digging, orchard planting, and poultry raising by village children in Sudan; \$100,000 was granted to The United Church Missions of Canada for manufacturing small portable drill rigs and for training Indian well diggers and \$100,000 went to The Canadian Hunger Foundation to help finance a training centre offering instruction in food technology and in the preservation and processing of indigenous foods.

Each year Canada also allocates certain funds for international emergency relief and these funds are administered by CIDA.

The amount of funds allocated under this program depends, of course, on the number and extent of the emergencies which arise during the year and to which we must respond.

By definition, emergencies cannot be foreseen and it is not possible to determine accurately in advance what funds will be required.

Last year a total of \$200,000 dollars was provided under this program.

The most extensive emergency situation in the past year was undoubtedly that which arose in Nigeria as a result of the civil war in

that country. Canada has so far contributed \$2.6 million in relief to that area.

However, this amount was not taken from our limited International Emergency Relief Fund but was drawn from our normal bilateral aid allocations.

● 1155

International emergency relief funds for the past fiscal year were spent on a total of eight separate emergencies, including the following: \$121,000 for relief in Nigeria and Viet Nam; \$1,158 to cover the residual costs of an aircraft made available to UNRA for relief of refugees at the time of the Israeli-Arab war; \$7,500 to the Iraqi flood relief fund; \$10,000 to Burma for cyclone relief; \$30,000 divided equally between India and Pakistan for flood relief; \$2,500 in cash for the relief of Costa Rican earthquake victims; \$25,000 for the relief of Iranian earthquake victims.

The program we have described in summary form represents Canada's response to the economic and social needs of less developed countries.

Requests for assistance under this program are normally received from those countries through Canada's missions abroad. Then begins the process of selection of projects requested and the planning and execution of those which are approved. These are the responsibilities of CIDA's administration.

In the 1968-69 fiscal year CIDA's administrative costs amounted to approximately \$4,003,000 which represents about 1.7 per cent of total costs of our program.

It does not include the administrative costs of operating our diplomatic missions in the developing countries; one of whose main tasks is to administer the aid program in the field on behalf of CIDA. Nevertheless, by any standard, our administrative costs are lower than those of most aid agencies.

But operating a really effective development aid program is no easy task. I know of no other field of activity which is as complex and demanding in its administrative requirement.

CIDA's basic function is to bring Canadian resources to bear on the needs of the less developed countries.

Within Canada, this means that we must have direct relationships with the sources of resources; The universities, the school system, business and industry, the co-operatives,

the labour movement, professional organizations, hospitals; indeed, the entire range of the institutions of Canadian society, as well as thousands of individuals.

In the developing countries, we must work directly with the governments of these countries and the organizations directly involved in each individual project.

We must operate under conditions vastly different from those in Canada, involving a wide variety of different languages, cultures, traditions, attitudes, and sensitivities.

All of these activities must be co-ordinated with the programs of other donors by a process of continuous consultation with them directly and through the international mechanism that have been set up for this purpose.

● 1200

During the past two years, we have been reconstructing our organization to enable it to deal more effectively in this context with the program which is continuing to grow both in size and in quality.

The divisions responsible for sending Canadian advisors and teachers overseas and for bringing overseas students to Canada, were drawn together with the division responsible for the Capital Assistance Program in the new operations branch.

A new Planning and Economics Branch was set up, incorporating a division responsible for planning our programs, another with responsibilities for multi-lateral programs, one with responsibility for the private agencies program, and a liaison and evaluation group containing senior experts in various of the principal sectors in which our program operates.

Many of the support services within the agency were also refined and strengthened. For example, computer and data processing services were introduced to improve our personnel inventory and to collate field project information.

A management services group was added to the administrative and financial unit.

A separate personnel division was established and our information services expanded.

The new organization has enabled us to establish a more comprehensive system of planning and evaluating our program.

This begins with a thorough analysis of the development programs of each of the princi-

pal countries in which our aid is concentrated to identify the particular sectors in which Canadian aid can make the best contribution to the country's development.

A strategy is then worked out in agreement with the cooperating government for the Canadian aid program in the country for the next five-year period.

Requests for assistance from Canada for individual projects are then made by the country within this framework. Each year we send a high level team out to the country to review the results of the previous year's program and plans for the ensuing year.

These procedures have now been adopted in respect of a number of our countries of concentration and are being extended to cover the remainder of these countries.

In addition to the general country reviews, there is a need for intensive evaluation of specific sectors and projects. To meet this need, we send out special task forces consisting of our own personnel together with outside experts with the specialized knowledge and experience required.

Last year, task forces were sent, among other places, to India to do an agricultural study, to East Africa to study technical needs, to Vietnam for a study of medical projects, and to Francophone Africa for a review of our overall development program in that area.

One of the most important of our new review and evaluation procedures is the application of cost benefit analysis to the process of project appraisal and selection. Of course, cost benefit analysis has its limitations. It is not a substitute for the exercise of human judgment in evaluating all of the complex factors which bear on the value of a particular project. But it does provide a tool which is extremely useful as an aid in making these judgments by permitting common standards of evaluation to be applied to the economics of a wide variety of projects under consideration.

CIDA officers are now being assigned to our diplomatic missions in countries in which we have a significant aid program to assist with the administration of that program in the field.

In addition, certain contract personnel are being sent out to provide specialized and supplementary services required for the implementation of projects and programs at the field level.

Our headquarters staff has also been strengthened by the addition of a number of people with specialized skills who come to us under contracts for periods ranging from a few months to two years. This enables us to benefit from the experience of many skilled people from outside government who could not be attracted to the public service on a full-time career basis.

Many aspects of our program are now under intensive study. For example, the Association of Universities and Colleges of Canada is just completing a study of the role of Canadian universities in international development. The University of Ottawa carried out a study of procedures for briefing Canadian teaching personnel and experts being sent to the developing countries. Special studies are being made in the field of private investment in the developing nations.

A major series of studies has been undertaken as to the application of science and technology to the fundamental problems of economic and social underdevelopment in the less developed regions of the world. You will recall that the government has indicated that it intends to seek approval of Parliament for the establishment in Canada of an International Development Centre to help meet this most strategic need.

Of special significance, of course, is the major study now being carried out of Canada's basic policies in the field of international development. This is an important part of the government's overall review of its foreign policy.

● 1205

In summary, our development assistance program is in a period of significant change. We are endeavouring to translate the experience of the past into an organization and a program that will meet the demands of the future. We know that the development process is complex and often frustrating. We also know that it is an imperative process and a continuing one—that it will make increasing demands on our resources, on our ingenuity and perhaps most of all on our political will.

Important decisions must soon be made concerning the future direction of Canada's international development assistance program. Those of us to whom you have entrusted the administration of this program are dedicated to carrying out these decisions in a manner which will assure that Canada's con-

tribution to the less developed world will be in keeping with our highest traditions and expectations.

The Chairman: Ladies and gentlemen, I know you would want me, on your behalf, to thank Mr. Strong and CIDA for this film presentation. I believe it is the first time a film presentation of this type has been given in connection with the review of Estimates and I know that all of us have found it most interesting and impressive.

Mr. Strong has very kindly said that he would be prepared to answer any questions which anyone may have with regard to the film presentation.

The members of our House of Commons Committee will have the opportunity later to ask specific questions with regard to the items in the Estimates. So, if there is a large number of questions perhaps it would be fair to give those who are not members of our House of Commons Committee a little bit of priority. However, we will see how things go along. Mr. Lewis?

Mr. Lewis: Before you start questions, Mr. Chairman, I was wondering whether the audio part of the presentation is available in some transcript form. Mr. Strong and his associates threw a lot of figures at us and you darkened the room so that we could not write; all of which was undoubtedly a deliberate plot. Can we break through that plot and not to have to wait for the minutes and have a transcript of what was said?

An hon. Member: Was it recorded also, Mr. Chairman?

Mr. Lewis: I presumed it was recorded for the minutes.

The Chairman: It was recorded, but you wish to have a transcript available before the minutes. Is that the problem, Mr. Lewis?

Mr. Lewis: In fact, personally I would have liked an opportunity to study it before questioning begins, but I suppose that would be impossible.

Mr. Strong: Mr. Chairman, we do have the transcript. We had not come prepared to provide the number of copies that would be required, but I am sure that by this afternoon we can have these available. We have a number of them here for our own use and we can certainly provide them to this Committee.

The Chairman: Could I get some idea of how many copies Mr. Strong would need for that purpose? How many of you would like to have copies?

Mr. Thompson (Red Deer): Each member of the Committee should have a copy, Mr. Chairman.

The Chairman: That would be 30, but are there others as well? I would think that 40 should cover it, Mr. Strong. Mr. Allmand did you have a question?

Mr. Allmand: I had the same question.

• 1210

The Chairman: Then we are open for general questions from anyone with regard to the film presentation or of CIDA generally. Mr. Anderson?

Mr. Anderson: This is in the same general area, Mr. Chairman. Somewhere in the presentation it was mentioned that 15 of these 77-odd nations are at what you might call a take-off point. They are in a position whereby, in the foreseeable future, they can be developed to the point where they become developed rather than developing nations. Then later on in the presentation we heard of 10 nations of concentration and I wonder how these correspond. I wonder if you could tell us which nations were emphasizing this point and whether or not these are the nations we can expect in perhaps 4 years, 10 years, or 20 years, to stop receiving aid and, perhaps, contribute it.

Mr. Strong: Mr. Chairman, the first figure mentioned was in the more general part of the presentation and referred to the World Bank's estimate that within the next 10 to 15 years about 15 countries should be in a position to free themselves entirely from the necessity of receiving foreign aid. This is, of course, relative to the total world picture and not just to those countries Canada is supporting. I cannot remember all of the countries but some of them are Taiwan, Iran, Jordan, Korea, Singapore, countries of this calibre.

The 10 countries or areas in which Canada concentrates its aid do not necessarily bear any relationship to these. In Asia they include: India, Pakistan, Ceylon and Malaysia and none of these countries are on the list that I earlier referred to. Malaysia might be; I am not sure whether Malaysia is on the World Bank list of 15 that might make it. It would be quite close to being in that category

if it were not in that category. They include Ghana and Nigeria in Commonwealth Africa; Tunisia, Senegal and Cameroon in Francophone Africa and then the Commonwealth Caribbean which we, for these purposes, consider to be one area.

Mr. Anderson: Is it an area which you think would be possible of fairly rapid development? Is it one of the 15?

Mr. Strong: No, it is not. Jamaica and Trinidad would be included, I am sure, in that 15. Trinidad is almost at the point now where the amount of external assistance it requires is relatively limited. We look at the Caribbean in terms of our program as an area of concentration. There is quite a lot of variety within the area as to the stage of development that these countries are at. For example, the island territory of Dominica is at a very low stage of development and Trinidad, as I have mentioned, is at a fairly advanced stage.

Mr. Anderson: Could I conclude then that there is no real effort on your part to direct aid to countries which, perhaps in the relatively near future, could reach a developed level, a level at which they no longer need aid?

Mr. Strong: This is really one of the fundamental policy issues confronting those who make aid and development policy. Should we concentrate our efforts on those who are relatively better off, who are likely to be in a position to become self-supporting very shortly, or, do we concentrate our efforts on those who are really at the bottom of the ladder, who are experiencing that dire form of poverty that requires them to live at less than human levels? This is an important policy decision. Looking at the distribution of our program, I do not think the decisions have been made based solely on that point; in fact, a good deal of our aid is directed to countries that have a fairly low level of development as measured by their average per capita GNP. India, Pakistan and Ceylon together represent the largest portion of the so-called less-developed world and those that have the lowest average per capita income.

Mr. Anderson: Would you say this basic policy question has more or less been decided, generally speaking, in favour of the lower level of developing countries rather than those who are capable of rapid expansion in the near future?

• 1215

Mr. Strong: That is not the entire answer. I think you cannot really rationalize the distribution of Canadian aid based on application of any one factor. I think there is a historical process through which Canada got into the aid business. The first countries that became independent in Asia, which were the object originally of forming the Colombo Plan, were India, Pakistan and Ceylon, and Canada's coming into the aid business dates back to 1950 when the Colombo Plan was formed primarily for the purpose of assisting those nations. They also happen to be amongst the poorest nations but I do not think you can say that we are directing our aid to them because they are poor. They also happen to fall into that category.

In Francophone Africa, for example, where we are really increasing our program at a very rapid rate, and in the Caribbean area taken as a whole, the standard is relatively high. Some of the countries of Francophone Africa are receiving very substantial amounts of aid from other sources that are at fairly advanced stages of development in terms of per capita GNP. The same is true of many of the Caribbean countries. So we do have a number of countries in which we are concentrating and where there is also a relatively high level of development as represented by average GNP.

Mr. Anderson: I have one final question.

The Chairman: Yes. May I ask first, though, can those at the back of the room here the questions which are being asked here at the table? Can you hear the answers? Mr. Anderson.

Mr. Anderson: I am sorry to take up so much time, Mr. Chairman; it is a very interesting subject. I have one final question. It appears to me, sir—or at least to the press—I have read, that your Department, your office, is concentrating its aid efforts and this, I think, is a very good thing, although from the previous questions I have asked, I think, perhaps, we have a difference as to what criteria should be used for concentration. However, it appears from your presentation that we have expanded enormously in other parts of the world such as Latin America, for example, where we did not give aid before. I wonder why this is taking place sort of contemporaneously with a concentration on 10 countries you are nevertheless still expanding the total number of countries that

are receiving aid. What is the rationale behind that?

Mr. Strong: We administer the program. Government policy determines the selection of the countries. I would point out that Latin America has been receiving aid at the rate of \$10 million as development loans per year for the last five years. In other words, it has not just started to receive aid in the last year or two; it has been receiving aid for five years. Ten million dollars out of roughly a \$300 million aid program is a relatively small percentage of the whole. The government has said that it is part of the Latin American policy review. Mr. Sharp has indicated that the Canadian government is considering increasing assistance to Latin America but no specific decisions in that respect have yet been made.

The Chairman: Do any of our colleagues from the Senate have any questions to ask Mr. Strong? In the meantime, while you are thinking of them, I will call Mr. Laniel.

Mr. Laniel: Thank you, Mr. Chairman. Mr. Strong, I first wish to congratulate you for this presentation. I am wondering if it is planned by CIDA to do some public presentation of this. Actually, as politicians, we do have to convince our electors that external aid should be expanded and this is a means by which our job would be much easier because there is also a need in the country. Is there a program planned that such a presentation could be made available to institutions, at least schools or universities?

Mr. Strong: Mr. Chairman, we have expanded, and are expanding, our general program of information. The particular presentation you have seen will be useful to us when we extract from it those portions that relate specifically to the votes, and matters that this Committee has been equally concerned with. This presentation itself will

• 1220

assist us in our job of informing the Canadian public about our aid program.

We also have a series of other things. We are helping to conduct seminars across the country in response to requests that are made to us from communities. A number of communities across the country, either through their community organizations or, in some cases, through their universities, have asked us to undertake to help them provide public seminars which would increase the knowledge

in those communities of the development process. A lot of this, incidentally, has come as a result of the interest generated by such things as Marches for Millions. So we are responding to that and we are increasing our total information effort.

Mr. Laniel: At the end of your presentation you spoke of the project of an international development centre. Could you expand on that? Will this be a research centre or will this be a place where students from underdeveloped countries would be welcome and will it be a private or a governmental institution?

Mr. Strong: Mr. Chairman, the centre that I spoke of was the centre referred to by the government in the Speech from the Throne where it indicated that it did intend to bring legislation before Parliament to set up an international development centre. The purpose of this would be to focus the application of science and technology to special problems of development. It would, I presume, be a governmental centre in that it would be sponsored and financed out of Canadian government aid funds, but inasmuch as the government has not yet brought the matter before Parliament—it has not outlined in detail what its proposal in respect to the centre would be—I do not believe that it would be appropriate for me to...

Mr. Laniel: Has the Agency been asked to look into the matter?

Mr. Strong: Indeed, Mr. Chairman, we have been the agency responsible for doing all of the basic work which formed the basis for the decision of the government in this area. A very great deal of work has been done during the last two years on this subject.

Mr. Laniel: I do not know if it was said that CIDA was planning to reduce the Canadian content of aid or if it is already down to 66-2/3 per cent. What is the reason for this and what is the reaction of the actual countries involved? I imagine they would appreciate more help. In such a case would this mean that the other 33-1/3 per cent comes from the country concerned?

Mr. Strong: No, Mr. Chairman, the Canadian content applies to the portion of any piece of equipment or any materials provided under our aid program that is originally made in Canada and does not constitute imported materials. Even though the article itself in

total may be manufactured in Canada, we require that 66-2/3 of it actually be originated in Canada. The 80 per cent figure limited very severely the number of Canadian industries that could participate in our program because in order to manufacture equipment materials competitively, it is very often necessary to include imported materials to get the total cost of the product down. So, in fact, I think I could say that the reduction from 80 per cent to 66-2/3 per cent in content has been welcomed both by the developing countries and by Canadian industry. It has given us a far greater degree of flexibility and has made it possible for us to provide under our aid program a much wider range of Canadian products than was previously possible.

Mr. Laniel: Oh, I did not know that. I have one last question, Mr. Chairman. Concerning your food aid, how is this distributed in underdeveloped countries? Is it done through a governmental agency or is it through welfare...

Mr. Strong: Principally, the food goes to the government of the country concerned and is distributed by the agencies set up by that government for this purpose. Some of it is distributed through such international bodies as the World Food Program. Other parts of it—this is relatively a smaller amount in total—which is being provided in response to emergency relief, are very often provided through such organizations as, principally, the International Red Cross.

Within the countries themselves, a number of private agencies very often are designated by the government. For example, in India and Pakistan during the time of the Bihar famine when I visited those areas I found that Canadian milk powder actually was being handed out through feeding stations operated by CARE and UNICEF. They were doing this as the agents of the Indian Government. So the governments concerned very

• 1225

often do utilize a great many of the private agencies to help them with their distribution, but as far as we are concerned, our gift is to the government of the country concerned and it is that government which takes the basic responsibility for its distribution.

Mr. Laniel: I asked this question because sometimes we hear complaints—I do not mean official complaints—that some of the food does not go to the people who need it

the most and things like that. I imagine this is very difficult to control, from this end anyway.

Mr. Strong: We, of course, are very concerned with any complaints of that kind. We do hear these complaints periodically and I am sure periodically there is a basis for this. As far as our Canadian program is concerned, I am satisfied that we have set up as rigorous a control over this as it is feasible, but even with the most rigorous control you do get incidents that are reported to us from time to time. For example, the problem of the burst bags that was referred to a year or so ago where the packing was inadequate. There are individual incidents, but I am satisfied that there is no widespread abuse of food provided under the Canadian aid program.

Mr. Laniel: Thank you.

Mr. Guay (St. Boniface): May I ask a supplementary?

The Chairman: Mr. Guay on a supplementary.

Mr. Guay (St. Boniface): Do the governments to whom you have made a contribution indicate to you the manner in which they have allocated and spent the money?

Mr. Strong: In respect of everything except food aid we provide the funds only to support specific projects or specific programs that have been worked out and agreed to in advance between us and the country concerned and which are the subject of a specific agreement between us in which we required that they perform their part of the agreement just as we are required, of course, to perform our part. Generally speaking, they provide the local cost—the local support, the costs of local labour and local materials—and we provide the foreign exchange component of a project. This really involves us in a co-operative relationship and one in which we provide them with goods and services, not really cash money, and those goods and services are provided on a progressive basis as the project develops.

In the case of food or commodity aid, of course, these foods and commodities are delivered to the governments, but we have to be satisfied generally with the purposes for which they are intended and having satisfied ourselves in that way, it really is not feasible to trace each bag of wheat or each piece of copper down into its end use. Really all we have to do is satisfy ourselves, generally, that

they have a need for this, that their system of distributing and allocating it is adequate and then rely on that system.

The Chairman: Gentlemen, perhaps this would be an appropriate time to call the votes on the estimates and then we can continue with our general enquiries. I will call Vote 30 and, also, if you agree, Vote 35. Votes 30 and 35 are on pages 101 and 102 of the Blue Book. I will also call Vote L35 which is one page 462 of the Blue Book. These are also dealt with in the new form of estimates which you may have. Is that agreeable? Mr. Thompson?

Votes 30, 35 and L35 agreed to.

Mr. Thompson (Red Deer): Mr. Chairman and Mr. Strong, we all are conscious of the agreed objective that it is desirable for us to aim at 1 per cent of our gross national product for international development, but I am concerned that our percentage in relation to our gross national product is going down. According to the statistics you showed to us today in this very tremendous presentation, the percentage of our national income is only .5 per cent which means that the percentage of our gross national product is down to approximately .4 per cent. This is a decrease from the ratio of expenditure of these two figures from previous years. Would you comment on that?

• 1230

Mr. Strong: Mr. Chairman, we have been conscious of the fact that in the past year the increase in our expenditures has not paralleled the increase in our allocations. This was a rather deliberate move on our part. We have been in the process of making very major changes in our organization, in our administration and in our procedures for evaluating and implementing projects. When you are doing this it is necessary to slow down the process to some extent. You cannot change it really without slowing it down to some extent. We felt if we were gearing up to be able to handle effectively a much higher level of expenditures we had to be prepared to slow up the process somewhat and this is really what has happened. The impact of this has primarily fallen in the 1st year. We feel as a result of this we have today much better procedures for evaluating projects and that from here on in we have a much increased ability to respond intelligently to the needs of these developing countries.

I think this is going to lead to a much greater capacity on the part of our organization to spend effectively the larger sums of money that are being allocated to us. I would have been concerned to have to spend, and to feel that we were spending effectively with the same procedure that had been built up since the program began in the early fifties, the very much higher amounts of money that are envisaged for the future. I just do not think that the former kind of organization would have been able to do this effectively and I really feel that we have run a justifiable risk, if it is a risk, in slowing down our rate of expenditures in the last year or so.

Mr. Thompson (Red Deer): What you are saying then is that you are not extending the allocations that are available to you, or you have not in this last year?

Mr. Strong: We have not in the past year, but I am saying that I am confident we are going to be able to do this on a rising scale in the future and with a great deal more effectiveness than otherwise would have been possible.

Mr. Thompson (Red Deer): Could we have the percentage statistics provided to the Committee for the last ten years in relation to the actual expenditure on aid relating to GNP, and to gross national earnings? Would it be possible for us to have those statistics?

Mr. Strong: Yes, indeed, we have here a group of statistics presenting this information in various forms. I am not so sure it gives you precisely what you have asked for, but we can certainly get that. It does give the allocations and expenditures by various categories from the conception of the program up through the end of the 1969 fiscal year.

The Chairman: Do the members wish that to be attached as an appendix to our proceedings when it is prepared and filed with the clerk?

Some hon. Members: Agreed.

Mr. Thompson (Red Deer): You mentioned that one of the increasing difficulties with recipient countries was the repayment of interest and loans that have been made under capital development loans.

Mr. Nowlan: May I have a supplementary on the previous question if you are going to change the topic?

The Chairman: Would it be satisfactory Mr. Thompson, to permit a supplementary from Mr. Nowlan before we go on to your new question?

Mr. Thompson (Red Deer): All right.

Mr. Nowlan: I think this is related to Mr. Thompson's other question. Mr. Strong, you mentioned in your presentation there were 16 countries in this DAC which set 1 per cent as a commendable target. I wonder if, now or later when you give us the figures Mr. Thompson asked for, you could let us know also which countries have hit that target, or how they fared with that target of 1 per cent over some period of time.

Mr. Strong: I would be quite happy to provide the relevant figures from the DAC statistics indicating the performance of other countries as well. We are quite happy to file that record with the Committee.

Mr. Allmand: I have the figures. I might point out all those figures are in the CIDA Annual Report 1967-68. They have all the figures for all the DAC countries and also the total figures plus percentage of GNP up to 1967. They have it from 1962 on to 1967.

Mr. Thompson (Red Deer): I think it is important, though, that we get this last year because of the significant change.

Mr. Allmand: Right, I am just pointing out they are all there.

• 1235

Mr. Thompson (Red Deer): Relating to this problem of repayment of capital assistance in the form of both payments and interest, there is an increasing proportion of our expenditure, as you outlined, that is going into capital assistance projects. Am I correct in saying that?

Mr. Strong: That is true in one way, but it is inevitable in the large expenditures. Large expenditures are primarily related to capital projects, but our technical assistance and educational programs are receiving major emphasis in terms of the actual expansion of those programs. They are being expanded at a rate about as fast as is feasible to expand them. Finance is not the principal constraint on expansion of these programs; it is the availability of human resources.

The programs requiring large expenditures of funds are, in fact, capital programs, but we are no longer making quite the same dis-

inction between these two. We are more and more undertaking what we call integrated projects where we combine a capital project with the program of developing technical assistance related to that project. I think you saw in the presentation for example, the Niger dam, where we are providing training. The Niger dam is actually financed primarily from multilateral sources, but under our bilateral program we are providing systematic training for the staff that is going to be running that project. This is now built into almost every one of our capital projects; programs designed to train people to run the project, as well as the capital resources to construct the project, in the first place.

Mr. Thompson (Red Deer): Are you saying that the increase of capital assistance does not really represent the emphasis of CIDA as it relates to the total aid program?

Mr. Strong: Yes, I would say that you cannot look at the dollar comparison in terms of the program emphasis because inevitably there will be more dollars involved on the capital side than there will be on the educational and technical assistance side.

Mr. Thompson (Red Deer): I have just one last question, Mr. Chairman, in relation to capital assistance including soft loans. Do you really regard these as loans in the strict technical sense or is this merely a technique of getting aid out that is more satisfactory than it would be if it were given directly as a gift. Do you expect repayment in other words?

Mr. Strong: The basic philosophy behind development loans is really an assumption that development will be successful to the point that these countries inevitably will reach the stage where they will be capable of making repayment, but that is not likely to happen in the near future. In the meantime, we have to be concerned not to overburden them in the short term with repayments of principal and high interest charges.

Taking those separate factors into account, the Canadian development loans, I think, really serve both purposes rather well. First of all, they are for a period of 50 years, payment of ultimate principal is not required for 50 years, which certainly allows a rather long time for the development process to take effect. It does, however, call for ultimate repayment if the country presumably is in a position to pay at that point. In the meantime, because they are interest free and because there is a grace period of 10 years on

any form of repayment of principal at all. They have a maximum period during which the development loan does not impose a strain on their current development resources. It has to be admitted that if you take the actual present value of these loans at current interest rates, they have, what we would call in our development jargon, a very high grant component. In other words a development loan for 50 years at 0 per cent is very close in present value to a grant.

Mr. Thompson (Red Deer): Yet the problem, as indicated is that the very gifts are becoming a chain around the neck of some of the countries that drags their foreign exchange and makes it impossible for them to divert as they might in their own effort.

• 1240

Mr. Strong: Right, that primarily is a result of high interest payments and relatively short-term loans requiring substantial annual repayments of principal.

Mr. Allmand: Mr. Strong, what was the exact amount you said was given to Nigeria in emergency relief in 1968?

Mr. Strong: The figure shown on the chart, the principal amount, was \$2.6 million. In fact, that was the portion that was charged against our normal Nigerian allocation. There was another amount of approximately \$400,000 that appeared elsewhere as part of the Emergency Relief allocations, and I think one or two other places in the estimates. However, the total is \$3 million. The principal figure referred to in the presentation was \$2.6 million.

Mr. Allmand: Is this what was given in 1968 or up to the present time?

Mr. Strong: Up until March 31, 1969, the end of the 1969 fiscal year.

Mr. Allmand: Until March 31, 1969?

Mr. Strong: Yes, until the end of the fiscal year.

Mr. Allmand: Are we still responding to requests to give money to Nigeria to help them in their civil war? Is there anything budgeted for this fiscal year?

Mr. Strong: Well, as we mentioned in the presentation, it is extremely difficult to budget funds for emergencies. However, the extent of the Nigerian emergency is such that it relates to their entire development effort

and, therefore, we felt it appropriate to use funds that were designated for the normal Nigerian program to help out with the emergency. The budget for the normal program for Nigeria has not yet been agreed by the government, but it is very likely that it will be no less, and perhaps more, than the 1968-69 budget.

Based on the total allocations determined by Parliament, the Cabinet has to make a decision as to the allocation of these funds to individual countries, and while it has not yet made that decision on how it is going to allocate these funds amongst the various countries, our recommendation as an agency is that the Nigerian allocations be certainly no less than they were last year. That is a long way of saying that the chances are that there will be funds available at least equal to those provided last year.

Mr. Allmand: Does that figure that you mentioned include amounts of money that were given to the Red Cross and churches and found its way to Nigeria?

Mr. Strong: That includes only the government support for those activities. The \$3 million figure includes only actual government expenditures. Part of those expenditures were used to provide transportation costs, for example, for food and other materials that were provided by private agencies. Of course, the value of that food and the value of contributions in toto by private agencies is considerable. It is not included in these figures.

Mr. Allmand: In any case you would expect our emergency relief to Nigeria to continue this fiscal year?

Mr. Strong: Yes, indeed.

Mr. Allmand: How many persons were involved in the CESO program and do you have any plans for expanding that program?

Mr. Strong: The CESO program is a new program. Every new program takes time to get off the ground. The CESO program has made a good start when you compare it with its U.S. counterpart and its Japanese counterpart. It has actually put in the field more people at an earlier stage of development than each of those counterpart organizations. In fact, they had in the field at the end of the year some 28 people, as I recall, and since that time the number has built up considerably. There is a fair time lapse between the time a need is identified in a developing

• 1245

country and a man recruited from Canada and that man getting out into the field. I believe the figure was 28 at the end of the last fiscal year.

Mr. Allmand: I might say that I personally feel that this is a great source of manpower for overseas countries because we are having more and more early retirements resulting in a lot of men, whose talents I feel are being wasted, sitting around in Canada. I am sure that they would like to do this, so I am quite pleased that you are assisting this program.

Do you give any money to the assistance of the Coady International Institute at Antigonish?

Mr. Strong: We do not support the institute as such, but we support its programs. As a matter of fact, we have had a long and very happy relationship with the Coady Institute. We support many of the students who come from the developing countries to receive their training at the Coady Institute. I do not know the precise percentage but I think more than 50 per cent of the students in some of their programs are supported, in fact, through CIDA programs.

Mr. Allmand: In the same way that you support students at other Canadian universities?

Mr. Strong: Yes, indeed, but because of the specialized nature of the training provided at the Coady Institute, and the fact that it has had a relatively unique relationship with many of the developing countries, the percentage of the students financed under our program at that particular institute is probably higher than it is at most.

Mr. Allmand: In looking at the comparative DAC figures I notice that France has an exceptionally high percentage of its GNP dedicated to external aid and it out-paces all the others by quite an amount. Is this due to special aid programs to their former colonies or is France just giving that much more than all the other countries? When the DAC countries give aid it would have to be to underdeveloped or developing countries, would it not—not their language programs in developing countries?

Mr. Strong: No. The principal competition with the French are the Portuguese in terms of their performance under the DAC tables. I think Canada has always taken the position

that the DAC statistical tables, while useful in some degree, really do not provide an adequate measure of the total quality of a country's contribution to the aid process, and this is partly reflected by the fact that France and Portugal are at the top of the list.

The Portuguese program is relatively unique. It is related almost entirely to its overseas territories.

The French program is much more a conventional aid program in the sense that a good deal of what they spend is, in fact, spent on economic and social development, but it is very largely concentrated in those countries in French Africa and elsewhere which were formerly part of the French colonial empire, and a very large amount of the cost is related to the supporting of substantial numbers of French officials and French teaching personnel who previously served in those same countries under the colonial regime. That is not to say of course, that this does not represent a reasonable contribution to development, but it does mean that their program does benefit by inclusion of items which would not likely be included in a normal aid program.

Mr. Allmand: Do these figures include military assistance?

Mr. Strong: No, they do not.

Mr. Allmand: Thank you.

The Chairman: Gentlemen, we just have time for questions from Mr. Nowlan. We will be meeting again—in this same room at 3:30 p.m. and perhaps then we could pick up the questions from Mr. Howard and Mr. Cafik, Mr. Nowlan.

Mr. Nowlan: Yes, the hour is getting late, Mr. Chairman, and I have several questions, but first I would like to ask two and then in coming around the second time this afternoon get more details on something else that interests me.

Firstly, on a digression of Mr. Laniel's question about this Miles for Millions and the educational value of the type of thing we saw today for Members, something like that, or even less sophisticated and more graphic, for

• 1250

schools, including the Miles for Millions showing what a mile will do when they walk the mile, I feel, as the father of two daughters who walked more miles than I have ever walked, would be not only educational but productive in dollars in the future. Coming

down to the present, I would be interested, Mr. Strong, in the budget. As I understood the presentation, you said \$1 billion, as I remember it, has been contributed or paid out or allocated since 1950, and if that is correct, or whatever the total figure is in the program, I would like to know what part has been grants, loans or export credits, as a start?

Mr. Strong: Yes, the \$1 billion figure referred to was a figure for the total amount of contribution to the Columbo Plan area. The Columbo Plan has received the largest single amount of Canadian aid on a cumulative basis.

As to the division between loans and grants, my staff has copies of these and we had actually geared ourselves to provide them before the afternoon session when we thought we were going to get to the more detailed questions.

Mr. Nowlan: That is fine. I would like to pursue the outlay and the difference between the grants, the loans and/or export credits. Do you include an export credit as a loan or is it in a separate category?

Mr. Strong: The export credits are always a source of some confusion because they are not administered by our agency, we do not consider them aid, but we have to refer to them in reporting on total aid figures. That is why they figure in our presentation, otherwise there would be a gap between the figures that we are using and the figures quoted by DAC because under DAC's official figures long term assistance provided to developing countries, even if it is under export credit arrangements, if it exceeds five years in term, is counted as aid, and therefore, to be comparative with the performance of other nations, we have to include it. But it is not really a part of the Canadian Aid Program.

Mr. Nowlan: Mr. Chairman, if I could come back to that element this afternoon, either at first or when I get my turn next, I would like to pursue it.

I would like to ask a general question which perhaps relates to policy, and it struck me as we watched the pictures today, of the 77 countries, as I remember the figure, with less than \$500 per capita, how many of those countries have a birth control program or disseminate education in the schools or to the public on birth control? Is this an element in

policy as to how we contribute to an individual country? There are several questions there.

Firstly, I would like to know of the 77 countries—and it was pretty graphic, obviously, from some of the pictures you showed—with less than this \$500 per capita income, how many of them have any type of birth control program or centres or even allow information to be disseminated? Surely, there must be some study on this or some knowledge of this.

My second question is, as far as I am concerned, without getting too provocative, if a country is not going to help itself in some areas, is this an element in the contribution that Canada is going to make to that country? Or is this another area of policy that is under review? Is there any policy on it?

Mr. Allmand: Mr. Chairman, is this to be answered this afternoon?

The Chairman: Would this be more conveniently answered by you this afternoon, Mr. Strong?

Mr. Strong: It is going to open a rather wide area.

The Chairman: Would it be satisfactory, Mr. Nowlan, to hold that answer over until this afternoon when we have more time? Perhaps to...

Mr. Nowlan: That is fine. I could perhaps start in again then?

The Chairman: Yes, we will have you first on the list.

AFTERNOON SITTING

Tuesday, April 29, 1969.

• 1534

The Chairman: We are now in a position to proceed. In front of you there has been placed the annual report of CIDA and also a black binder containing a great deal of information with regard to the assistance programs of CIDA. Mr. Strong has told me that all the figures which were mentioned this morning in the visual presentation are in that black binder and a great deal of additional information as well.

I believe Mr. Nowlan has a question for Mr. Strong.

Mr. Nowlan: Yes, Mr. Chairman. Thank you. Just before noon I asked a couple of questions, one with regard to policy and two with regard to the budget, the amount of aid and the difference between grants, loans and, perhaps, export credit, all of which are represented in the total figure. I would like to mention, first, this question on policy and the choice of 77 countries, as mentioned in the presentation, of the total 115 that were again shown in the presentation this morning with a per capita income under \$500. Firstly, how many of those 77 countries have specific birth control program? Secondly, where there might not be a government birth control program is there the possibility or the availability of birth control information, and, thirdly, what the position of the Agency would be if there were a request for either information or actual birth control devices from a particular country?

Mr. Strong: Mr. Chairman, with your leave before replying to this specific question, I wonder if I may introduce to you and to the Committee those of my colleagues who are with me and who may be called upon to explain and answer some of the questions. Would that be all right?

The Chairman: That would be fine.

Mr. Strong: On my immediate right, Mr. Denis Hudon, Vice President, Planning and Economics; on his right Mr. George Kidd, Vice President, Operations; sitting behind me here, Mr. Ross McLellan, Deputy Director General for Administration and Finance; at the end Mr. James Miller, Director General, Operations; Mr. Lionel Bonnell, Director General, Administration and Finance; Mr. Noble Power who looks after our Commonwealth Africa programs; Mr. Fergus Chambers, Director of the Planning and Economics Division; Mr. Jean Guerin my Executive Assistant and Dr. Henri Gaudefroy, Director General for Evaluation and Liaison.

If I may, I will now direct my remarks to reply to the hon. member's question. In the first instance, I really could not reply accurately in terms of the 77 countries. I could not tell you exactly how many of the 77 countries that receive some form of Canadian assistance actually have family planning programs. I can tell you that of the 10 countries or area in which our program is concentrated, each one of these countries has an official program of family planning. You will recall I mentioned that we consider the Commonwealth Carib-

bean as a single entity. Within that entity the two principal countries, Jamaica and Trinidad and Tobago have official programs of family planning. Some of the smaller countries and territories also do, but I actually cannot give you a figure on which those do or do not. However, generally speaking, throughout the Caribbean area there is an official approach toward family planning.

Secondly—

Mr. Nowlan: Pardon me, Mr. Strong. Did I understand—someone was whispering in my ear about something else—you to say that in the 10 main countries there is some type of program?

Mr. Strong: Yes, in every one of the 10 countries or areas of concentration there is an official government family planning program. Your second question dealt with the extent to which we are influenced by—

Mr. Nowlan: You answered the first and second parts, I think, in your general answer. I asked about official or government programs and if there were not even a government program, if information and/or devices were available.

Mr. Strong: In each of these countries it is true that there is a program. There are varying degrees of commitment by the respective governments to the programs with varying degrees of effectiveness. This whole matter of effectiveness is a difficult one on which to make a judgment.

Mr. Nowlan: The last part of my question was what would be the reaction if there were a request from a country for either information or actual material help in regard to some type of birth control program. Have there been such requests and if so, what has been the reaction or what would be the reaction?

Mr. Strong: We have not had any official requests for assistance in the family planning area. However, this quite possibly may arise from the fact that it is very widely known in international communities that we are, at the moment, precluded from providing direct assistance in the area of family planning because of the interpretation applied to the existing Criminal Code legislation and its application within Canada. It has not been government policy to to outside of Canada what is not feasible to do in Canada. Howev-

• 1540

er, in our own planning of our programs it is obviously necessary to relate the total development assistance program to the economic effects of population increases and this kind of thing. Therefore, it is obvious that we are mindful of this and its importance in total economic terms in the allocation and implementation of aid, but we are not in a position to respond directly—

Mr. Nowlan: Officially.

Mr. Strong: —to request for specific assistance in this area.

Mr. Nowlan: I have one last question on this field in view of your last answer. Pardon me, I should say, in view of your last answer I have only one last question on this field. From your experience—I appreciate there has been a transition and you have been there, perhaps, a relatively short time—taking 1950 as the beginning, have you found in your period and/or the advice you are getting from your officials, more of an awareness in the emerging countries—in these under-developed countries—for this type of assistance, help or information?

Mr. Strong: Quite clearly, I think there is a general awareness amongst the professionals, if I may use that word to describe those people who are directly involved in aid and development programs, an awareness, in fact, that we just cannot ignore the whole field of population growth and family planning if you are to be seriously interested in the development field.

Mr. Nowlan: Could I ask a supplementary to my last question? Has the United Nations and some of its agencies actually officially moved beyond the position that we find ourselves in because of the interpretation of our Criminal Code?

Mr. Strong: Canada has taken the positive position in recent times in its attitude towards the involvement of the United Nations and its agencies in family planning areas. We have been willing to see them do this and, as a matter of fact, we have taken the attitude that the most effective instrumentalities for providing assistance in this field are, in fact, the multilateral ones.

Mr. Nowlan: Then a country interested in this could, perhaps, find help and assistance through a United Nations agency which at the

present time they could not find through the Corporation?

Mr. Strong: That is correct.

Mr. Nowlan: Turning now to another area, I would like to ask you about the amount of aid you mentioned earlier this morning. I was in error when I referred to a billion dollars. You told me that figure applied to the Colombo Plan. Is there a figure for external aid from the inception of the program which, I gather, started with the Colombo Plan?

Mr. Strong: Up until the end of the fiscal year 1969, the figure on the aid program as such, excluding export credits, would be \$1.8 billion or more precisely, \$1,803 million. You will find that figure on Table 2 of the figures that have been provided to you. Now, if you wish to add export credits granted under the Export Credits Insurance Act, less the payments during the period, that would add another \$407.6 million and the total after allowing for repayments would be \$2,125.3 million.

Mr. Nowlan: I see, thank you. Leaving that general total figure and referring to the figure on page 24 of your report where it states that Canada's contribution in the last fiscal year was .6 of national income, does that figure comprise grants, loans and export credits?

Mr. Strong: Yes, it does.

Mr. Nowlan: We already heard this morning that there is no interest on the loans for the first 10 years. Is that correct?

Mr. Strong: There is no interest during the entire fifty-year period of our fifty-year loans. We do have a thirty-year loan, but we have not made many of those. Most of our loans are on a fifty-year basis, no interest throughout the entire period, no repayment during the first 10 years and thereafter—after the first 10 years—repayment commences.

Mr. Nowlan: Still staying, Mr. Strong, with that .6 figure of . . .

Mr. Lewis: I have a supplementary on that. Are there no loans on which interest is charged?

Mr. Strong: The only loans on which interest is charged are those made by the Export Credits Insurance Corporation. We do not consider them aid, although they are considered aid in the international account and they are not administered by our Agency.

Mr. Lewis: Are they included in your figures?

Mr. Strong: They are included in the gross figures.

Mr. Lewis: Yes.

Mr. Strong: The reason for this is that they are included in the figures reported by the Development Assistance Committee. It is, admittedly, confusing, but when we are talking about gross aid figures we do include these.

There was a period when we charged a service charge of three quarters of 1 per cent on our loans as distinct from interest. About two years ago that service charge was removed, so now our loans are granted completely free of either interest or service charges.

The Chairman: Mr. Ryan, do you have a supplementary?

Mr. Ryan: Yes, Mr. Chairman. The gross loans to export credits anticipated for the next fiscal year is \$318 million. If this is so, would this not throw out considerably this gross figure?

Mr. Strong: This is a non-controllable factor as far as we are concerned. Export credit loans are not allocated as are our funds on an annual basis. They come out of a total pool of funds and it is difficult to predict in advance the amount of these that are going to be loaned to individual countries in the developing world. The repayments are more predictable, but the actual loans are in response to specific projects that arise and from our point of view and the point of view of the Corpora-

• 1545

tion that administers them, they are rather difficult to predict. In fact, from the point of view of this Committee, I would think it would be more realistic to look at the figures that actually are controllable by our Agency or controllable through these estimates.

Mr. Nowlan: I appreciate that Mr. Strong, but, again, referring to your gross figure of .6—I have a theme that I want to follow through and I do not know whether or not you will agree with my premise or my theme—in that figure there are these loans and export credits, but also in that figure there are moneys payable to Canadians either by buying a million dollars worth of tractors in Canada for Nigeria and/or salaries to the

people in Nigeria or in any other part of the world whereby the government recoups some of this in tax, does it not? In other words, you have given us a gross figure and it happens to be .6, but really you can subtract from that figure loans which are going to be repaid. Even as you were giving your presentation this morning there may have been some members who thought we were paying too much—I do not believe that even though the taxpayer wants value for his money and in this area it takes a little time to see a return perhaps—but if .6 per cent is your figure for the last fiscal year, you actually can deduct from that figure loans, the amount of export credits and/or the income tax that is recouped by government. In other words, as a result of these deductions you get a figure that is less than .6 per cent.

Mr. Strong: We do not have any figures that would be broken down that way, although, I think, when we quoted the figures—I think I referred to earlier the actual loan repayments under export credits—we had not yet taken into account any loan repayments under our normal development loans because actually this is so small that it is not really applicable. I think that by any other standard our aid is real aid. It could be argued, I think, that the effective cost to Canada of the aid we provide is reduced to the extent that it is used to buy Canadian goods and services and to the extent that because of our policies, the recipient country is receiving those goods and services at a slightly higher cost than might prevail if they were purchased competitively on the international market.

Mr. Nowlan: But of the total figure, can you tell us today how much of that is a loan factor?

Mr. Strong: No, I cannot. I can tell you how much was loaned, there is no question about that. If you will look at Table 2, it breaks it down between grants and loans or in the case of multilateral programs, advances. We certainly can give you that breakdown and you will notice that for the entire period until the end of the fiscal year 1969 under our bilateral program, \$69.1 million was for grants and \$375.5 was in the form of loans. Under the multilateral program, \$214 million was in the form of grants and \$145.2 million in the form of loans or advances in the nature of loans.

Mr. Nowlan: To follow that through, again, with my reference point of the fiscal year 1967-68, is the .6 to which you referred based on \$90 million under loans in the bilateral program and the \$17 million under the advances in the multilateral program?

Mr. Strong: Taking what year?

• 1550

Mr. Nowlan: How can you correlate the two?

Mr. Strong: If you use this Table 2, you will see that using 1968—what year would you prefer to use?

Mr. Nowlan: I am using the fiscal year 1967-68 when it was .6 per cent.

Mr. Strong: Yes.

Mr. Nowlan: I am trying to figure out in that figure of .6 per cent how much of it is actually loans?

Mr. Strong: Well the total figure would be \$90 million under the bilateral program; \$17.7 million under multilateral to designated advances, plus \$63.6 million under export credits less \$19.7 million being repayments under export credits. Therefore, the net figure that you get down to at the end, on which the percentage is based, does take into account loan repayments under the Export Credits Insurance Corporation.

Mr. Nowlan: I do not want to belabour this, but it takes into account the loan repayments which is, in effect, \$20 million?

Mr. Strong: Yes.

Mr. Nowlan: But the other remaining figures total over \$100 million. In other words your .6 figure really is almost one-third. One-third would come off, would it not?

Mr. Strong: I do not quite understand.

Mr. Nowlan: There is \$90 million and \$17 million for over \$100 million, plus \$63 million. There is \$171 million minus your \$19 million odd for a difference of \$151 million, which is part of your program and is part of the total figure and represents a pretty sizeable portion of your total figure. All I am trying to get at is that it could be argued your .6 per cent could be reduced accordingly, because in theory you are going to get the loans back.

Mr. Strong: If you consider that loans do not represent real outlay of resources, then

that would be true, but I think, as far as developing countries are concerned, they are receiving real resources up to 100 per cent value per dollar. If you look at it in terms of the cost to Canada and the fact that the loans are interest free and for such long periods—I forget the present worth factor now—and apply a present worth factor to reduce the value of those loans to their present value, if they were the equivalent of grants, the grant equivalent is about 90 per cent. In other words, a dollar given out as a loan for zero per cent interest for 50 years is equivalent to 90 cents roughly, perhaps a bit more than 90 as a grant. Therefore, the grant component—if I may use that jargon—of our development loans is over 90 per cent.

The Chairman: Mr. Strong, would it be fair to say that with these figures you are proceeding on a cash basis rather than an accrual basis? In other words, these figures represent your cash outlays for aid less your repayments. You do not treat a loan which is eventually repayable as a deduction from the grant of a particular year?

Mr. Strong: Oh, no, it is an actual commitment.

• 1555

Mr. Hudon has just pointed out that on an expenditure basis for the year 1967—and it may be the figures I was talking about are the actual appropriations for the year—if you get it down to the expenditure level, \$213 million was actually spent in 1967 of which \$35.3 million was in the form of loans. That, of course, highlights the difference between the way the development assistance committee presents its figures and the way the appropriations appear here. The development assistance committee is dealing with actual disbursements of aid, some of which arise from previous years' appropriations, whereas what I referred to in table 2 referred to our actual approved appropriations.

Mr. Nowlan: I will leave the floor after this last question, but I have other areas I would like to examine. Just on this point—and you may have answered it in a general way, Mr. Strong, before—but of the moneys, whether it is loans or grant, either by policy, equation factor, or percentage factor, or just an administrative percentage factor, how much of that money is spent in Canada, or in effect is spent by Canadians?

Mr. Strong: The basic policy in respect of Canadian bilateral aid is that we provide not dollars, but Canadian goods and services. That is based on the requirement that our funds be used normally to supply goods and services which have a Canadian content of 66 2/3 per cent or higher. This is the figure that has recently been reduced from 80 per cent and which we referred to earlier.

Mr. Nowlan: Yes. How about the multilateral?

Mr. Strong: The multilateral contributions are normally given as outright contributions, either loans or grants, to the multilateral agency and are not tied to Canadian goods and services.

Mr. Nowlan: As far as this .6 is concerned in the fiscal year 1967-68, and from your other answers, would it be fair to say that that is the absolutely gross figure and that if anything, because of Canadian purchase content, and/or this loan question and/or the export credit arrangements, it most likely in all probability would be less than .6 per cent to the Canadian taxpayer? How would you put it?

Mr. Strong: I would put it this way. These amounts of resources were in fact transferred to the developing countries. So, as far as they were concerned, they received resources equivalent. The effective cost to the Canadian taxpayer would have been somewhat reduced by some of the factors that you referred to.

Mr. Nowlan: I reluctantly pass.

The Chairman: I will put your name down for the second round. I now have Mr. Howard, Mr. Cafik, Mr. Lewis, Mr. Legault and Mr. Thompson. Mr. Howard, you may proceed.

Mr. Howard (Okanagan Boundary): Mr. Chairman, I would like to say to Mr. Strong that I am very impressed by the work that CIDA does, but a number of years ago I read a book called "The Ugly American" and I wonder to what extent we might, as a nation, fall into the kind of situation in which the Americans have found themselves in various areas of the world?

Mr. Strong: I think that is a very real danger for all of us who are involved in aid and development programs. I do not think that there is any question that there is an adverse psychology set up in our relationships with

these countries by the very nature of the donor-recipient relationship. We prefer to refer to it as a co-operative relationship; it is in fact, and can only be a co-operative relationship. While we have our problems from time to time with individual Canadians in the field, by and large I think the kind of people we send out under our development programs are very aware of this and I think our record has been fairly good. In many instances the best ambassadors that Canada has are people who are sent out as experts under our program.

However, this is an ever present difficulty and it is a hazard inherent in aid programs and one that we try to overcome. Certainly, we have not learned all the answers to overcoming them, but we find that a good, well-intentioned capable Canadian can usually meet this problem head on and learn to win the confidence of the people he is working with and to tear down the barriers that exist.

• 1600

These barriers do exist at the very beginning: there are these preconceptions on both sides of the relationship. Therefore, you really have to start from a downhill position in a relationship of this kind. These things do work against you right from the beginning.

Mr. Howard (Okanagan Boundary): At what level do we pay our people who are representatives overseas with CIDA in relation to the salaries they would be getting in Canada?

Mr. Strong: The policy is to pay people at a rate equivalent to what they were getting in Canada with suitable allowances for overseas service, for lack of continuity, and for the actual cost to them of relocating overseas.

Mr. Howard (Okanagan Boundary): In effect, then, they would be quite wealthy people in many of these countries where they live.

Mr. Strong: Yes. By the local standards our people are obviously more highly paid because Canadians receive more normally for an equivalent kind of work in Canada than their counterparts would in developing countries. This unquestionably also poses a problem.

Mr. Howard (Okanagan Boundary): Do they live then at that standard of wealth in those countries, comparatively speaking?

Mr. Strong: It varies very much with the local circumstances. In some cases the allowances and the salary that an expert would get even though equated to Canadian conditions would permit them to live at a very high level by the standards of the country concerned. In other cases, and it depends very much on the country, people experience real hardship. I have seen some of our experts who are living under conditions that were rather enviable, and others who were at the other end of the spectrum. By and large though, they are encouraged, and their salaries permit them, to live at a middle-class standard in the countries concerned, which would equate to their level in Canadian society.

Mr. Howard (Okanagan Boundary): In poorer countries would this not create a real barrier between the Canadians and the people whom they are serving?

Mr. Strong: It depends very much on what they are doing. They are not usually living under conditions that are much different from those of their local counterparts in terms of housing and that kind of thing. Their total salaries would be greater, but the housing is normally provided by the local government and it would be normally provided at the standard they would provide for a person equivalent in their own government service. By and large, the housing standard would not be, but the standard of reimbursement, the standard of salaries that they would receive, is unquestionably higher.

It is a two-edged sword really because in the one instance by the cultural standards of many of these countries a person who consciously lives at a lower level than his station in that country would normally entitle him to very often erodes his capacity to make a contribution, it undermines respect for him and this kind of thing. This is not true everywhere but it is sometimes a factor. It does not always work the way we think it would. Very often we had people who have chosen to live at a very sacrificial standard, one that was really below the standards normally acceptable even in the developing country for a person on his level, and it has not always had the effect it was intended to have. It is very hard to generalize about developing countries. Their cultures and their standards vary very considerably.

Mr. Howard (Okanagan Boundary): I understand that CUSO workers work at local

salary levels; is that correct? They live at local living conditions; is that right?

Mr. Strong: CUSO people are volunteers basically although we do not really use that word, that word does not fully describe all

• 1605

CUSO activities anymore. However, they are volunteers at least in the sense that they work at a local salary. Very often the nature of their activities, too, is such that they are involved on very much of a grass roots level, say, as a teacher in a village, this kind of thing, where conditions are a good deal more difficult for living, but, where they nevertheless can live at a reasonable standard. Again, it varies a good deal. I have seen some CUSO people who were living by the standards of their local environment very well, and some who were living under very sacrificial conditions. It is true that CUSO people, because they are contributing their salaries, because in many instances, they are working at lower salaries than they would be able to get if they were doing an equivalent job in Canada, are living at a level closer to the level of the people around them.

Mr. Howard (Okanagan Boundary): Would you say that this would erode their position and make it more difficult for them to do their jobs than if they were paid at higher levels as CIDA people are? You suggested earlier that it is necessary to maintain a position for the CIDA people. You feel they work better and are more respected if they are paid at Canadian salaries.

Mr. Strong: There are two sides to this, too. I do not want to be waffling on this but it is very hard to generalize. If you are talking, for example, about a CIDA expert, an economist who is a senior adviser to the planning commission in Tanzania—I am talking of a rather specific situation—I think the chances are that although in total salary a man like that would be getting a good deal more than his Tanzanian counterpart his every day level of life would roughly correspond with that of his Tanzanian counterpart. If he were to choose to live at a very much lower level than those people with whom he was working in the Tanzanian government, as distinct from the general mass of the people in Tanzania, then I am not at all sure that his effectiveness would be increased.

On the other hand, if a man is out in a community development project in a village

and he goes back every day to the big hotel, if there is such a thing in the area, and lives at a very much higher standard than all of the people with whom he is associating, that obviously would have a rather negative effect. I think it is really a matter of what is appropriate in a given instance.

We have to apply policy on something of consistent basis. We cannot force people to adapt to a certain standard of living. We have to do it on the basis of what is fair in terms of payment for Canadians who are prepared to undertake these assignments, on the one hand, and what is an appropriate level for them to live, on the other. We cannot be rigid in our interpretation of how they should live, but we govern it; we do it through the allowance system. We pay them what they would be getting in Canada, and we provide allowances that are designed to enable them to live at roughly the level appropriate to the job they are doing in the developing country.

Mr. Ryan: On this point I have a supplementary, Mr. Chairman. Are there not many capitals in the world today that designate areas specifically as residential areas for political, military, trade and foreign aid missions?

Mr. Strong: There are, yes.

Mr. Ryan: You have to pretty well fit into that picture?

Mr. Strong: I think it is important to distinguish permanent personnel who are assigned to our diplomatic missions for the purpose of helping to administer our official aid programs. These are accorded the normal diplomatic privileges and are, in fact, a part of the diplomatic establishment in the country. These are a relatively small number of people.

The people I assume the honourable member was referring to, and to which my replies have been directed, are the people we send out as teachers, professors, or experts. They go out under contract; they are not public servants. We contract for their services for specific periods of time, and they fill specific

have to live at a level appropriate to the particular post they are occupying.

Mr. Howard (Okanagan Boundary): You mentioned teachers. If we pay teachers at Canadian salaries, you are talking perhaps \$12,000 a year or somewhere in that neighbourhood. What is the equivalent for a teacher in the West Indies? What are they getting, \$40 a month?

Mr. Strong: Mr. Kidd may wish to reply to that.

Mr. G. P. Kidd (Deputy Director General (Operations), Canadian International Development Agency): This again would vary, but it would be higher than that, I think more in the order of \$150 probably.

Mr. Howard (Okanagan Boundary): We will say \$150 as against about \$1,000 a month. Do you really feel this is not a serious barrier in our people trying to work at that level. I am concerned about it; I think it could be.

Mr. Strong: There is no question that these things are barriers and problems, but this whole process of international development is not an easy one. On the one hand you want to provide them with good people, and, to be fair to Canadians, we are quite happy to have as many Canadians as are prepared to come forward and volunteer their services at a very low price: we have volunteer programs designed to take advantage of that. But you cannot meet the needs of the developing countries for the kind of really skilled people that they require on a purely volunteer basis. What we are really trying to do is build up their own capabilities. The type of people that we are requiring more and more in our aid programs are people that are pretty highly skilled, and characteristically are at a stage in their life when they have family responsibilities, where they have to make a break with their professional careers, and however they may be interested in this, they really cannot normally be expected to take these assignments unless they can get a salary that is comparable to what they are accustomed to getting.

There is no question that it does set up difficulties, and that is one of the reasons why our main emphasis is on developing their own capabilities. We are going, as we mentioned in our presentation earlier, to what we call "third country training", which means taking people from one developing country and training them in another developing country,

• 1610

posts. There is a great variety of posts, everything from wild game management to advising presidents and prime ministers. This is why you cannot have a canned answer for how each of these people should live. They

because it is true that the things you point to do constitute problems.

Mr. Howard (Okanagan-Boundary): Working, as you are, as a government department, do you feel that this is a satisfactory arrangement for something which is quite different from most government departments? I presume that you are required to hire through the Public Service Commission and follow all the necessary procedures of government service? Would you not be in a better position, for instance, as a Crown Corporation?

Mr. Strong: Let me say only that there is no question that there are a lot of special difficulties related to the operation of a program that extends beyond Canada into a number of other countries. It involves cultural barriers, language barriers, intergovernmental relationships, and these do require special administrative flexibilities and we have been successful in getting a bit of relief here and there from some of the rigidities that necessarily prevail in the operation of domestic programs. I would have to say that I think our program would be improved if we had more flexibility. I think there is a general understanding of this within the government and there are obvious problems related to accomplishing this about which I have to be patient and understanding too.

Mr. Nesbitt: Mr. Chairman, on a supplementary.

The Chairman: Mr. Nesbitt, on a supplementary.

Mr. Nesbitt: Does not the government of the United Kingdom get around this problem by excluding all of their foreign service from the regular requirements of the public service commission?

Mr. Strong: I do not know that the foreign service as a whole is excluded. They have their own rules and regulations.

Mr. Nesbitt: I meant excluded from the general rules of the British public service.

Mr. Strong: Yes, I think they do have, but I do not think this applies to the actual operation of their aid program any more than it applies to the operation of their diplomatic missions.

Mr. Nesbitt: No, but it applies generally to that whole field?

Mr. Strong: Yes, I think that is correct.

The Chairman: Mr. Cafik? On a supplementary, Mr. Prud'homme.

[Interpretation]

Mr. Prud'homme: A supplementary question. You would be happier if you had more latitude as far as this problem is concerned. Is this what I should deduce? It is very interesting and very important for us to know this, because we would have the same fears that you have, i.e. the lack of flexibility of the public Service.

[English]

Mr. Strong: I am not sure the extent to which I should allow my personal feelings on the subject to influence my answer, but in all honesty I would have to say that I think we are making progress but that it is not really feasible to run a good aid program when subject to all the conventional rigidities that apply to domestic public service operations.

[Interpretation]

Mr. Prud'homme: I agree with you.

[English]

• 1615

Mr. Cafik: Mr. Strong, my questions are related to some extent to those raised by Mr. Howard and by some other members. I want to compliment you on the presentation that was made today. I agree with Mr. Laniel that it would be important to get this kind of message across to the Canadian people, particularly, the younger people of Canada. I am proud, frankly, of the efforts made by your Department in helping underdeveloped countries. I would like to see, however, a little more effort, perhaps, being taken in encouraging the individual members of our society—business, individual people, particularly young people—in involving themselves more directly in this work in a voluntary way, and this has been alluded to. I wonder what you think in terms of, for instance, industry itself. I do not see any reason why some of our larger corporations, who have many skilled people who I am sure would be very useful in the work that you are doing, should not be encouraged to donate such personnel for a one, or two, or three year period. Is this being done, or is any encouragement being given in this direction?

Mr. Strong: Yes, I very much agree that this is an important program emphasis. We have made what I think are some pretty significant beginnings in this area. In the last year we initiated what we call our private agencies program. We have set up a special

division for this purpose and this has succeeded, I believe, inducing a great deal more of the kind of activity to which you refer involving participation by individuals through their own private voluntary organizations in a much wider range of international development activities.

We have also recently set up a business and industry division, the purpose of which is to enlist the co-operation and support of Canadian business and industry and, also, to bring to their attention opportunities which exist for them in developing countries.

I think the Canadian Executive Service Overseas, which was founded with the assistance of our office, and with the assistance of its predecessor CUSO, is a good example. Here we have a board of about 70 of the leading businessmen in Canada. It is staffed entirely by retired businessmen or businessmen who were prepared to take early retirement in order to work at this activity and there is a growing stream of business people who are going out to developing countries under this program. We have also in our office a number of people who have come forward from the business world and who have volunteered either at no salary or at a very much reduced salary.

We have got the vice-president of one of the leading advertising firms in Canada, who is undertaking a seminar at a very nominal remuneration to him; it is just a fraction of what he would command in private life. He is undertaking to put on seminars across the country in response to the requests we have been receiving from communities for a greater amount of information on aid and development.

We also have a number of senior advisers who have come to us under special contracts at salaries considerably less than what they command in private life.

So, I would agree that this is an important area and we have certainly been attempting to illustrate the importance we attach to it by the programs we have initiated in this area.

Mr. Cafik: Have any specific requests or approaches been made to specific businesses, for instance, where they may have specialized personnel who are capable of doing this work and who you might think could well afford to donate such persons? Is this type of approach being made to individual firms?

Mr. Strong: Indeed. As a matter of fact, business firms are one of our principal sources of expertise. Let me just mention, for

• 1620

example, the food industry: the food industry in Canada has done something that is relatively unique. It raised money from amongst its own members and promoted a program of providing assistance to developing countries in the field of food technology. One of our leading grocery chains, whose chairman has taken a real lead in this area, has also been willing to free up some of his own senior personnel to undertake specialized assignments for us in developing countries. I think that the food industry as a whole, because of its involvement in this Mysore project, first of all, and what they now call the Canada Plus One project, has really opened itself up to the whole field of international development. As a result, its interest has grown and its willingness to help us with skilled people has grown considerably.

Mr. Cafik: Now a question in respect to the soft loans that you referred to. I gather they are interest-free for the entire 50-year period; is that correct?

Mr. Strong: That is correct.

Mr. Cafik: I wonder, following this same theme of involvement of the private sector in the work that you are doing, has any thought ever been given to perhaps issuing interest-free development bonds, as it were, that people might invest in this? They would get their capital back in due course, but there would be no interest; thereby the charge to this government would be less and perhaps the availability of funds more. Has any thought been given to this type of approach?

Mr. Strong: It is a very interesting suggestion. I am not so sure that it is appropriate for me to comment in the sense that we are responsible for the spending of the money and not for the raising of it. However, it is certainly a very interesting suggestion.

Mr. Cafik: I have one last question along this same line again. At one time, a little while ago, a particular Minister talked in terms, perhaps, of a youth corps of some kind or a youth draft that might be used in this area. I wonder what your thoughts are in that regard, or, if failing a type of draft, at least to take advantage of the thousands of highly motivated young people in our country today who really have something to offer and do not seem to have an adequate vehicle through which to offer it?

Mr. Strong: We do not have a direct program in our own agency for this purpose. The reason we do not is that there is a much more effective program being operated by a private agency, CUSO. We feel this agency is able to deal very effectively with the provision of opportunities for young people to do meaningful, useful things in the developing countries. Because of that, we have supported to a very sizeable extent the CUSO budget and its expansion. It has been expanding at a rate that is, I think, pretty consistent with its capabilities administratively of handling that expansion.

There have been ideas for a much broader youth program, but many of the ideas that I have seen put forward in this area have been more addressed to the problem of involving Canadian youth for the value of the experience to them rather than for the value of their contribution to developing countries. I think it has to be appreciated that there is quite a difference here.

Mr. Cafik: Yes, I think it could not help but have both effects nonetheless. On this thing with CUSO, as a matter of information, is it a necessary prerequisite that the volunteers in CUSO be university students, or is this open to any citizen, any young person in Canada?

Mr. Strong: I understand it is open to any person and it is not confined to young persons. CUSO started off, of course, principally as a university enterprise. It has, in fact, grown because of the tremendous support it has received from the universities and it continues to receive that support. However, it has broadened its activities to make it possible now for people of really all ages—I am not sure what their minimum age is, 18, 19 or something like that—but there is no upper range. I think there are CUSO volunteers who are over 60, in fact one or two who have been over 70.

Mr. Cafik: Fine, thank you very much.

• 1625

The Chairman: Mr. Lewis.

Mr. Lewis: Mr. Strong, I want to pursue with you a different line, if I may. I have not looked through the material that was just given us so I will have to refer to a return which was tabled on April 2 in reply to some questions I put on the Order Paper. The answers were, no doubt, prepared by your division.

I noticed with some concern the gap between the appropriations and the expenditures, year by year. Beginning with 1964-65, Parliament voted \$226 million; it is given as \$224 million, I think, on your Table II. The expenditures, according to the return in that year, were \$152.5 million, and in 1965-66 it was an expenditure of \$143.7 million as against an appropriation of \$214.7 million and so on down the line every year. My arithmetic for the years 1964 to 1968, the four years inclusive, shows that over that period of four years you spent only just under 71 per cent of the amounts voted by Parliament. I appreciate that some would be carried over from one year to the other, that is why I took for my guidance the four-year period rather than year-by-year. It seems to indicate to me a failure somewhere of planning in your division or something. Our total appropriations are not so large that it is a matter of satisfaction to see that even the amounts we do vote in Parliament are not used up. What is the explanation for that?

Mr. Strong: Mr. Chairman, this is a very important question. I think it should be understood that there are really two main explanations here. One is inherent in the lag that necessarily always exists between appropriations and expenditures, which I will come back to, and the second is the peculiar conditions surrounding the program the last couple of years while we have been experiencing a major re-organization.

On the first question, when Parliament votes funds—except for food and commodity aid, which are quickly dispersed in the sense that you simply buy the food or the commodities and ship them—a good deal of our aid is given in the form of projects, some of them capital projects or some of them technical assistance projects. These projects require a good deal of time to develop and to implement.

When you start to build a school, you first of all have to do the planning. You do a feasibility study and then you do a plan and you have to get agreement of each stage with the government concerned and then you have to start implementing it. These projects may take five or six or even seven years in some cases to complete. The expenditures in the first year may be very, very minor. The total expenditure is made over a period of a number of years. So when you have an increasing program you inherently are bound to have a considerable lag between the level of each

year's appropriations and the level of that year's expenditures.

Secondarily, and peculiar really to the last couple of years, we have been going through a period of rigid evaluation of the experience that we have had in the aid field since 1950 when we began. We were not at all satisfied with our own planning procedures, with our own procedures for evaluating projects and with our own procedures for implementing them. That is not to say we are in any way trying to criticize what has gone on in the past because we were dealing to some extent in the dark in the past. All aid agencies have had this problem. Our experience has been relatively limited.

We have had enough experience now to be able to apply its lessons to trying to produce a better program.

As the person responsible administratively, I was just not prepared to see us spend money on things that I did not feel were well-planned or well-conceived or where the money could not be effectively spent. So we have concentrated the last couple of years on trying to give ourselves the kind of organizational machinery that will permit us to spend this money effectively. It is inevitable that during this period the normal lag between appropriations and expenditures has become somewhat exaggerated. I am satisfied that it is a very temporary thing. I feel it is justified. I feel we will have a better program because of it and I think we will have a better capability of reporting increased expenditures to you in the future.

• 1630

Mr. Lewis: With great respect, Mr. Strong, I want to tell you frankly that what you have said does not satisfy me. I was almost going to say it does not impress me at all. First, you are doing yourself an injustice. The actual percentage of expenditure to appropriation in the two years that you have been director has not gone down. When did you start, if I may ask?

Mr. Strong: About three years ago.

Mr. Lewis: About three years ago. In 1966-67 it was 78.9 per cent, and in 1967-68 it was 68 per cent as compared to two-thirds in 1965-66 and two-thirds in 1964-65. So that the factual basis of your answer is not supported by the figures. Since you have taken over the percentage, the proportion, of appropriations actually spent has not decreased.

This is what I could not understand when this was first drawn to my attention and I ask these questions; surely when Parliament is asked to vote a certain amount of money I assume that it is asked to do so because of some representations made by your predecessor, or by yourself, to the government. I assume those representations are related to plans that you have already investigated. You do not pull figures out of the air. I hope that when you ask the government for a certain appropriation for a year it is because you have forecast the likely expenditures you will have based on the studies made and on the plans that you have for that year. If that is not the case, I would like to know how you do arrive at the figures and why there is this lack of planning in the appropriations requested. There must be a lack of planning or this result would not be there.

Mr. Strong: Well let me answer your two questions basically. First, to explain what I meant when I said that the lag has been greater during the last two years, that does not necessarily tie directly into the figures simply because as I mentioned earlier, the expenditures are a product of a pattern which takes place over a period of years. The expenditures were actually less. Our program was slowed up during this period; I assure you I am accurately reporting this. It slowed up beyond what it would have been had we not been going through this reorganization. I did not say that it had been reduced either absolutely or as a percentage of total. In fact the expenditures, and more particularly the rate of new commitment, has been slowed up. That will have an effect over a period of the next several years but it will be a lessening effect as the period lengthens out.

Second, on your over-all question, the aid program in all countries is peculiar in the sense that there is for all practical purposes an almost unlimited need for aid; certainly, in terms of anything that is now being done. So the constraint is on the speed with which governments are prepared to move up their aid budgets.

A budget is not put together really, like budgets of other departments, on the basis of taking planned projects and determining what they are going to cost and then petitioning the government for financing on that basis; it is based on the fact that there are very large needs. We must be in a position to know what the government is going to spend before we can commit on programs. We have

known for some time the government's policy of moving its budget up and we have assumed in our planning that there would be an increase. We would have been able to increase our expenditures in the last couple of years quite a lot had we not taken the attitude that I was referring to earlier; that we wanted to take a complete new look at our standard of planning and evaluation. It

• 1635

would have been possible to increase our expenditures considerably over this last couple of years.

Mr. Lewis: But is your study complete?

Mr. Strong: Oh, yes.

Mr. Lewis: Or is there going to be a longer delay; two years seems to me to be a fairly good time.

Mr. Strong: No, I think that is true. It is not just a matter of thinking it through. We did not have, for example, any economists on our staff two years ago. We had one or two people with economics training, but they were not practising economists. It is pretty difficult to make a really good evaluation of a country's development plan and its progress in the development field without having some economic expertise. So we have had to get these people and we have had to put them together in team that can be evaluating.

Mr. Lewis: Do you mean that from 1951 to 1967 there was not an economist in the External Aid division?

Mr. Strong: That is right.

Mr. Lewis: That is a revelation worth having, Mr. Strong. What other expertise did the division lack that you acquired in the last two years in your restudy?

Mr. Strong: I think it should be explained that the lack of these people does not necessarily mean that you could not have a good program; our program was not big enough at that stage to justify a lot of these things. However, when we are going into a larger program, and we are concentrating that program, we really do have to have a fair amount of professional expertise, not only economists but expertise in some of the particular sectors we deal in.

We found, for example, that agriculture is a very major element in our program and we really had nobody on our staff who was able

to assess our agricultural programs as agricultural programs. We now have a senior advisor who is able to help us evaluate the requests we receive in the agricultural fields by using professional criteria related to his own profession in the field of agriculture.

Mr. Lewis: Where did you get him?

Mr. Strong: He is Dean Bentley, Dean of Agriculture for the University of Alberta.

Mr. Lewis: When did you get him?

Mr. Strong: About a year ago. We also have a man in forestry, because forestry programs are important. We have a special adviser who helps us evaluate the professional aspects of our forestry programs. We have a man in the fisheries field who helps us evaluate the professional aspects of our fisheries programs.

Mr. Lewis: All of these people have been retained in the last year or so?

Mr. Strong: Yes. It takes a while to actually integrate, to get competent people, to make them a real ongoing part of your organization.

Mr. Lewis: I think, Mr. Strong, you and your colleagues have justified your appointment as far as I am concerned. I am just surprised beyond words that these things have happened only in the past year. May I ask you this. Sometime ago, I have not got the date, a Mr. Chambers in your organization...

Mr. Strong: Yes.

Mr. Lewis: ...made a statement, I think to this Committee, that 1 per cent of national income target or 1 per cent of GNP target—I forget which one he was dealing with at the time, I think it was GNP—was not likely to be reached by 1975, if I represent what he said correctly and I think I do. Is that still the thinking of the agency?

Mr. Strong: We have had discussions on this and I think Mr. Chambers who is here would say that what he intended to relate at that point was that if you took mathematically the present rates of increase and extrapolated them you would not reach it by that point.

• 1640

Mr. Lewis: I agree with that, although I did not work out the exact year. I wanted to ask whether it is still the thinking of your agency that the most recent UNCTAD target

of 1 per cent of GNP will not be reached in Canada before 1975?

Mr. Strong: This is not really for me to say, I can only report to you what has been done. I would refer you to the fact that the government has said on several occasions that it intends to reach the international target; that is, the original UN target.

Mr. Lewis: Yes.

Mr. Strong: Based on gross national product at market prices, or at factor cost, I guess.

Mr. Lewis: National income was the original one.

Mr. Strong: By the early 1970s. The government is on record as saying that. The government also voted affirmatively on the redefinition by the last UNCTAD meeting in New Delhi of the target to put it on the basis of gross national product, but it established no date by which Canada intended to reach that.

Mr. Chairman: Would you permit a supplementary by Mr. Thompson?

Mr. Lewis: Yes.

Mr. Thompson (Red Deer): My question is supplementary, Mr. Chairman. I do not say this criticizing the fact that we are spending too much; we are not spending enough, but on the basis of the statistics that you have given in your annual report, we will never reach 1 per cent because we are going downhill. We reached a peak in 1966 of 67 per cent of gross national income, we went down the next year to 59 and this year we are down to 50 per cent. When you compare that with the various countries that are listed here, we are the lowest of all the countries that are participating as "have nations" under UNCTAD and this concerns me.

Mr. Strong: I think you have to realize that the figures for a given year do include some distortions. For instance, there are substantial amounts of food aid in some of the years in response to emergencies or substantial amounts of uncontrollable, on our part, Export Credit loans. Actually if you look back a little bit beyond the years that you mentioned . .

Mr. Thompson (Red Deer): Then we were on the upward incline until 1967. Since then we have been on the downward trend.

Mr. Strong: Yes, but in terms of absolute values we have been increasing. One of the

problems—it is a good problem, I guess, for Canada—is that our GNP during these periods has increased at a faster rate than that on which the original estimates had been based.

Mr. Thompson (Red Deer): I would like to see this related to GNP. This is related to gross national income. If it were related to GNP it would be much worse.

Mr. Lewis: The national income, of course, goes up with your GNP.

Mr. Thompson (Red Deer): I know, but the percentage is much worse.

Mr. Lewis: The percentage would be worse. Having seen these figures, having seen the not very edifying performance of Canada as a proportion of national income over the years and having read the criticisms of DAC—the Development Assistance Committee—of OECD about Canada's performance, I would like to ask you—if you can answer and if you feel free to answer—whether your Agency has been asked by the government to prepare a program of expenditures which over two, three or four years would reach the UNCTAD target?

Mr. Strong: I think I could say that we now take this into account because the latest UNCTAD target, as I explained, is not a commitment by the government to any particular period of time, but we certainly have all of the planning necessary to permit us to increase our aid program to reach the announced government intention of achieving 1 per cent by the early 1970's.

Mr. Lewis: Can we talk simple figures? I am not an economic expert or a statistician. We now spend, including the Export Credits things which are really loans at a rate of interest—if you took them out, you would have much less—between five-tenths and six-tenths of 1 per cent of the gross national income or somewhere in there. In order to make that gross national product as distinct from gross national income, you would immediately have to increase by some 20 per cent. Is that not right? Is that not about the difference?

Mr. Strong: Right now, Canada's gross national product is, I believe, something in the order of \$67 billion?

Mr. Lewis: Yes.

Mr. Strong: On that basis today, 1 per cent would be \$670 million and if you assume .2 of

1 per cent to cover private flows, the official program would have to be about .8 which would be roughly \$500 million or something in the order of...

Mr. Lewis: As of today.

Mr. Strong: As of today...

Mr. Lewis: Assuming a modest increase in gross national product of 4 to 5 per cent a

• 1645

year—whether it is constant dollars or current dollars, let us not get into that—but assuming that kind of increase, you would have to increase your present program of about \$300 million by an average of at least 20 per cent per year to arrive at the 1 per cent in 1974, would you not?

Mr. Strong: I think that is a pretty fair statement.

Mr. Lewis: So Mr. Chambers was not far out because the likelihood of an increase of more than 20 per cent per year is not very great unless the government really is prepared to give it a serious boost.

Mr. Strong: There is no question that increases in the GNP each year obviously extend the amount by which you have to increase your aid program.

Mr. Thompson (Red Deer): So they should.

Mr. Strong: Certainly, but if Canada's GNP grows at 6 per cent, that is \$5 million a year...

An hon. Member: Roughly.

Mr. Strong: About \$4.5 million a year, it would take just 1 per cent of that increase to make...

Mr. Lewis: About \$40 million.

Mr. Strong: Yes.

Mr. Lewis: May I ask one other set of questions? I have some more on this score, but perhaps others will pursue it. For the past three years you have been making a study of reorganization, a study of programs and so on. Could you tell this Committee, to the extent that it is not classified or secret which I hope much of it is not, exactly what were the points that were concerning you? What kind of programs did you find in your study was not entirely sensible and what kind of improvement did you find was necessary to

make more sensible programs? I know this is a very broad question, but I, as one member, and I am sure other members of the Committee would like to know what you came up against in your study and what improvement you thought ought to be made in the programs?

Mr. Strong: I cannot give you too long an answer to that question.

Mr. Lewis: Quite objectively.

Mr. Strong: First of all, let me say that when talking about change—and about improvements and changes—I do not want in any way to imply any reflection on the previous administration because aid programs are very new and anybody responsible for our program at this stage would obviously look at and apply the lessons of the past. It is not a matter of looking critically at the past, but of looking constructively at the future.

Mr. Lewis: You can take for granted we understand that.

Mr. Strong: One of the important areas, of course was this very one that you have been highlighting the realization that our program was going to expand to a very large program and the processes and the procedures that were appropriate to a much smaller program really were not going to permit us to spend effectively the much larger amounts of money that would be involved in the government's commitment to 1 per cent. This was one thing. We realized we had to be more professional; we had to realize this was a long-range commitment and that it was not just a year by year ad hoc response to emergencies, but a long-range process of Canadian involvement in development. This meant that we had to bring in people who had professional expertise in the various areas that I referred to, so one of the jobs was an organizational job.

Then, in looking at our actual programs, we have had to review—some of this has been done and some of this is in the process of being done—such things as the role of Canadian institutions outside of government, knowing that really our agency cannot be a resource in itself. The purpose of our agency is to relate Canadian resources to the needs of developing countries. Inherently, that means we must have a knowledge of the needs in the developing countries, we must have a knowledge of Canadian resources and we must have the kind of expertise that will

permit us to reach into Canadian society to tap the resources and create a program that relates them to the needs. Obviously we have to involve many of these institutions as institutions, so we have to know what kind of resources there are in these institutions. The universities are very good examples.

Mr. Lewis: Excuse me for interrupting, but the answer you have given deals with Canada...

Mr. Strong: Yes.

Mr. Lewis: ... with the same kind of thing you have to do in Canada.

Mr. Strong: Yes.

Mr. Lewis: Are your studies not concerned with the kind of program we enter into from

• 1650

the point of view of the needs of the recipient country and have you found that some of the programs we undertook earlier may not have been the wisest from the point of view of the recipient country? I am sure you are as anxious as I am to think from their point of view as well as from the administrative, bureaucratic Canadian point of view.

Mr. Strong: I was coming to that because on the one hand we have been looking at our resources, realizing we are going to need more of them and, therefore, we have to have a better understanding of where they are and under what conditions they can be made available to us in Canada. So we have had a number of studies including, for example, a study by the Association of Universities and Colleges of Canada of the resources available throughout the Canadian universities. Then looking, quite rightly, as you said, at the developing countries, we have been doing a number of studies of their own needs, on the one hand, and the special ways in which we could meet those needs. A good example is in the agricultural field. I think we have referred in our presentation to an agricultural task force. India is the biggest single recipient of Canadian aid. One of India's principal problems is an agricultural problem.

Mr. Lewis: Famine.

Mr. Strong: Rather than just sit back and wait to receive requests from the Indians, we decided to get together a group of leading Canadian experts in various aspects of the food and agricultural field, send them out to

India after quite a long period of preparation here, and have them do an in-depth study of the needs of Indian agriculture related to those things in which we can help the Indians. Out of that we have developed, through a process of dialogue with them, an understanding on both our part and theirs, of the particular ways in which we can help them most. Out of this process, they are making requests to us for help.

Mr. Lewis: Are they participating in this study?

Mr. Strong: Oh yes, the team was Canadian, but it went out to India and worked very closely with the Indians. After receiving their report, we worked out a program with the Indians which is based on that report. As a result, they now know the areas in which we can help them best, and we know the areas in which they have the greatest needs. Therefore, the projects that they are now requesting from us are made within the framework of this understanding. They are not just made in the dark. We have a set of guidelines for the next five years or more which will help us to rationalize our program and to do those things that we are most capable of doing.

Mr. Lewis: Have you done this in other fields, in other countries?

Mr. Strong: Yes, Ceylon is another area of concentration. We employed a very high-grade, knowledgeable expert in the field of development who spent several months in Ceylon making a detailed review of our entire program; taking the World Bank and other reports on Ceylon's development, reviewing the things needed for the next five years, and working out with the Ceylonese a strategy for Canadian aid in Ceylon for the next five-year period, identifying a number of particular sectors in which we should specialize.

Mr. Lewis: Excuse me for interrupting. To what extent do you make these studies in your agency in consultation and co-operation with the multilateral agencies such as the UN Technical Assistance Board, other UN agencies, the World Bank and so on? To what extent are we carrying on studies on a purely bilateral basis? This makes me very unhappy. One of the things that I think is wrong, if I may say so without being too presumptuous, is that the total aid field in the world is far too bilateral in the case of our country and the United States and not sufficiently multilateral through international agencies so that

the "ugly American" problem would disappear. You would not have Canada versus somebody; there would be a multilateral agency.

To what extent are we doing these studies and making our decisions, even in the bilateral sphere, on the basis of consultation and co-operation with multilateral agencies?

Mr. Strong: Our starting point is the existing knowledge. We begin with the World Bank studies and the U.N.D.P. information. We, as members of these organizations, of course, get this information. This, combined with the development plan of the country concerned is the way in which we carry out these studies. Our job is not to duplicate the

• 1655

efforts of others, but really to look at those particular areas which are of concern to our program. Our studies are related to developing a Canadian program, and that means we must know what others are doing so that we may select the areas in which we can make our best contribution. However, in the process of doing this, we too make a contribution to the store of international knowledge. I have just come back from an important agricultural meeting in Europe, where we had most of the key people associated with the agriculture revolution. I was told by the Chairman of the Development Assistance Committee that the report of our agricultural task force was the best contribution he had seen to this whole agricultural field. We take something from the international experience and we like to think that we do make a contribution to it too.

Mr. Lewis: Do you want to stop me, Mr. Chairman?

The Chairman: We do have quite a few others who want to ask questions, but continue, Mr. Lewis.

Mr. Lewis: May I take you to one other point? Are you attempting to stimulate private investment in the developing nations?

Mr. Strong: We are attempting to stimulate interest in Canada in investing in those developing nations where the nations themselves here, or do you let our industry and business have a policy of encouraging private investment. We have no policy of urging the countries themselves to do this if this is not something that they already want to do.

Mr. Lewis: What do you do in that respect, if I may ask specifically? Do you let the developing country know what might be available in Canada know what might be wanted in the developing country, or is it still a hope?

Mr. Strong: No, I would say we have made a rather modest start. Our program is not extensive in this area. We have really just started to do it on any scale. We have just set up the particular division for this purpose. The idea really is to provide information primarily to those Canadian companies, particularly smaller and medium sized companies, that are interested in extending their own operations into the developing countries. We provide information based on that which originates in the countries concerned.

Mr. Lewis: Is it equity investment that is going out? Are we going to be in the position of owning some proportion of somebody else's economy as our own is owned by somebody else, or are we providing loan capital to those countries?

Mr. Strong: No, it is usually a combination. These deals are worked out by the private companies concerned, but in general they would involve, I would think, equity and loan capital. However, the total amount of money we are speaking of here would be relatively small. In many ways the public sector is not really in a position to provide the combination of capital and technical assistance in some of the areas that we are talking about—in industrial plants, and so on. Under our system it is not really feasible for governments to make that kind of expertise available, except to the extent that private enterprise is willing to transfer its experience by making an equivalent facility in the developing country.

The Chairman: Mr. Fairweather has a supplementary question.

Mr. Fairweather: Mr. Chairman, I was struck this morning by your evidence concerning the Commonwealth Caribbean, and knowing the long history of the Canadian banking system there, I would like to ask specifically what the Canadian banks are doing over and above the pursuit of profit; what are they doing either in the development bank field or in concert with the development bank or on their own?

This seems to me to be an area where the experts are there, the money is certainly

there, and the moral obligation is there. What is happening to the Canadian banks in the Caribbean?

Mr. Strong: I could really give you only a general answer based on general knowledge. We do not have any specific figures, but from my general observations I would say that the Canadian banking community is very active down there. They, of course, accumulate sav-

• 1700

ings in their branch banking system there and so it does not always represent a transfer of resources from Canada. It is very often an accumulation of local resources and a reuse within the local area of those resources. I think about as much as I could say is that they are very active. We find them coming to us very often for information and taking an interest in particular projects.

We know that they provide financing locally for some of the projects that are, in part, financed indirectly by us through our aid programs, so we know they are very alert and active, but I could not put any figure on that opinion.

The Chairman: Mr. Nesbitt on a supplementary.

Mr. Nesbitt: Have any inquiries been made to the Canadian commercial banks in the Caribbean area with respect to making interim credit available, and I have in mind credit of the nature of the Farm Improvement Loans Act, and the Small Businesses Loans Act. I might say, in this regard, that I visited a number of the islands not long ago, and discussed the matter with representatives of two of the largest banks; they said they would be very interested in doing this if there could be some appropriate guarantee similar to the Farm Improvement Loans Act.

Mr. Strong: We have no fixed program at this point. We have not received, to my knowledge, any specific request of this kind; however, we do have a study under way at the present time of various ways in which assistance to private enterprise might complement and supplement our official aid program in the Caribbean area specifically.

Mr. Nesbitt: In Trinidad they wish to develop a certain variety of cattle raising and convert sugar cane raising to corn raising for beef cattle and they need this interim kind of capital for that purpose.

The Chairman: Mr. Nesbitt, you almost answered your own question. Mr. Lewis?

Mr. Lewis: Yes, I have one final question, Mr. Chairman. I offered to end whenever you told me to but I have a final question. I know the answer may be difficult, or there may be no answer. May I put it to you this way? I have done a little reading in this field over a number of years, and I have wondered a great deal about whether some of the developing countries are putting too much emphasis on industrial development as opposed to agricultural development thereby improving their methods of producing food for their people and putting that on a firm basis before any large part of available capital goes into industrial development. I appreciate there are some things that must be done such as building power grids of one sort or another for the future et cetera, but I wonder if in your studies you have reached any conclusion about that.

My attention, I may say, was first drawn to this by a long article I read several years ago on precisely this point—I cannot tell you where now, but I am sure it impressed me—this constant problem of providing food for the people so that at some point you get to the position where you can start accumulating capital instead of being constantly in the famine or hunger situation.

Mr. Strong: I think most people now looking back over the past two decades of experience in development would agree that probably too little emphasis was placed on agriculture up until recent years. It is I think, in the process of correction now. I do not think it necessarily follows that the efforts made at industrialization were necessarily wrong, it is just a matter of emphasis within the total approach. There is a lot of concern now being expressed through, about the future of industrialization because we see that one of the aspects of the agricultural revolution is that more food can be produced by fewer people. If you look at this in conjunction with the population increases, you can see that the number of people for whom jobs are going to have to be found in the next few years are very, very great. Many of these people can really only be employed in industrial-type operations. I think that without in any way detracting from the emphasis on agriculture, there is going to have to be a renewed emphasis again on industrialization, and the two have a very close relationship.

Mr. Lewis: To provide jobs for those displaced from the farms.

• 1705

Mr. Strong: Yes.

Mr. Lewis: Thank you, Mr. Chairman.

The Chairman: Gentlemen, perhaps we could pause here just for a moment. I had called a meeting of the steering committee, to discuss our future agendas and procedures, for 5.00 p.m. because I thought perhaps we would be finished with Mr. Strong and his assistants by that time. However, I still have seven members on my list who wish to ask questions. I certainly have no wish to rush the questioning or to bring it to an end because it has been extremely helpful. It occurs to me that if we thought we could finish say, by 6.00 p.m. or thereabouts this afternoon that we could continue now. Perhaps members of the steering committee who would be willing to meet tomorrow to deal with the matters we had intended to deal with this afternoon. What is the wish of the members of the Committee? Do you wish to continue.

Mr. Lewis: As one person who has taken, I am sure, a long time this afternoon I want to say Mr. Chairman, that I think this is as important a subject as any other we have before us as a Committee. Personally I would like to read the transcript of the presentation this morning to see if there are other questions that occur to me which I think need answering. In order to be able to ask them of Mr. Strong and his associates, I strongly urge the steering committee to plan for another day with these gentlemen if they can find one mutually suitable. Even though I have taken a long time, there are still a lot of things that I would like to ask about and I am sure there are other members who have many questions. I do not think we ought to try to end this part of our discussion in the next 55 minutes.

Mr. Thompson (Red Deer): My problem, Mr. Chairman is that there are other meetings and there is the work of the House as well. It is not possible to stay—

Mr. Lewis: The house is only dealing with abortion.

Mr. Thompson (Red Deer):—until 6.00 p.m.

The Chairman: Is it the wish then of the members of the Committee to adjourn now and work out another day. It might be rather

late in the month perhaps around May 20 or sooner.

Mr. Thompson (Red Deer): What about this evening, could we come back this evening?

The Chairman: We could come back this evening; would this meet your problem Mr. Lewis?

Mr. Lewis: I cannot make it.

Mr. Cafik: I do not mind, I have no objection if the Committee meets, although I think some of us may not be able to attend.

Mr. Lewis: I cannot be here but I cannot tell you not to meet because of that. I would still like to urge meeting another day, even if it is two or three weeks from now; there is no rush about this.

The Chairman: What is the wish generally of members of the Committee. Do you feel that we could spend another full day on this?

Mr. Howard (Okanagan Boundary): Mr. Chairman, I think that it is an important subject. We are faced with greatly increased expenditures in this field; we have not met our commitments thus far, and if other members have additional questions, I do not think we should curtail them if we can avoid it.

The Chairman: I do not think we should rush the questioning or bring it to a premature conclusion. I do not think there is much point in continuing now when some members who are interested have to leave unless we can pass the estimates today or tonight. If not, then I think we might just as well perhaps adjourn now. Mr. Stewart?

Mr. Stewart (Cochrane): Mr. Chairman, it is true that the subject is an important one but I do not know of any subject that comes before us that is not. It seems to me the most important thing that we have to do is to get on with our review and if the steering committee has to meet in order for us to be able to get on with that review then I think that should be done.

The Chairman: The steering committee can meet either today or tomorrow as far as that goes. I think the steering committee could work out its timing but it is a question of what the members now wish to do about these particular estimates.

Perhaps, in view of the number of members who have to leave, it might be well to

adjourn now and try to arrange another day with Mr. Strong, at which time we can continue our examination of these estimates with full time for everyone to carry on questioning. Mr. Legault, did you have a question that you wanted to ask?

Mr. Legault: I did, but I could forego it, Mr. Chairman. I was going to suggest that perhaps we could pass the estimates and then the steering committee could plan further. We are dealing mostly with the questions of policies, intentions, and of corrections that we could very well plan for at a future meeting which cannot be determined at this time. If we could pass the estimates now, this would be one thing.

Mr. Winch: Mr. Chairman, may I ask a question? Are we under any deadline as to when this Committee must refer back these estimates of Defence as soon as they are dealt with?

The Chairman: There has been no specific deadline given to me except that they are anxious to get them back as soon as possible. The Clerk tells me by the end of May.

• 1710

Mr. Winch: I asked the question because, as far as I personally am concerned, I would like to get the estimates through if it is going to restrain us from getting on with our policy review and other very important matters.

The Chairman: I do not think we should delay our policy review. I am going to submit to the steering committee, a program which I think we should carry through as far as our policy review is concerned. If it is necessary to hold special meetings in order to finish our estimates, then I think members should be prepared to do that without interfering with the general policy review. I assumed that this would be agreeable.

Mr. Winch: Did you say possibly "by the end of May"?

The Chairman: We must get the estimates back, the Clerk tells me, by the end of May. But we will be starting on our policy review, I hope, before that time. Mr. Prud'homme?

Mr. Prud'homme: I would go along with Mr. Legault's suggestion. My questions are not directly related to the Estimates; they are on the general policy of *L'Agence canadienne de développement*. Personally, I have no objection to voting on the Estimates today as

long as we make provision to call Mr. Strong and his advisers back. I have a series of questions that I am very much interested in, but I doubt very much if they will affect the voting on the Estimates. If there are no strong objections, perhaps we could agree to pass the Estimates today. Between now and the end of May, we will be pressed by other urgent business and we might not have time to pass the Estimates. We could pass the Estimates today and discuss this at another sitting on a day agreeable to Mr. Strong and the Committee. I am willing to go along with that.

Mr. Cafik: Mr. Chairman, it seems to me, and I may be wrong, that surely our over-all terms of reference for policy review and so on allow us to call Mr. Strong back any time we wish. I cannot see that the old traditional means of doing this by keeping the Estimates open is necessary. For that reason, I go along with other members who have spoken on this issue and propose that the Estimates be passed now.

The Chairman: Is that generally the feeling of the Committee?

Mr. Nesbitt: I agree in part that Mr. Cafik is quite right. There is only one thing, I think it would set a very bad example if these committees, which are supposed to be dealing with Estimates and taking the part of the role of the Opposition as they did when estimates were discussed in the House, were to deal with these Estimates by saying, "Well, we will be discussing them in some other way, so we are just going to pass them sort of without having considered them". I think we might be open to some rather severe criticism, and I do not think members of this Committee would want to set an example of just in practice getting rid of the government's spending Estimates without consideration.

I realize that because of the open policy review we have—and I quite agree with Mr. Cafik—in this particular instance it is probably quite all right because we can question Mr. Strong later. However, I think we might be setting a pretty unfortunate precedent in this new committee system we are trying out, a system which has not in some ways worked all that well so far without going into the details—I am sure everyone knows what I mean. I do not think it would be very good if we set this kind of an example. I just bring this to the Committee's attention as there might be a lot of criticism if we did.

Mr. Lewis: There is no need for it; we have a month.

The Chairman: As long as it is possible, I do not know what Mr. Strong's plans are; I understand he is going to be away a great deal in May.

Mr. Prud'homme: I propose that we vote.

The Chairman: Mr. Strong says he will make himself available, and I think Mr. Nesbitt has a point.

Mr. Prud'homme: Could we take a vote to find out the feeling of the Committee and if it is turned down we can come back again.

The Chairman: We do not have a quorum at the moment anyway. I am inclined to think the point made by Mr. Nesbitt is quite a sound one, although there would be no practical problem in this instance. As Mr. Strong will be available later in any event, and as long as members are prepared to come together to complete the hearing and pass the Estimates, I think my preference would be to do it on that basis rather than to pass the Estimates and then call Mr. Strong back later.

• 1715

Mr. Winch: I would like to make a suggestion because I understand you are having a meeting of the steering committee immediately after this Committee adjourns. We have not yet passed Defence Estimates, we have not yet passed External Affairs Estimates and I would like to suggest that the steering committee take it under advisement that no future general policy hearings be held until we have completed the Estimates.

The Chairman: That is a point which can be taken up at the steering committee meeting. Mr. Cafik.

Mr. Cafik: Mr. Chairman, without prolonging this any further, I have listened to the comments of the hon. member for Oxford and I think, perhaps, there is a great deal of merit in the consideration of the argument put forward by him. I certainly would not want to do anything to set a precedent indicating that committees do not take a thorough and proper look at Estimates, and perhaps we ought to let it sit.

The Chairman: That is our basic job and I think we should carry it through.

Mr. Lewis: D'accord.

The Chairman: D'accord? Then, perhaps we will adjourn, and arrange another time to discuss these Estimates with Mr. Strong.

On your behalf, I would like to thank Mr. Strong and his assistants very much for their presentation this morning and for the very frank answers they expressed this afternoon.

There will be a meeting of the steering committee in this room immediately after we adjourn.

Mr. Prud'homme: Before adjourning, I would like you to keep your list of speakers.

The Chairman: The list for the purposes of the record is: Messrs. Legault, Thompson, Prud'homme, Forrestall, Fairweather, Nesbitt, Ryan and then Mr. Nowlan on the second round.

HOUSE OF COMMONS

First Session—Twenty-eighth Parliament

1968-69

EXTERNAL AFFAIRS and NATIONAL DEFENCE

Chairman: Mr. IAN WAHN

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 40

THURSDAY, MAY 1, 1969

Respecting

Estimates, 1969-70, Department of National Defence.

WITNESSES:

(See Minutes of Proceedings)

STANDING COMMITTEE ON EXTERNAL AFFAIRS
AND NATIONAL DEFENCE

Chairman: Mr. Ian Wahn
Vice-Chairman: Mr. Perry Ryan

and Messrs.

Allmand	Guay (<i>St. Boniface</i>)	Nesbitt
Barrett	Harkness	Nowlan
Brewin	Howard (<i>Okanagan</i>	Penner
Buchanan	<i>Boundary</i>)	Prud'homme
Cafik	Laniel	¹ Roberts
Carter	Laprise	Stewart (<i>Cochrane</i>)
Fairweather	Legault	Stewart (<i>Marquette</i>)
Forrestall	Lewis	Thompson (<i>Red Deer</i>)
Gibson	MacLean	Winch—(30)
Groos	Marceau	

(Quorum 16)

Hugh R. Stewart,
Clerk of the Committee.

Pursuant to Standing Order 65(4) (b):

¹ Mr. Roberts replaced Mr. Anderson on April 30, 1969.

MINUTES OF PROCEEDINGS

Thursday, May 1, 1969.
(61)

The Standing Committee on External Affairs and National Defence met at 11:05 a.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Buchanan, Cafik, Gibson, Guay (*St. Boniface*), Harkness, Legault, Nowlan, Penner, Prud'homme, Ryan, Roberts, Stewart (*Marquette*), Stewart (*Cochrane*), Thompson (*Red Deer*), Wahn, Winch (17).

Witnesses: From the Department of National Defence: Dr. J. C. Arnell, Assistant Deputy Minister/Finance; Brigadier General S. M. Davis, Director General, Systems Management; Brigadier General G. R. Truemner, Director General, Personnel, Plans and Requirements; Colonel C. L. Kirby, Directorate of Operations, Deputy Chief Operations and Reserves.

The Committee resumed consideration of the Estimates 1969-70, Department of National Defence.

The questioning continued under *Items 15 and 20* relating to *Defence Services*. Dr. Arnell made a further statement regarding grants to *Canadian Universities—Military Studies* in the Prairie region. Dr. Arnell will provide additional information on aircraft as requested by Mr. Stewart (*Cochrane*).

The Chairman reported recommendations of the Subcommittee on Agenda and Procedure which were agreed to at its meeting on Tuesday, April 29, 1969. The recommendation concern a time-table for further meetings of the main Committee and a program of work for the continuing defence policy review. The Members concurred in these recommendations.

The Clerk was authorized to send copies of the working papers prepared by officials of the Department of National Defence, on the subject of North American Defence and strategic weapons systems, to those expert witnesses who have already appeared before the Committee, to the chairmen of departments of political science in all Canadian universities, to professors of military and strategic studies in Canada and to the editors of major Canadian daily newspapers, for their comments.

Members continued their questioning of Dr. Arnell, who was assisted by Brigadier General Davis, Brigadier General Truemner and Colonel Kirby.

The Vice-Chairman took the Chair at 11:40 a.m.

At 1:05 p.m., with the questioning continuing, the Committee adjourned until 3:30 p.m. this day.

AFTERNOON SITTING

(62)

The Standing Committee on External Affairs and National Defence met at 3:35 p.m. this day with the Chairman, Mr. Wahn, presiding.

Members present: Messrs. Allmand, Buchanan, Cafik, Gibson, Groos, Guay (*St. Boniface*), Harkness, Howard (*Okanagan Boundary*), Legault, Marceau, Penner, Prud'homme, Ryan, Roberts, Stewart (*Marquette*), Thompson (*Red Deer*), Wahn, Winch—(18).

Witnesses: Same as the morning sitting plus Mr. J. G. Grant, Superintendent Parliamentary Returns, Directorate of Information Services, Department of National Defence.

Members continued their questioning under Items 15 and 20 of the Estimates 1969-70 relating to the Department of National Defence.

Dr. Arnell was asked to provide additional information with respect to the terms of the contract with the Corps of Commissionaires and finances for the Town of Oromocto.

Items 15 and 20 were allowed to stand.

The Chairman called Items 25, 30, 35, 45, 48, 50 and Item 55, relating to Defence Construction (1951) Limited, which were discussed and allowed to stand.

At 5:50 p.m., the Committee adjourned, until 8:00 p.m. this day.

EVENING SITTING

(63)

The Standing Committee on External Affairs and National Defence met at 8:15 p.m. this day. The Chairman, Mr. Wahn, presided.

Members present: Messrs. Allmand, Buchanan, Cafik, Gibson, Groos, Guay (*St. Boniface*), Howard (*Okanagan Boundary*), Laniel, Legault, Marceau, Penner, Prud'homme, Ryan, Roberts, Stewart (*Marquette*), Stewart (*Cochrane*), Wahn, Winch—(18).

Witnesses: From the Department of National Defence: Dr. J. C. Arnell, Assistant Deputy Minister/Finance and Brigadier General D. R. Adamson, Director General Operations—Air.

Resuming consideration of the Estimates 1969-70, Department of National Defence, the Chairman called Items 15, 20, 25, 30, 35, 45, 48, 50, 55 which were severally carried.

Item 1 was called and carried, *on division*.

It was agreed, *on division*, that the Chairman should report the Estimates 1969-70 relating to the Department of National Defence and Defence Construction (1951) Limited, to the House.

There was a discussion concerning the CF-5 aircraft.

At 8:50 p.m. the Committee adjourned, until Tuesday, May 6, 1969, when the witness will be Lieutenant General F. R. Sharp, Deputy Commander of NORAD.

Hugh R. Stewart,
Clerk of the Committee

EVIDENCE

(Recorded by Electronic Apparatus)

Thursday, May 1, 1969.

The Chairman: Gentlemen, I think we can begin. At our last meeting we were on Votes 15 and 20 of the Department of National Defence and reached the point where we were dealing primarily with equipment. Dr. Arnell and his assistants are with us again this morning, so we will continue from that point. I believe Dr. Arnell has a few introductory remarks that he would like to make. Dr. Arnell.

Dr. J. C. Arnell, (Assistant Deputy Minister Finance, Department of National Defence): Thank you Mr. Chairman. Before discussing equipment, I think for the record, I would like to add one piece of information. At the meeting on the evening of April 17, I was asked a question regarding information about the universities that applied for participation in the strategic studies chairs, by Mr. Guay, and although I have not obtained full information from Mr. A. D. P. Heeney the Chairman—Selection of Committee on Professorships of Military and Strategic Studies—the group which does the selection outside the Department, I did find that the only Prairie university that applied for participation was the University of Calgary. There were no applications from either Manitoba or Saskatchewan. I would just like to put that into the record.

That I think, Mr. Chairman, is the only outstanding piece of information that we have been asked, which is not in the hands of the secretary.

The Chairman: Thank you, Dr. Arnell. I have names from the last session so I will call them. Mr. Roberts, and then Mr. Stewart. Mr. Roberts, I think you had a question from the last meeting.

Mr. Roberts: That is right, it is in relation to the External Affairs estimates that Mr. Cadieux reported to the Committee. I would still like to be kept at the top of your list.

The Chairman: Mr. Stewart?

Mr. Stewart, (Cochrane): I wonder if you could tell us how many aircraft there are in your Department—the Canadian Armed Forces?

Dr. Arnell: Could I, before trying to answer that, make a few remarks generally about the equipment side. I think then we might attempt to answer the question.

To help look at the equipment program, I would like to relate today's discussion to the piece of paper that I tabled—I think it was the night of April 17—which listed the selected major equipment items that were on procurement. At the time I said that this was an updating of the similar table that I produced for the Committee last November when we were looking at the 1968-69 Estimates. In order to allow the Committee to see the progress of the various procurement programs, we have attempted to present these two tables in essentially the same form. The other one appeared as Appendix "T" to the minutes of the 14th meeting. Also at that meeting I gave a short summary of the capital equipment program which is still essentially valid because there have been no new items in it.

The only other point that I would like to make is that, while last year's estimates were only in the blue book form, the distribution of capital moneys was in fact only shown by Command and in total. This year that information may also be found in the Blue Book on page 243. Moreover, on pages 27 through to 31, we have attempted to show, by equipment category, how the capital program is related to the various major activities, as revealed in the new form of estimates. I just wanted to put that into the record.

With respect to the numbers of aircraft, at the moment we have more than 1200 of 28 different types.

Mr. Stewart (Cochrane): 1200 aircraft?

Dr. Arnell: More than 1200 aircraft.

Mr. Stewart (Cochrane): There are, I realize, certain types of aircraft used with our squadrons overseas, certain types used for transport, and other types used for training purposes. Now, the point that I want specifically clarified is the number of aircraft maintained in order to provide continuous training for pilots. When I was in the air force, there was such a thing as risk pay or flying pay. I am wondering if this still exists, how much is involved in it and what are the criteria? In other words, is a fellow who is flying a

desk kept current through a program of training and how many aircraft would be used for this purpose?

● 1115

Dr. Arnell: I think the answer to your question, Mr. Stewart, would be that there is no proficiency flying as such for people at desks any more and, therefore, there is no flying pay, in the sense that there used to be, for people who were non-operational. When the pay system was entirely revamped in 1966, pilots were one of the groups which, in fact, had a separate pay scale along with several of the professional groups—the lawyers, the doctors, and so on. Pilots were essentially people who were actively operational, or were directly involved in operations. These, in fact, were the only people that were classed as pilots for the sense of drawing a pilot's salary.

Mr. Stewart (Cochrane): I see, Dr.

Dr. Arnell: What, I think, you were referring to was the old system under which there used to be small flights to various places, such as here at Ottawa. These were entirely provided for the headquarters people to do their proficiency flying. This no longer exists.

Mr. Stewart (Cochrane): I see. So there are no specific aircraft kept for that purpose then?

Dr. Arnell: No. A few senior officers are expected to stay current. The Brigadier General—who, in fact, is within the operational sub-branch of the Vice-Chief's organization and whose entire business these is to be the headquarters' link with operations—is a case in point.

Mr. Stewart (Cochrane): Well, Dr. Arnell, what about a squadron commander whom you bring back from Europe into headquarters and keep in an administrative job, or for a tour, for a year or so? What would he do about his flying?

Dr. Arnell: He stops flying. Anybody who is taken out of the operations, in fact, stops flying for the period. If he is to go back into flying—for I think the present philosophy is that he may not go back on the same aircraft that he was current on before—he would be phased back through the operational training unit before he went back into an operational job.

Mr. Stewart (Cochrane): I see. I wonder could we have some kind of a general idea of what all these aircraft are. 1200 aircraft sounds a sizeable number. Could we have some kind of a general breakdown as to how many would be used operationally and how many for other purposes?

Dr. Arnell: Perhaps the easiest way for me to obtain the information is to identify the main training aircraft and let you see the numbers which are involved.

The first of the training aircraft is, of course, the Chipmunk, of which we have listed 51. Of the Tudor, the next plane one might consider, we have 179. The conversion from pure training to getting into a little more sophisticated aircraft brings us to the T33, of which we have 204. I am not certain though, that those would be all training, but that identifies, after a fashion, the major training aircraft. Between 450 and 500 aircraft, therefore one could say are directly related to training as such. There are some aircraft in operational training units of which there are small numbers—conversion units and so on; and the rest have an operational role of some sort—search and rescue, transport, air defence and the like. Now, we could, in fact, provide a list of these, if desired, have it appended, and give the whole . . .

● 1120

Mr. Stewart (Cochrane): I think it might be helpful, Mr. Chairman, if we had that kind of a list.

Mr. Thompson (Red Deer): Mr. Chairman, may I ask a supplementary.

The Chairman: Mr. Thompson on a supplementary.

Mr. Thompson (Red Deer): I did not hear your figure on the number of Chipmunks. Besides, might I just add this question: with the non-continuance of the ab initio jet training program, what do you have in a propeller driven basic training aircraft other than the Chipmunk?

Dr. Arnell: The Chipmunk.

Mr. Thompson (Red Deer): Just the Chipmunk?

Dr. Arnell: Yes, the Chipmunk is, in fact, the only propeller . . .

Mr. Thompson (Red Deer): How many of those do you have?

Dr. Arnell: We have 51.

Mr. Thompson (Red Deer): Have you any intention of adding a new type of propeller driven aircraft in view of the small number of this type of aircraft?

Dr. Arnell: Not that I am aware of.

Mr. Stewart (Cochrane): Dr. Arnell, are any of these training aircraft used by auxiliary personnel or militia?

Dr. Arnell: No, I think only the armies that are in the auxiliary itself.

Mr. Stewart (Cochrane): We still have a number of auxiliary units across the country, do we?

Dr. Arnell: We have six.

Mr. Stewart (Cochrane): Is that in all the Canadian Forces, not only air?

Dr. Arnell: There are six reserve squadrons in air. There are, of course, the land force reserve and the maritime reserve as well.

Mr. Stewart (Cochrane): I understand that a few years ago there was a reduction in auxiliary forces. Is this continuing, or are they going to be maintained at the present strength, or increased?

Dr. Arnell: I cannot, in fact, make any prediction because at the moment, as you know, there is the whole question of the final examination of what is going to happen as a result of the recently announced policy by the Prime Minister. Studies are still under way concerning how some of the intentions of the government are to be met by restructuring the forces.

Mr. Stewart (Cochrane): I asked this because I would like to consider this question of our re-assessment of the forces. I think, perhaps, this could be an important point. I had the pleasure of serving for one year as a regular support officer to an auxiliary unit, and my recommendation at the end of my year's tour was that it be abandoned.

● 1125

I have a tendency to think, perhaps, all auxiliary units should be abandoned for reasons of economy and, also, because I feel that it is not possible to attain any degree of efficiency in that kind of a force, particularly, since we have a permanent force. That is why I wanted to consider this question of auxiliary units. Is there some kind of study going on in that regard?

Dr. Arnell: In the current examination of the entire defence establishment, the reserves, along with everything else, are being reviewed in the light of the recently stated policy. In answer to your question, I must say it is being examined along with everything else.

Mr. Stewart (Cochrane): Do you have an approximate figure in your over-all budget of what the reserves cost, including equipment and salaries? Is it \$50 million, \$100 million?

Dr. Arnell: The total cost of the reserves including cadets and some of the civil emergency operational support that we give, comes to \$45 million in total. \$3.7 million of this is capital. I am afraid I cannot subdivide it using the information I have here, but the bulk of that is certainly reserves.

Mr. Stewart (Cochrane): That is very good, Dr. Arnell. It gives us a general idea. It is somewhere close to \$50 million, in any case. Would fulltime civilians such as janitors who are required in the buildings that the government owns for these purposes be included in that as well?

Dr. Arnell: Yes, they would. As a matter of fact, the breakdown of the basic military personnel costs, which would be largely the reserve pay, plus those regular forces that work with the reserves to support them, is just over \$29 million. There is a civilian cost of just over \$3 million, and this is the janitors and the various civilian support.

Mr. Stewart (Cochrane): I see.

Dr. Arnell: So, about 10 per cent of it you could say is civilian support.

Mr. Stewart (Cochrane): Thank you very much, Dr. Arnell. Mr. Chairman, I wanted to talk about the navy, but I will come to that some time when we are talking about navy only.

The Chairman: Gentlemen, before continuing with the questioning, this might be an appropriate time for me to inform you of the recommendations of the steering subcommittee with regard to our future work.

The steering subcommittee has met and recommends that this Committee commence a policy review of all aspects of Canadian air defence, including NORAD. Included also would be a preliminary examination of the implications for Canada of the American anti-ballistic missile defence, the ABMs. In the hope that this would meet with your approval, we have already requested the Department of National Revenue to prepare a comprehensive working paper on this subject.

Mr. Harkness: The Department of National Revenue?

The Chairman: The Department of National Defence. The Committee expects to discuss this working paper with General Sharp, the Deputy Commander of NORAD next Tuesday, May 6, if it is decided this program meets with the approval of the Committee.

The Minister of National Defence and the Minister of External Affairs will be asked to appear before the Committee on May 8 and there will be additional meetings on NORAD and ABMs in May and June. As you know, we have scheduled May 15 for further examination of the Estimates of the Department of External Affairs and then CIDA estimates will also be coming back before us.

We would also like to arrange, if it meets with your approval, to submit this working paper from the

Department to an independent military commentator for critical evaluation and for a written report. Then, to encourage the widest possible participation and involvement it is proposed to send such working paper and critical report to those expert witnesses who have already appeared before the Committee, to the chairmen of departments of political science in all Canadian universities, to professors of military and strategic studies in Canada and to the editors of Canadian major daily newspapers, and that they be invited to assist the Committee in its work by giving the Committee comments in writing, including comments as to the objectivity and content of the working paper and critical report.

After considering the working paper and critical report, evidence presented to us and comments received from all sources, it is then proposed that the Committee would decide what questions require further investigation and after hearing any other evidence that may be required the Committee would then prepare its report.

It is also suggested by the steering committee that we commence a review of Maritime Command. A rather similar procedure would be followed. A basic working paper and critical evaluation would be obtained and circulated to the Committee's mailing list. We hope to establish a subcommittee of this Committee which would study these documents and any comments received, while our main Committee continued its review of NORAD and ABMs. Then, when the Committee has completed its work on NORAD and ABMs, we would go on to Maritime Command. The work of the Committee should be expedited as a result of the preliminary work done by the subcommittee.

The steering subcommittee also recommends that in the course of our future work we should make use of subcommittees to the greatest possible extent because it is felt that in no other way could we possibly cover in a reasonable time the wide reference given to the Committee by the House of Commons on January 16, 1969. You will recall that reference was to review and report on all aspects of Canada's external and defence policy.

In addition to NORAD and Maritime Command, the steering subcommittee has prepared a list of other possible subjects for review at an appropriate time. The specific items would include Northern and Arctic defence and sovereignty, civil defence, United Nations peacekeeping, disarmament, foreign aid—not necessarily in that order. In more general subjects in the field of external affairs, being considered for review by the steering subcommittee is included relations with the United States, relations with the United Nations, relations with South America, including OAS, and relations with the Pacific area.

This is quite a broad program; a very likely program. Of course, it would take a great deal of time to complete and these items which I have just mentioned are just being considered now by the steering subcommittee and the order will be determined in due course. However, we would commence on NORAD immediately if that meets with the approval of the Committee.

Mr. Winch: I would move acceptance of the recommendations of the steering committee.

The Chairman: I do not think we need a formal resolution, but is it generally agreed to proceed on this

● 1130

basis?

Some hon. Members: Agreed.

Mr. Stewart (Cochrane): Mr. Chairman, I assume that with the study of NORAD which would be undertaken immediately and the study of the ABMs as a part of that, the obvious place to get the bulk of our necessary information is Washington. Is this planned in the initial part of the review?

The Chairman: We are considering methods of getting the available material from the United States. Mr. Allmand.

Mr. Allmand: With regard to the meetings next week on Tuesday, you said the meetings are with whom?

The Chairman: Lieutenant-General F. R. Sharp. We will have the working paper, I understand, before that time perhaps for distribution on Monday.

Mr. Allmand: With General Sharp, will our questioning be directed to NORAD in general or to ABMs?

The Chairman: It really would be directed toward the working paper which is being prepared on NORAD, not on ABMs.

Mr. Allmand: I see. On Thursday with the ministers, will that be generally with respect to NORAD, or to both ABMS and NORAD?

The Chairman: It is intended that it should be on NORAD; that there be a technical briefing on ABMs at a later date in May.

Mr. Allmand: Could I suggest, although this was brought up by Mr. Stewart, that we try to get the testimony of the American Foreign Relations Committee, the Senate Committee, which has had hearings they started just before Easter, I believe, and continues after Easter on the ABM issue. It might be

valuable for us to have the booklets of their testimony available with the Clerk for consultation purposes because they questioned many expert witnesses on the subject and I think we could probably get them in Washington.

The Chairman: Thank you, Mr. Allmand. We will go into that as well. Today we have scheduled meetings that are required not only this morning but this afternoon and this evening. We really should try to finish the estimates of the Department of National Defence today, because as I mentioned, we also have the estimates of External Affairs and CIDA, and as I mentioned also, both ministers will be available later. I would hope therefore, that members would keep their questions as crisp as possible and that we could finish the questions some time today.

Mr. Nowlan: Mr. Chairman. Concerning the business of the future weeks or months, something that was mentioned the last time when we talked about our

● 1135

program, have you had any consultations with the Prime Minister or the Defence Minister as to the fact that this is all going to be done parallel to the Cabinet decision, or that they are going to hold up, as on the NATO thing, until we finally come in with our report on these various topics, or are we going to go ahead and make our own report regardless of what they say? I would be most interested in that frankly, but I just want to know what is the direction in relation to the Cabinet review itself on all these various questions that you mentioned.

The Chairman: I have discussed the question of NORAD, ABMs and Maritime Command with both ministers, and they seem to think, that this program made good sense. They did not indicate just when the Cabinet would be making decisions, or just what the Cabinet schedule is, but they did seem to think that our program would be useful.

Mr. Cafik: Mr. Chairman, there has been a couple of indications in the House that specific dates had already been determined for the bringing forward of reports on specific subjects of this policy review, and phase II of it. I wonder if that could be clarified so that all members of this Committee would know when the government intends to make statements in certain areas in order that we may judge our activities accordingly.

The Chairman: I will certainly try to get more definite information regarding matters which might affect our activities.

Mr. Nowlan: This is what I was directing my question to, in view of some of the statements that have

already been made; to make it a meaningful study by this Committee, as meaningful as can be. That may be in quotation marks.

The Chairman: Mr. Winch, you are next on the list of questioners.

Mr. Winch: Mr. Chairman. I have a number of questions on this phase of defence. Maybe I can restrict myself for the moment to one, and in order to expedite matters, on the first question I will make mention of both the army and of the navy so that there will be just one comment in reply. I am certain that this Committee is interested not only in costings but also in efficiency, and it is on that phase that I would like to have comments from Dr. Arnell.

I have been advised by military men that when we obtained the self-propelled or 155 mm guns, which have been in service now for some time, no spares whatsoever were obtained in the original position, that they have no traps, and no extra gun barrels, with the result that they are having to cannibalize on others. I am further advised also by military men that we made purchases of equipment from Italy because it was available and cheap, but also without spares with the result that they are having to, and have done for many months, cannibalize there also. On that phase, I think it would be interesting to have a comment as to whether one has to have a policy of purchasing a given number with no spares, or if it is not a better policy to lower the number of pieces of equipment and have spares. Along with that one phase of questioning on army equipment, I want to bring up the navy.

The Public Accounts Committee some few weeks ago made a visit to the *Bonaventure*. We saw there (I am going to give two examples) that in the refit, \$285,000 was spent on what is known as a Fresnel and landing equipment, highly sophisticated, with no spares. The result was that approximately five months ago when the heating elements had burned out in the lights, and they are very important, they endeavoured to get spares, and up until four weeks ago after five months endeavour, they still did not have any replacement spares for the Fresnel equipment, resulting in a great loss of efficiency.

● 1140

Also, just a little while ago we were discussing aircraft. The Tracker is the aircraft serviced by the *Bonaventure* and has highly sophisticated electronic equipment. Our subcommittee of the Public Accounts Committee visited the aircraft's electronic repair shop and discovered that the highly sophisticated electronic equipment as it breaks down has to be replaced with complete units which contain perhaps dozens of circuits, although only one is broken down, because

for 13 months they have been trying to get the specific type of soldering iron required in order to be able to make repairs. Since they have not received that piece of equipment yet—it is now 13 months—they have had to replace highly expensive electronic units, instead of being able to repair them. When we take the position, as I have outlined it—on our self-propelled 155mm gun, the equipment purchased from Italy, the position on the Fresnel and on the Tracker aircraft—I think that there is a logical question to ask from this Committee. What do you think of the policy and what do you think of what I maintain or allege, that this is high cost inefficiency in some regard?

Dr. Arnell: I cannot give you specific answers to several of your questions, Mr. Winch, although they may be able to dig them out for me. In respect to your self-propelled 155mm Howitzer question—when I was looking over the equipment procurement program that is in this year's estimates—one of the places where the program had decreased in price since I was before you last year, was in fact the self-propelled Howitzer. While investigating I obtained the information that the decrease was due to two things. One was that there had been a reprieve on the sales tax that we had expected to pay for, which in fact reduced the total cost: the other was that the spares that had originally been ordered for the 155mm Howitzer had, in fact, been cut back. After the guns had been introduced and the first experience of use was being gathered in the field, they found that they had, in fact, over-programmed the amount of spares for the gun. This was the information that I was specifically given on that particular item.

With respect to the Italian equipment, the information here does not, in fact, relate spares to the guns themselves, but I would have to check back and produce this.

Mr. Winch: My information advice is that when it was purchased there were no spares, so they cancelled that one.

Dr. Arnell: If they are the same guns that I am referring to here, they are for the DDH-280s which in fact...

Brigadier General S. M. Davis (Director General, Systems Management, Deputy Chief Engineering, Department of National Defence): I think Mr. Winch is probably referring to the 105mm Pack Howitzer which has just come into service.

Mr. Winch: Are there spares?

Brig. Gen. Davis: We are just establishing what precisely the spare situation is.

Dr. Arnell: We will try to get you an answer on that one.

Mr. Winch: How about...

Dr. Arnell: Again, are you trying to get the Fresnel...

Brig. Gen. Davis: There was an initial difficulty in procuring spares for the Fresnel lens system from the United States. I am now getting you more precise details on all of the items that you have just raised.

● 1145

Mr. Winch: The Fresnel was purchased through the U.S. Navy and as an operation on the ships in the U.S. Navy. Yet it is now over six months and they do not have this replacement part. There were none bought in the original purchase. Now, are you also getting the information of this amazing, extraordinary situation concerning the electronic equipment on the Tracker? They are not able to repair, so they must put in a complete new unit.

Dr. Arnell: I do not know about that situation Mr. Winch, but I do know that in a number of electronic equipments—and this has been the policy for years—it has been found cheaper and more efficient, when a particular piece of equipment goes unserviceable at the front line, to replace it and to repair it farther back in the second and third line maintenance. Quite frankly, I find myself in a slightly embarrassing position, with respect to your questions, because I presumed that these were being pursued in the Public Accounts Committee and I did not, in fact, come prepared to answer these questions.

Mr. Winch: Well, we have the information that this is the situation. My question to the Defence Committee was one of efficiency. A wonderful repair shop and highly trained technicians are available to repair—and it was drawn to our attention that they cannot repair, because they do not have this one piece of repair equipment. They have had it on order for over 12 months and they still have not received it. Therefore, they have to put in a complete new unit.

Dr. Arnell: Well, as General Davis said, he has sent out to get some information. I hope that we can give it to you later today.

Mr. Winch: Mr. Chairman, I have a number of other questions, but I do not want to hold up other members. Perhaps I should let my other questions wait until other members have had a chance to question the witnesses.

The Vice-Chairman: Mr. Winch, is there a bank of equipment in support of what is in operation at this site which you are discussing?

Mr. Winch: I am sorry, Mr. Chairman, would you repeat that?

The Vice-Chairman: Are there extra electronic boards that can be slipped in?

Mr. Winch: If you are referring to sophisticated equipment for the Tracker, they have a big supply on board of the complete units. It may have dozens of circuits. They must have them there and they do because if only one circuit breaks down, they cannot repair it. Therefore they have a big supply of the full units to put in, because they cannot repair even one circuit.

The Vice-Chairman: I think you should make it clear, Mr. Winch. How big are these complete units you are talking about.

Mr. Winch: Well, the complete unit is about the size of a cigar box. Under modern electronics, you can have dozens and dozens of circuits, since you do not have the wiring system that you previously had. It may fulfil a dozen or two dozen functions. If one breaks down, it is necessary to put in the whole unit, because they do not have the soldering iron—which must come from the manufacturer—in order to be able to repair it.

Dr. Arnell: I would like to conclude this by saying that subject to confirmation I think this may be a case of where the policy is. This is policy in commercial operation and industry as well. In many things of this type you provide replacement circuits rather than assume you are going to have someone who can fix it on the spot. You always get a man—I mean it is quite likely you will have a man up front who could fix this but you cannot be certain you will always have him. There is a lot of policy . . .

Mr. Winch: If I may tell you, a Chief Petty Officer informed our subcommittee—of which I was Chairman—that he had men who were fully qualified to repair this equipment, if they had that soldering iron.

Dr. Arnell: I am sure in that particular . . .

Mr. Stewart (Cochrane): In how many hours?

Mr. Winch: In about 20 minutes.

The Vice-Chairman: Mr. Guay on a supplementary.

Mr. Guay (St. Boniface): I would like to say to that it may even be cheaper to replace the entire unit when you take into consideration man hours and everything else involved. Although they may be able to repair it. I would agree with Dr. Arnell that it might be more economical to replace the whole unit. Therefore, on

that particular note, I think that we could probably get an answer.

Mr. Winch: I am sorry, sir, but I would not like to close on that particular note. I happen to know electronics; it is my trade. I can assure you that you could not repair it at a price that was approaching the full unit. As a matter of fact, it is my suspicion, that the reason why you do not have the repair cost is because the supplier will not supply it. He would rather sell you a full unit that be forced to make repairs of the ones that are broken.

Mr. Guay (St. Boniface): I have a supplementary, Mr. Chairman. Could Mr. Winch then give us more

• 1150

information if this is his speciality, his field? He certainly could give us more information to enlighten those of us who do know little about electronics.

The Vice-Chairman: Mr. Guay, we have an assurance from Dr. Arnell they will go into it thoroughly and that they will give us the complete picture. I think perhaps we should move along.

Mr. Guay (St. Boniface): Mr. Chairman, I do not want to sit here and listen to any member saying: "Ha, ha, ha, I know something I will not tell." If we have a question and we know some of the background, I think we should all be given the knowledge which pertains to that particular matter; then we and everyone else concerned will benefit, rather than go through a long period of questions and answers to see who is the best of the two.

Mr. Winch: May I just say—and I have right to say it here—it is not only my view that repair is much cheaper than a complete unit, but this matter was drawn to our attention by the Chief Petty Officer and his staff in the electronic repair room of the Tracker aircraft. That was their opinion as expressed to our Committee.

Mr. Guay (St. Boniface): There are just a lot of words, Mr. Chairman.

The Chairman: It will be elicited by Dr. Arnell later.

The next questioner, Mr. Thompson

Mr. Thompson (Red Deer): My questioning follows an altogether different vein, Mr. Chairman, Dr. Arnell. In the integration of the forces, what has happened to the army ground forces pilot training program and the propeller aircraft that they use in their normal communications and observer type of duty. Are these now all integrated into one or are they retained separately as before?

Dr. Arnell: The aircraft themselves are still retained. There are, in fact, the L-19's and this type of aircraft, the Cariboo in essence, or the Buffalo, which are directly related to the ground forces. However, the pilot training, *per se*, is integrated.

Mr. Thompson (Red Deer): Where does that take place at the present time?

Dr. Arnell: It takes place in the various flying training schools, which are Portage, Gimli . . .

Mr. Thompson (Red Deer): I am speaking now of elementary flying training. Do you have elementary training programs in Gimli and . . .

Dr. Arnell: Borden

Mr. Thompson (Red Deer): It is Borden, is it?

Dr. Arnell: Just to finish the answer, I think there is a single *ab initio* training program, and the policy has been all along to convert the pilot through the operational training unit to whatever particular role he was trained for.

Mr. Thompson (Red Deer): Is it true that you are tapering off the *ab initio* training program?

Dr. Arnell: Not that I am aware of. Our flying training program is directly related to the estimates of pilot requirements which, in fact, are made by the personnel people from their forecasts.

Mr. Thompson (Red Deer): That was not the question I was referring to. Are you continuing the program whereby you put the recruits directly into jet aircraft, as the *ab initio* training does, or are you discarding that and coming back to elementary training on propeller aircraft?

Dr. Arnell: A few do train Tudors but I think most of them still train in Chipmunks. Perhaps I could ask General Truemner to give you the facts of this particular case.

Brigadier General G. R. Truemner: All *ab initio* pilot trainees off the street, if you will accept that, still start in the Chipmunk program and from there go to the Tudors. You asked if we are tapering off the program. We have been cross-training certain people who were already in the service. If you have a feeling that fewer young men are coming off the street to pilot training, this is correct, but the pilot production program is carrying on.

Mr. Thompson (Red Deer): I am not as concerned about pilot production as I am about the method of training. My question relates to whether or not you are tapering off the *ab initio* approach to training and

concentrating in your elementary training on propeller aircraft, as has already happened in the U.S. airforce, or are you continuing with the *ab initio* training as it . . .

Brig. Gen. Truemner: Sir, *ab initio* means from the beginning.

Mr. Thompson (Red Deer): That is correct. Off the streets into jets.

Brig. Gen. Truemner: This occurs after 25 hours—it could be plus or minus 5—on the Chipmunk aircraft, which is a low wing propeller-driven aircraft.

Dr. Arnell: There was discussion some years ago, before we got the Trudor, about the possibility of doing *ab initio* directly into jet. It was, in fact, found with a little experience that it was better to have these few hours of propeller-driven Chipmunk before you put people on jet. This has been the policy, as far as I know, for the last few years.

Mr. Thompson (Red Deer): I am asking if there is any change in that program.

● 1155

Dr. Arnell: No, there is none at the moment.

Mr. Thompson (Red Deer): I am surprised that you have only 51 Chipmunks. Are you converting to another type of aircraft to replace the Chipmunk?

Brig. Gen. Truemner: I do not think there is any objection to that and, apparently, our 51 Chipmunks are handling our flying load.

Dr. Arnell: I would think they get quite a number of flying hours a month out of a Chipmunk, compared to a fairly sophisticated jet aircraft.

Mr. Thompson (Red Deer): You do after 20 years, too, in the same aircraft.

My second question relates to the routine maintenance of bases that are not yet assigned to the new integrated training program and are, more or less, being kept in mothballs. That is not a correct comparison, probably. I am speaking of the situation in which the training program is not up to the maximum capability of that particular base and the base is contemplated as probably being used. How much is being spent in this particular type of maintenance due to the integrated training program, as far as base allotment not yet having been completed?

Dr. Arnell: I do not think that the way you phrase this is really correct in speaking of bases that have not

been allotted. Perhaps, I can answer your question in a different way. The base structure for training, the schools, were really designed for training in toto of the order of 12,000 - plus recruits a year. Last year there was, in fact, a decrease in the total number of forces. Recruiting was cut back, with the result that last year the total number of recruits that was put through the training system was, in fact, only about 75 per cent of previous years.

At the moment, this has built back up to what is considered to be the requirement to hold a stable level. The schools are being operated at capacity. In fact, recruiting is being done on the basis of having next month's trainees already recruited well ahead of time.

Mr. Thompson (Red Deer): I am asking specifically about a situation that relates to one base, but I know that it will apply to several bases, and that is Penhold. For eight years that base has been operating at partial capability. It is being retained because of the investment and the value of the base. The officer's mess is being maintained for approximately 10 or 15 officers. The RCMP had moved in to occupy it temporarily, but they are now moving out, leaving a half vacant base. This is due, I am told, to the inability to complete base allotment, or base assignment, under the new integrated program.

Dr. Arnell: I would like to suggest in this particular case there is a little history that one must take into account.

Mr. Thompson (Red Deer): I know that history.

Dr. Arnell: Some years back, when I was Scientific Advisor to the Chief of the Air Staff, Penhold was one of our pride and joys, in terms of flying training school. Because of the commercial traffic of that day—this was before the days of jet, in the days of propellers—it was decided for reasons of safety of the commercial air that Penhold could not be kept for the type of flying training that was being done at the time.

Mr. Thompson (Red Deer): I have to differ with you there. It was not kept because of the type of training that you were going to do. That traffic did not interfere with Harvards, it interfered with Tudors.

Dr. Arnell: It came out of that. The situation with respect to Penhold is that now that the commercial pattern of flying has changed, coupled with a vast improvement in the air traffic control system, the Department of Transport no longer has any restriction on the use of Penhold for this type of thing. It is planned, once facilities and so on can be sorted out, to make use of Penhold to a much greater extent than in the past. You are seeking the costs of running Penhold?

● 1200

Mr. Thompson (Red Deer): I am not just thinking of Penhold. I am thinking of Rivers and of a number of other bases that are not operating to maximum capacity. This is due partly to integration, partly because of the indefiniteness of policy and what will be the requirements under any changes therein.

Dr. Arnell: Well, the final decisions on this are, of course, still pending with respect to the review of defence policy at the moment.

Mr. Thompson (Red Deer): Yes.

Mr. Stewart (Marquette): Could I have a supplementary, Mr. Chairman?

The Chairman: Yes, Mr. Stewart.

Mr. Stewart (Marquette): I would like to ask Dr. Arnell: when you make a decision on a base, does the Department of National Defence take into consideration whether or not it is in a designated area; whether the base is closed or relocated? Do you work in conjunction with the Department of Regional Development?

Dr. Arnell: Yes. In reviewing this whole question, during recent times—the last year or more, certainly—we have been in touch with them every time there is any consideration of this, and after it has been looked at among officials of the departments concerned, the matter, of course, then goes to Cabinet, where the overall view is looked at. In effect, the Cabinet takes all these other matters into account, but we certainly do discuss any consideration of this type with the Department of Regional Development.

Mr. Thompson (Red Deer): Mr. Chairman, I think it is very difficult to get at what I am trying to question about. You mentioned a little while ago that Lieut. General F. R. Sharp, Deputy Commander, NORAD, was going to appear as our witness next Tuesday. When he took over Western Command about three years ago, one of the objectives which he stated at that time was the decision regarding base allocation in view of the new integrated program, as far as Western Command was concerned. This situation has continued for some two years, and it is further complicated by the fact that, since we do not know what our defence policy is going to be, we do not know what our defence needs are going to be.

It seems to me that in this period of vacuum, we must have been spending literally several millions of dollars in maintaining bases because we do not know how and for what we are going to use them, if and when we formulate a policy. It is all very well to talk about, say, Penhold, having had the Harvards

withdrawn because, due to the format of the commercial air patterns, it was decided unsafe to use them for tutors or for *ab initio* jet training. But this occurred six years ago. Wastage goes on year after year. It seems to me that a fairly sizeable portion of our defence budget is being wasted simply because we do not know just where we are going or how we are going to do it when we do know.

Dr. Arnell: With respect to Penhold, we have been concentrating on the flying side of Penhold, and your assessment is quite correct on that. But the base at Penhold is also there for the radar squadron that is associated with it. In addition, a communications squadron operates out of the place. Besides, it housed the regional EMO headquarters.

• 1205

Mr. Thompson (Red Deer): ...Occupying a very minute part of the base, but nevertheless it is there. I do want to take the time of the Committee on this because I have one other series of questions I would like to ask.

In this regard, one thing disturbs me, and I mention this without asking a question, just to inform you of it. When, for example, the radar base that you refer to was built, it had to take a right of way through expropriation from a number of farms. In the agreement that was made in the expropriation of this land, the Defence Department assumed the responsibility of building and maintaining all the fences that were involved in this particular private road. It also included the maintenance of the roadway itself, along with the deterioration of the base. Due to the fact that the latter is not being used, the fences and the road have completely gone. This is the type of thing that disturbs me very much. It seem to me that in the maintenance and the equipment that is included in this vote, in a lesser way of course, the very thing that has been brought out by others relating to larger pieces of defence equipment applies; and it disturbs me, both insofar as the inefficiency and the waste of money, are concerned. Having said that, though, there is really not a question to ask, unless you would like to make a statement about it. I will be glad to bring this to your attention.

Dr. Arnell: I do not think I could make a statement on the subject, but we will certainly take note of your remarks.

Mr. Thompson (Red Deer): I will send you a memo today. Mr. Chairman, one quick series of questions. It relates to the cadet programs. I am not clear at all just what is happening under integration, either in regard to dollar allotment and expenditure or policy. As far as the Navy League, the Air Cadet League, and the Army Cadet Corps are concerned, will they be

retained as supporting structures? Is there any attempt to integrate these cadet training programs or to change them in any way?

Dr. Arnell: We discussed this at some length at the meeting of the 17 of April. You will find in Vote 5 under Grants that this year, for the first time, the Navy League of Canada is getting a grant similar to the Air Cadet League of Canada. In fact, the three programs are continuing as entities because these units are largely volunteer organizations. There is no intention at all to change this, because the department recognizes the sterling service, if you like, that these volunteers are giving to them. These men are really dedicated to seeing the cadet movement go forward. For that reason you will find two of them listed here. Moreover, as I said that night, we anticipate that the army side may find that they need help too. The navy were proud of being a completely self-financed organization until increases in costs really forced them to come and ask for help.

Mr. Thompson (Red Deer): You are standardizing your grant policies in regard to these three support organizations?

Dr. Arnell: We feel that this is why the navy is in there, at \$50,000 under Vote 5 to match the air cadets. We are prepared to recognize that they be treated as equal in all respects.

Mr. Harkness: Just a supplementary question there, if I may. How much financial support is provided for the army cadets?

Dr. Arnell: I do not think, from the point of view of a grant there is any at the moment. To my knowledge, they have never come forward and asked for any. When we considered the Navy League's request, which is now reflected in these estimates, we anticipated that the Army would find itself in need of some help someday. To date, though, the army has not indicated that, in respect of a grant, it requires assistance.

Mr. Harkness: There has been support in the past as far as uniforms and so on are concerned. Is that no longer the case?

Dr. Arnell: Yes; I think that is still in effect, but I thought you were referring to this question of Mr. Thompson to the actual grants. I think that the support itself in the material sense, as far as I know, is continuing the way it was, and would have been included in that capital that I mentioned.

Mr. Guay (St. Boniface): A Supplementary Mr. Chairman?

The Chairman: Just a minute, will you wait until Mr. Harkness has cleared up his point?

Mr. Harkness: I have not been able to find anything in the estimates any item covering support for the Army cadets. This is why I ask the question. What financial support is provided?

● 1210

Dr. Arnell: I do not believe there is any direct financial support that can be charged up to the cadets per se, because I think we have viewed the support as being essentially a grant to the organization that runs the cadets. I know that there must be some small material assistance because we do, in fact, make available to them certain facilities for summer camps and suchlike, but this, as far as I know, has never really been priced out. However, the Cadet corps, as you know, are sponsored by local boards of education with school corps, or by units of the Army, service clubs, or similar organizations which are the open corps. Each cadet corps is administered and trained by a staff of Cadet Services Association of Canada officers or of civilian instructors. The over-all training, organization and administration of the Royal Canadian Army Cadets is carried out by officers and men of the Canadian Army (Regular) at the establishment of CFHQ and at the district headquarters. I think, in large measure, this is just volunteer part time work. I might be able to get you some actual dollar values.

Mr. Harkness: Funds used to be provided for the purchase of uniforms, equipment, etc. If they are no longer provided, I do not know where the funds for this come from.

Dr. Arnell: I will have to check this, and perhaps, will have the answer this afternoon.

The Chairman: Mr. Thompson are you finished?

Mr. Thompson (Red Deer): Yes, I am finished.

The Chairman: Thank you, Mr. Harkness.

Mr. Harkness: I have a number of questions in regard to this material which you supplied to us on selected major equipment items.

The Chairman: Mr. Guay, I forgot you had a supplementary.

Mr. Guay (St. Boniface): Thank you, Mr. Chairman. Mr. Harkness spelled out the question I was going to ask. I feel that they are receiving help in grants. I was going to question that, but they are going to get the information for him. This is satisfactory to me.

Mr. Cafik: Mr. Chairman, on a point of order. For the benefit of those present, would you read the list of questioners in order so we will know where we stand?

The Chairman: There is only one other, and that is yourself, Mr. Cafik.

Mr. Cafik: I did not know whether there was a long list or not.

The Chairman: Mr. Winch is on the second round.

Mr. Winch: Second round, yes.

The Chairman: Mr. Harkness, Mr. Cafik and Mr. Winch.

Mr. Harkness: Yes. First, I have a question in connection with the first item on this list; that is, the four helicopter carrying destroyer escorts. How many of these have now been contracted for and how far along is the construction?

Dr. Arnell: I think I will ask General Davis to give you the facts of the case.

Brig. Gen. Davis: All four have been contracted for, Mr. Harkness. The first two, at Marine Industries Limited in Sorel, are presently under construction; they are manufacturing the steel sub-assembly. The second two are at Davie Shipbuilding Ltd., and they are working on the preparatory work so that they will be able to begin steel fabrication shortly. At the present time they have about 50 per cent of their steel delivered in the second yard.

Mr. Harkness: As far as the initial two are concerned, are the hulls now constructed?

Brig. Gen. Davis: They have begun construction of the sub-assemblies of the hulls. There are to be 57 sub-assemblies and they have, so far, manufactured about seven.

Mr. Harkness: What about the machinery and armament?

Brig. Gen. Davis: The machinery is well in hand at United Aircraft of Canada Limited.

Mr. Harkness: This is the engines, you mean?

Brig. Gen. Davis: Yes, the main propulsion—the gas

● 1215

chamber propulsion engines. The armament is also under construction in Italy at the Oto-Melara Company, the same firm that are building the Pack Howitzer.

Mr. Winch: You ordered some spares I hope?

Brig. Gen. Davis: I propose to deal with your question on spares later, Mr. Winch. Spares are included in the over-all program cost.

Mr. Harkness: What type of contract are these on?

Brig. Gen. Davis: I suppose you would have to describe it as a target incentive contract. I am not quite sure of what, precisely, you were seeking.

Mr. Harkness: I want to know whether or not it was on a specific cost figure.

Brig. Gen. Davis: There is a ceiling cost, but I think, Mr. Chairman and Dr. Arnell, it would be better if DDP were to comment on this.

Dr. Arnell: We would have to get the direct information, I think, from Defence Services.

Mr. Harkness: What is the estimated cost, now, of these four destroyers? Is it \$220 million?

Brig. Gen. Davis: This is so.

Mr. Harkness: However, there is no firm contract that this will be the final cost. That is a cost of \$55 million apiece for these ships.

Brig. Gen. Davis: That is the total program cost, yes.

Mr. Harkness: It works out to approximately \$55 million a piece for these ships.

Brig. Gen. Davis: Yes, it does, for each of them.

Mr. Harkness: We have no assurance that that will be the final figure though. This is a rough estimate, is it?

Brig. Gen. Davis: No. I do not think you can say that it is a rough estimate. It is the present estimate which is one of a series, each one coming closer to the actual fact. I think one would be rash to say, though, that is the absolute final cost.

Dr. Arnell: I think there is another point here, Mr. Harkness, which I must add. When you look at the history of some programs of this magnitude, stretched over this period of time, often you have a union decision, or at least, a union settlement, which, in fact, gives you a great increase in labour costs. None of these contracts that extend over five or six years are, in fact, completely ironclad with respect to your labour costs. You have to be prepared to increase the contract to take care of labour costs, at least. This, in fact, is something of which, I am afraid, I cannot give you the total story, because this is handled for us by DDP.

Mr. Harkness: That was my next question. What percentage of this total sum has been put down for escalation of costs? On the basis of the history of the past 20 years, at the time the cost estimates were made, everybody knew that labour and other costs were going to go up. Therefore, a figure was inserted in each case to take care of this escalation. What percentage of this figure is to cover escalation?

Brig. Gen. Davis: I think DDP would have to be asked to come and deal with the contract in detail.

Mr. Harkness: We will leave that at the moment. The next item concerns the operational support ships. Where are they being constructed and how far along is that program?

Brig. Gen. Davis: These are being constructed in Saint John.

Mr. Harkness: Both of them?

Brig. Gen. Davis: Both in the same yard. The first one is due to be delivered at the end of July of this year, the second one probably in January of next year. So, the first one is well along towards completion.

Mr. Harkness: Is it anticipated that this figure of \$63 million is a firm figure as far as the cost of those two ships is concerned?

Brig. Gen. Davis: Yes, indeed it is. There may be a relatively small increase in cost in the Sea Sparrow

● 1220

Missile System with which these ships, and the DDH's are being fitted. This is the only increase that we are expecting at the moment, and as I say, the program is running on to its conclusion.

Mr. Harkness: As far as the *Restigouche* conversion program is concerned, in what yards is it being carried out and how far along is that?

Brig. Gen. Davis: So far, the only vessel which has been converted is HMCS *Terra Nova*, which was done in the dockyard in Halifax. It was done, essentially, as a prototype so that DDP would have a better basis for the costs of the remainder of the class. There are three more to be converted, two of them will be put out to competition across the country. The third we expect, will go to the West Coast.

An hon. Member: Is that the *Chaudiere*?

Brig. Gen. Davis: Yes, I believe it is. However, we do not yet know how this program will fare in the current review, and particularly, we do not know which yards will be involved.

Mr. Harkness: Is the one ship completed? Is it true, then, that the cost of it was this \$10,296,000?

Brig. Gen. Davis: It is not easy to say that, Mr. Harkness. This program cost includes all the equipment that is being required and indeed, the equipment costs for the conversion are the larger proportion of the total cost. A good deal of the money that has been spent so far, has been for equipment for the class.

Mr. Harkness: One ship has been completed, and the amount that has been spent to date is this \$10 million?

Brig. Gen. Davis: Yes. This \$10 million is nearly a quarter of the cost.

Mr. Harkness: Well, it is about a fifth.

Brig. Gen. Davis: About a fifth, yes.

Mr. Harkness: This is the reason I wondered why these other three ships apparently were going to cost considerably more than the one already completed, particularly as the \$10 million includes some equipment which will be used in the other ships.

Dr. Arnell: I think it is a question of labour costs.

Brig. Gen. Davis: The original concept of the program was for more ships in order that we would have more equipment.

Mr. Harkness: The point I am getting at is this. You have completed one ship. You have secured some of the equipment for the other ships.

Brig. Gen. Davis: It is in the process of being secured.

Mr. Harkness: You have spent 10 million. Your estimate for the four ships is \$49 million which is nearly five times as much; apparently, you are estimating for these other three to cost very considerably more than the one which is completed.

Brig. Gen. Davis: Well, certainly. The one that is done, was completed in the dockyard at a much lower cost than we will have to pay for those vessels which are being built in private yards. What we wanted in the case of the ship being done in the dockyards, was a firmer idea of the man hours involved in the conversion, so that DDP would be able to assess better the prices they will obtain from the yard.

Mr. Harkness: You have not then, in this figure, allocated to the cost of this conversion the labour costs of the dockyard work?

Brig. Gen. Davis: Yes, we have. However, we do not pay overhead in the dockyard. The overhead costs, the costs of running the yards in question, for which a private yard would have to charge along with its profit, will not be included when we carry out the refit for the conversion in the dockyard, as when the first ship was done.

Mr. Harkness: Why, then, would you not do all of these conversions in the two dockyards we have, at Esquimalt and Halifax, at a very considerable saving of money?

Brig. Gen. Davis: I think I will ask Dr. Arnell to answer that.

Dr. Arnell: I would have to say, Mr. Harkness, that this type of decision is not entirely one for departmental officials.

Mr. Harkness: Well, I realize that, but I thought you would be able to give us the reasons for what is proposed, rather than construction in the dockyards.

Mr. Winch: It will be a good question when we have the Minister before us next week.

Dr. Arnell: I think that my possible statement of the reasons might be the same as those for which you are probing for the answers.

● 1225

Mr. Harkness: I do not understand what you mean. However, would you prefer not to answer that question?

Dr. Arnell: I really do not think I can.

Mr. Harkness: In regard to the Oberon submarines, I see that most of the estimated total has been expended. What is the situation as far as those three vessels are concerned?

Dr. Arnell: They are all in service. The amount of money that is needed in 1969-70 and in the subsequent year, will be essentially to buy spares.

Brig. Gen. Davis: The over-all program for Oberon submarines when it was set up, included a very considerable amount for spares and the money that will be needed in 1969-70 is to deal with the final acquisition of those spares, which takes a considerable time to arrive from the Admiralty.

Mr. Winch: That does not negate my question at all.

Mr. Harkness: The figures as far as the Oberons are concerned, are firm and essentially complete?

Brig. Gen. Davis: Since I personally negotiated this contract, I thought you would say that this was one of the very few we have had, which has been on time and for the price that we were supposed to pay.

Mr. Winch: Do those figures include the Oberon which is under refit now in Halifax?

Brig. Gen. Davis: Certainly not. Refit parts were not part of the initial procurement program.

Mr. Harkness: As I personally authorized this program, I am very happy to find that this is the situation!

An hon. Member: Very good.

Mr. Harkness: What is this naval research ship, and what is its situation?

Brig. Gen. Davis: It is a vessel being built for the Defence Research Board; it is to operate on the East Coast and is somewhat similar to the *Endeavour* which has now been in service on the West Coast for some time. It is, however, a good deal more advanced than the *Endeavour* in that it is to be used for antisubmarine research, and is being built to an extremely low noise level; this noise level has probably not been achieved before in ships in the western world. It is nearly complete, but there are some delays being experienced and we do not expect trials to begin until the summer. It is really one of the more advanced vessels with which we have been involved. Do you wish to add any information, Dr. Arnell?

Dr. Arnell: I think that is all.

Mr. Harkness: Does that ship carry any armaments?

Brig. Gen. Davis: No.

Mr. Harkness: None at all.

Brig. Gen. Davis: It will probably at some time, have experimental antisubmarine sonar equipment. You might perhaps regard that as a weapon, but they do not have guns or weapons of that sort.

Mr. Harkness: There are not any depth charges or anything else?

Brig. Gen. Davis: No. It might have explosives on board which will be of use in their sound, but they will not kill anybody, except inadvertently.

Mr. Harkness: On page 3, concerning the armoured personnel carrier, is that program complete?

Dr. Arnell: Yes, sir.

Brig. Gen. Davis: Essentially.

Mr. Harkness: How many armoured personnel carriers have we now?

Brig. Gen. Davis: We bought 461 in the first buy, and 500 in the second.

Mr. Harkness: How have these stood up to use?

Brig. Gen. Davis: There was a major fault in the fuel tank. Speaking as a naval constructor, I have to advise that they were not designed by naval constructors; had they been, this fault would not have occurred; the fuel tanks were connected directly to the hull and became rapidly susceptible to fatigue and fracture. It was a serious complaint since the APC became full of fuel rather than people; we have had to replace all of these tanks. They are replaced with a separate tank which does not have this fault. This was the major fault that we have had; we have tended to use ours more severely, I think, than the other nations, so that it came to a head with us rather quickly.

● 1230

Mr. Harkness: What was the cost of this repair program?

Brig. Gen. Davis: I do not think I could tell you that, but I could find out.

Mr. Harkness: Have there been any difficulties as far as trackage is concerned?

Brig. Gen. Davis: Not that I know of. This really has been the only complaint we have had.

Mr. Harkness: What is the situation as far as spare tracks are concerned?

Brig. Gen. Davis: I could not tell you. Do you mean how many?

Mr. Harkness: Yes. I found from personal experience in tanks and track vehicles that one of the major difficulties that we always ran into was breaking of trackage, replacement of trackage, and so forth.

Brig. Gen. Davis: We can establish that for you.

Mr. Harkness: Concerning these 155 millimeter self-propelled howitzers, how many of them have we secured?

Brig. Gen. Davis: Fifty.

Mr. Harkness: How many of those 50 are in actual use, and how many are kept as spares?

Brig. Gen. Davis: I could not tell you that.

Mr. Harkness: How many regiments are equipped with them?

Brig. Gen. Davis: They were to equip the artillery regiments.

Colonel C. L. Kirby: The regiment in Germany is equipped with that, but I do not know what the equipment is in Canada.

Mr. Harkness: Well, that would be 24 guns; as far as the regiment in Germany is concerned, apparently the idea was to have equipment for two regiments.

Mr. Harkness: Is there any program to secure more spare guns? They are not only guns, but in this case, they are complete pieces of equipment.

Dr. Arnell: As I said earlier, Mr. Harkness, this year's budget is a strictly hold-the-line one and there is no new program in it at all. The final decisions are pending, and then we hope that we will, in fact, embark on a new equipment program in which this type of thing will be considered.

Mr. Harkness: What use is being made of the other half of them, the twenty-four? I imagine at least one spare is with the regiment in Germany. Where is the other half? How are they being used? Who is equipped with them?

Dr. Arnell: It is Shilo, is it? We can find out for sure, but I am certain it is to train them.

● 1235

Mr. Harkness: How much firing per year does this ammunition estimate provide for? I am talking about, practice firing, of course.

Brig. Gen. Davis: You are asking about the number of rounds per year and that sort of thing?

Dr. Arnell: This, of course, is the stockpile of ammunition rather than the actual number that will be fired in the year. With all new procurements they always build up to the level of war stocks.

Mr. Harkness: I was somewhat concerned that the balance to be paid in future years will be \$1 million. This would not provide for very much practice firing, which is an essential.

Brig. Gen. Davis: One would say here, Dr. Arnell, that we are procuring ammunition every year. This is a complete buy, but almost certainly, in future years, there will be further buys of whatever kinds of

ammunition are required. We are spending approximately \$25 million to \$30 million on ammunition, so this is not necessarily the end on the M109.

Mr. Harkness: No, but as far as artillery ammunition is concerned, you do not make an initial buy and then just keep it in stock indefinitely. You have to keep on using it and replacing it because if you leave it over a certain length of time, it deteriorates and is no longer dependable.

Dr. Arnell: I think the point, sir, which General Davis was trying to make is that this reflects the initial order that was placed along with the guns themselves. It includes both provision for training as well as whatever stockpile was built up. The question of the re-supply for training purposes would not, in fact, appear in this list at the moment. I would judge from this that the decision for the next buy has not, in fact, been made yet.

Mr. Harkness: In other words, your assumption is that there is no provision in this concerning the amounts required for practice firing?

Dr. Arnell: There is about \$30 million in this year's estimates for various types of ammunition and bombs which is a straight replacement for training. I do not have this broken down for you.

Mr. Harkness: We will leave that at the moment. What type of gun is this 105 mm pack howitzer, could you give us a brief description of it?

Dr. Arnell: Could you come forward, Colonel Kirby?

Colonel Kirby: I am not a gunner, but the 105 mm is a gun that can be broken down into 12 loads. I think this was described the other day in public as 12 mule loads, but I do not think we intend to use mules. It makes it very efficient, however, in breaking down into small vehicle loads, into helicopter loads, and that kind of thing. It does use a standard 105 mm field gun ammunition with a range reduction. It is usable in a low-silhouette anti-tank role or in a high-silhouette howitzer role. It is a very versatile weapon, in other words.

Mr. Harkness: How many of these guns have we secured?

Colonel Kirby: Twenty-eight.

Mr. Harkness: 28. So, this is essentially the equipment for two batteries?

Colonel Kirby: Yes, sir, although again I am not quite sure of the distribution—in what batteries they are in or in what formations they are located. I can find that out for you for this afternoon.

Mr. Harkness: Possibly, with a light gun like this, they are probably located in three batteries. You do not know the details on that?

Colonel Kirby: I can get the details of the distribution of them very easily.

Mr. Harkness: Yes. I would like a little more elaboration on just what this equipment is, what its range is, and what the organization of the batteries will be. It is

● 1240

probably a light regiment, I do now know. This is the information I would like.

Colonel Kirby: I think at the moment they are broken down in batteries, not in one regiment.

Mr. Harkness: Independent batteries?

Colonel Kirby: Yes, sir.

Dr. Arnell: Mr. Harkness, if I could go back for a moment. The distribution of the 155 mm howitzer is this: there are 12 with Mobile Command, 26 overseas, 11 with Training Command, and one held back in reserve.

Mr. Harkness: I will let someone else do some of the questioning.

Mr. Cafik: Dr. Arnell, I noticed in looking at the revised form of estimates and taking some details from there that you have broken down the details of construction and acquisition into certain categories, such as NATO, the Joint Defence of North America, etc. I will give you one of the figures for an example concerning the total capital cost, or estimated cost, of the Hydrofoil. I notice that 75 per cent of that cost is allocated to NATO, and 25 per cent of the cost is allocated to the Joint Defence of North America. Does this mean that the value you put on the Maritime services is allocated in that kind of proportion?

Dr. Arnell: No, Mr. Cafik. As is expressed in the notes that come with this which are included in this new form of estimates, and which was the point that I was trying to make the first night when talking about this, this new form of estimates is, in many areas, a straight pro-rated thing this year because we simply have not built from basics. As is stated on page 23, which discusses the explanation of the various programs, the Maritime forces do, in fact, meet our responsibilities under NATO, under Joint Defence with the U.S., and also certain purely Canadian responsibilities.

For the first time around, because we simply did not have any other way of doing this, and because of the nature of putting this together, we assigned, as is

stated here, the East Coast Maritime forces to NATO, because this has been said many times by the Prime Minister and others as being one of his prime tasks. On the other hand the West Coast forces are assigned in this breakdown to the Joint Defence of North America, because the West Coast forces operate under the joint Canada-U.S. Regional Planning Group.

As the explanation brings out, it is not really a 100 per cent assignment. For purposes of this display, we had to just pro-rate at the moment. When you look at the forces it breaks down to about three to one. The Hydrofoil is, in essence, a developmental vessel. We cannot predict just where it is going to be used. We presume that it will go in the same general proportions as the Maritime forces themselves. It is as simple as that, right or wrong.

Mr. Cafik: Dr. Arnell, then one could draw the conclusion that at least at the time that you were preparing this new form of estimates in this particular area, that you yourself felt that 75 per cent of Maritime forces, at this moment anyway, would be accurately ascribed to NATO?

Dr. Arnell: We made it on the basis that for this year, three-quarters of the Maritime forces would be on the East Coast. That is really what we have assumed.

Mr. Cafik: All right. However, I bring to your attention as well, the question of the Hydrofoil which is confined to the East Coast at the present moment; I do not suppose you are going to use and transport it, contributing a quarter of it in the Pacific. Therefore, I presume that in that particular example you must have

● 1245

drawn some kind of a conclusion, whereby you felt that roughly three-quarters of this type of force was assigned to NATO.

Dr. Arnell: It would be on the East Coast.

Mr. Cafik: Yes, but surely three-quarters of the Hydrofoil was not going to be on the East Coast?

Dr. Arnell: No, not the Hydrofoil itself.

Mr. Cafik: Then did you mean three-quarters of the ones that are to be built?

Dr. Arnell: After all, it is development; you never use the developmental vehicle operationally.

Mr. Cafik: Okay, I understand.

Dr. Arnell: But if the development of the Hydrofoil leads to Hydrofoil vessels in any number above four,

we would expect to have at least one on the West Coast, if we were to have them on the East Coast.

Mr. Cafik: I pursue this point a little bit further because I think it is relatively important in judging our military posture. In other areas such as improvement to communications, which is sort of a general thing that I am sure would apply to East and West Coast, do you find the same break-out? That would be roughly three to one. Again, I say that I do not expect that this is a development project.

Dr. Arnell: This is improvement of communications to the ships themselves. If we have a quarter of the ships on the West Coast, any improvement is on all the ships. As I say in the text here, because we had to prorate in some way, next year we must be much more precise in this. This is only one way of trying to give you more information, about some of which we have to be arbitrary; as the text states, we took the decision that we would put all the East Coast Maritime forces under NATO but they do have responsibilities to joint North American and others. Therefore, whatever we do to those three-quarters of the ships, will appear as 75 per cent supporting NATO. We could have been completely arbitrary and said we did not have any of them for NATO; we could have put it all in joint defence in North America. Of course, they have responsibilities for NATO.

Mr. Cafik: If you were now to make a more accurate judgment on this, not based upon these figures, what would you think is the appropriate proportion of cost to be assigned to NATO?

Dr. Arnell: I am hoping that the exercise that is going on at the moment and which is beyond my control, will tell me what I should do.

Mr. Cafik: Yes, but I am talking about our existing policy; perhaps you would rather not answer that, I do not want to embarrass you.

Dr. Arnell: No, it is really a discussion point rather than a point of substance. The Maritime Commander develops the bulk of his operational strategy in consultation with the Americans at SACLANT. Because he does that, he is really developing, primarily, NATO strategy. One of the real difficulties is that when we speak of the joint defence of North America there is also within NATO, the regional defence area; therefore the joint defence of North America, if you want to be terribly legalistic, is supporting NATO in any case. Whether we speak of joint defence or regional defence of North America, you could in fact, put it all under NATO. However, we decided, particularly because the air defence side is one that I think most Canadians recognize as being truly a defence of North America, whether there is a NATO or not, that we did not want

to put it all under NATO and say everything done in North America relates to it, so that we made the distinction. I can assure you that this Maritime case caused me more trouble than everything else that is in the book. The obvious answer in dealing with it would have been to make a separate activity, which would operate Maritime forces; this would have solved the question as far as you people are concerned today; it would not, in fact, have answered the program question, however, because the only reason for having that

● 1250

activity was to operate Maritime forces; you would have asked why, and then I would have had to go back and deal with it another way.

Mr. Cafik: I can appreciate, Doctor, your dilemma here. Mr. Harkness brought up the question of ammunition and bombs. I had intended to do the same thing. I notice in the column of "total estimated costs of projects," that when you add up all the ammunition and bomb totals, you end up with roughly \$112 million, of which \$33 million roughly is for this year's expenditure. It says "total"; is this a specific contractual order for ammunition or how far back does it go? Obviously it does not go back to the Boer War; it must start somewhere.

Dr. Arnell: This is a compilation of what is essentially the five-year re-equipment program that was initiated in 1964; procurement began really starting in 1965. Included in this is a very wide range of things. It is not just shells for guns. There are the Mk. 46 torpedoes; there are aircraft bombs, there are air to air missiles. Everything is grouped here. In terms of ammunition, some of the major items are included in the selected major items which I tabled April 17. In fact, Mr. Harkness was asking specifically about a couple of those ammunition programs. The 155 mm howitzer order that cost \$15.7 million was the ammunition order that went for that particular one. It is part of that \$112 million or whatever you suggested.

The \$2.1 million that is shown in this year's cash phasing for the 155 mm howitzer is part of the \$31 million that you obtain for the total.

Mr. Cafik: Dr. Arnell, the obvious question—as far as I am concerned—is if defence policy and position were to remain the same, does this mean in effect that we can look forward to expenditures in the neighbourhood of \$20 to \$30 million per year for ammunition and bombs?

Dr. Arnell: I believe that this will be approximately the level that you can expect to look forward to for years. This is typical of the cost of ammunition. Ammunition is terribly expensive.

Mr. Cafik: I think anyone can see that.

Dr. Arnell: I think that you were given a reflection of the cost when Mr. Harkness told us that he did not think that we had enough money in the estimates for the 155 mm ammunition. I am not sure of the cost of a single shell of that.

Mr. Harkness: Just a correction. I did not say that. My intended question was: What amount was in for practice purposes? I do not know whether you have enough, or whether you have too much.

Mr. Cafik: Are ammunition and bombs used for training purposes on an annual basis?

Dr. Arnell: There are two points. The first is that you buy for training; the second, that ammunition has a limited life. You were referred to the latter point earlier.

The standard policy attempts to equate the war stocks—which are arrived at by a fixed formula as to the amount required for certain types—with the shelf life and the training needs. Hopefully, as ammunition reaches the end of its service life it may still be used for training. Obviously, this cannot be balanced perfectly. One's annual buy reflects new war stocks or perhaps new equipment, all the annual training, and replacement ammunition. If you managed to work out the formula, the training and replacement will become the same. In fact, it may not. One of the difficulties that technical people who are concerned with the ammunition encounter, is to maintain safe ammunition, by using it sensibly without having to destroy too much when it becomes unsafe. This is the best answer I can give you.

Mr. Cafik: There is one supplementary. I cannot remember the gentleman's name, but he was discussing

• 1255

armoured carriers and fuel tanks being put in the wrong positions. This caused some degree of difficulty in the Department. Now you said that if you had the responsibility, this situation would not have occurred. The obvious question is, Why did you not have the responsibility, if you had the knowledge?

Brig. Gen. Davis: These vehicles were procured to an American design and essentially from American production lines, so that, from an economical point of view we were not able to introduce considerable changes into the design at that time. As the operation of the vehicles began, it became clear—as it had not been clear before—that these tanks resonated and vibrated to a great degree. Hence, very quickly they failed.

This is a problem which is bound to occur when one is joined to another's production line.

Dr. Arnell: It is much broader than that. This is the same problem that you see every week or two in the newspapers now, where automobile manufacturers withdraw automobiles that have faulty parts.

Mr. Cafik: Yes, but they pay for it.

Dr. Arnell: Perhaps to lighten the thing a little, I might say that the Navy always built very heavily since they had to withstand very large seas compared to bumps in the roads. When I heard General Davis make his remark earlier that—if he had designed it, he would have done it differently—I passed the quip that it would probably have weighed half a ton more.

Mr. Winch: Why do you not test this kind of equipment on Ottawa roads?

Dr. Arnell: If I might change the subject a little. While General Davis has been at the table, he has handed three of the answers to the earlier questions to me. I thought that if he provided them, he might like to comment on your Fresnel lens.

Brig. Gen. Davis: First of all, I would like to say that I do not want to comment on the *Bonaventure* Tracker situation at the moment. From the experience of my colleagues, I do not want to discuss the *Bonaventure* until I know what I am talking about.

Mr. Cafik: I think that we feel the same way. Yes, learn, as you say.

Brig. Gen. Davis: The 105 pack howitzer was bought from Italy and will be coming into service at the beginning of this year. There was a small kit of spares with the guns. We were a little late ordering the bulk spares, but they are now being delivered. We also pressed for the guns to be delivered quickly, so that they could get into the training role, as soon as possible. I think that the pack Howitzer situation should now improve quite markedly.

Mr. Harkness: While you are still discussing the pack howitzer. Is the ammunition purchased from Italy or is there any other source of supply?

Colonel Kirby: Yes, it uses the standard charge and as I say the only difference is that there is a slight range in which they cannot use the higher charges in the ammunition.

Mr. Harkness: We can manufacture the ammunition ourselves in Canada for this?

Colonel Kirby: I am not sure whether the standard 105 pack howitzer ammunition is manufactured in Canada. I think it is, but I am not sure.

Mr. Harkness: It used to be manufactured so I presume . . .

Colonel Kirby: It is the standard ammunition made.

Brig. Gen. Davis: The 155 mm Howitzer spares were ordered with the gun. However, as is not unusual, there were subsequent design changes made on the gun. Due to these changes, the spares that were initially provided could not be used. It is a U.S. responsibility to change the spares, and they are now rectifying

● 1300

the situation. We are told that the majority of the correct spares have been delivered.

Mr. Winch: That is only in the last month.

Brig. Gen. Davis: Yes.

Mr. Winch: In the previous months you did not have spares, traps or barrels.

Brig. Gen. Davis: It was largely due to American problems. The Fresnel lens situation is another of the same character. We were able to obtain the Fresnel landing system only with great difficulty.

Mr. Winch: You received it through the U.S. Navy.

Brig. Gen. Davis: We did indeed, but it was not easy. We ordered the spares at the same time we procured the equipment, and they have not yet been delivered.

Mr. Winch: I am sorry, sir, I want to get this straight. You ordered at the same time.

Mr. Davis: Yes.

Mr. Winch: That Fresnel system has been on there now for over two years, almost three.

Brig. Gen. Davis: Yes. We are pressing, naturally, for the delivery of these spares. We are optimistic that we are going to get them shortly.

Mr. Winch: Two and a half years late.

Brig. Gen. Davis: Mr. Winch, we are dealing with an armaments industry that has greater problems than ours. They have a war on their hands. This problem may well be characteristic of both the howitzer and the Fresnel lens. It is not, in any event, for want of trying on our part.

Mr. Guay (St. Boniface): May I ask a question? You also told us that there had been some changes made in these parts.

Brig. Gen. Davis: Yes, with the 155 mm howitzer.

Mr. Guay (St. Boniface): Right.

Mr. Winch: There is no change on the Fresnel to my knowledge.

Brig. Gen. Davis: I was speaking of the Howitzer only when I spoke of changes to the gun which caused the spares not to be accepted. That was the only one.

Dr. Arnell: I think, in fact, the type of change that he is referring to could perhaps be illustrated by the story of the gas tank on the armoured personnel carrier. After all, if you bought it with the tank in a certain place, you could probably have bought some spares and replacements. If you had to change the tank you are, in fact, going to be in a different spares category. You do, in fact, find in all these equipments some modifications for operation.

Mr. Winch: Dr. Arnell, what is the position of our brigade in Europe which is completely equipped with 14, is it not, Mr. Harkness, of the 155? Are they in this position now, because of changes, of not having spares?

Mr. Harkness: They have 24.

Mr. Winch: Yes, 24.

Brig. Gen. Davis: They were, yes, except that each has a small case of spares. The bulk spares are now being delivered. We are advised here that they will very shortly have all of these delivered.

Dr. Arnell: I think I should interject at this point to say that it is 1:05 p.m., and we should adjourn now until 3:30 p.m., unless there are only one or two questions on this point.

An hon. Member: I want to ask some questions on the second round.

The Vice-Chairman: We will adjourn and we will have a further opportunity to ask questions. General Davis, if you will be here at 3:30 p.m. there may be further questions that you can answer.

(Afternoon Sitting)

Thursday, May 1, 1969.

● 1533

The Chairman: Gentlemen, I think we are ready to begin. Mr. Winch?

Mr. Winch: Mr. Chairman, I have discussed this with you and Dr. Arnell a moment ago because I would like

to assist in expediting our business on Defence estimates. May I, under the Vote we are now under, put three questions together? If I do so, it will make a better presentation and Dr. Arnell and his staff will have a chance to get the answers. Is that all right, Mr. Chairman?

The Chairman: Yes.

Mr. Winch: First, when I am finished, Dr. Arnell, will you please comment on the estimate for 1969-70, which is on page 242 of the Blue Book, of \$64,497,000 for Professional and Special Services. I ask, Dr. Arnell, for your comment on this, in view of the fact that of 98,300 in our armed services, 106 are Brigadier-Generals or higher, and on our military staff at NDHQ, which amounts to 3100, 1800 are commissioned officers?

● 1535

Second, Mr. Chairman, concerns the same page. It deals with Rentals. Under Rentals we note for 1969-70 the amount of \$11,545,000. I would like to ask, Dr. Arnell, if it is not a fact that for the past three years, approximately, there has been on the drawing board the building of a multi-multi million dollar defence headquarters? If so, why this amount? In particular, will you please advise this Committee if it is correct that the Defence Department has signed contracts amounting to millions of dollars, and running from 10 to 40 years, with the owners or operators of office buildings?

If I am correct that there is, and has been on the drawing board, this \$100 million NDHQ building, on what basis do we have this amount of money for Rentals? Have contracts been signed by the Defence Department with private operators running from between 10 and 40 years?

On Rentals, but not dealing with that phase, there is a matter, Mr. Chairman, which you know is of considerable interest to members of this Committee who made a trip overseas. I would like to ask, and I know members of this Committee are interested in asking, on what is based the policy of the Department of National Defence, that coincidental with increase in wages to our armed forces, you increase rental charges to those who are subject to same as members of the armed forces? May I also ask on what basis do you establish a policy that increased rentals to our members overseas is related to increased rentals to the civilian population in Ottawa?

Third, on the same subject, because this was most certainly drawn to our attention on our visit a few weeks ago, on what basis, by policy, did you increase the rentals to our armed forces at Lahr, which went into effect on April 1, when we as a committee were informed by General Lane that your Department does

not pay rent for our establishment at Lahr, you only pay taxes?

Will you further explain how and why, that coincidental with increased wages to our armed forces and increased rentals—and we were told this at Lahr and Zweibrücken—a number of our armed forces were subject to increased rent which exceeded the increased salary, so the take home pay was less. Would you please, sir, explain?

Dr. Arnell: Yes, Mr. Winch, I will do my best.

● 1540

First of all, with respect to your first question on the Professional and Special Services. . .

Mr. Winch: \$64,497,000.

Dr. Arnell: Within this amount of money we provide for expert advice on legal services, engineering services, training and educational services, health and welfare services, professional services, and others. Among the specific items that are covered within this are: tuition costs for service personnel who are sent away for either graduate work or to special courses, non-resident school fees for the children of military personnel when they have an overseas posting. . .

Mr. Winch: I am sorry. Do I understand that included in this is all the cost of the teachers overseas?

Dr. Arnell: No, these are the non-resident school fees. Every so often we post service personnel to a place where they cannot get adequate education for their children. It is necessary, in effect, to assist those particular families by allowing their children to go to school somewhere away from home.

Mr. Winch: I am sorry. Then perhaps, sir, if I may, because I do not want to hold it up . . .

Dr. Arnell: This goes on . . .

Mr. Winch: Could you give us a breakdown as to the moneys spent on the meaning of Professional and Special Services.

Dr. Arnell: The actual description is the following: it pays for the Corps of Commissionaires; the school teachers for all the children's schools come out of this; within this are some of the overseas capitation payments which are the moneys that we pay to the British for assistance which we get from them overseas; and also are included the overseas indigenous labour that is, the Germans that are hired to go through it. Within these you get changes and so on, but I think the main point would be the school teachers' salaries, overseas indigenous labour that support our bases, as well as

such professional fees as we need to pay to get legal advice, engineering advice and so on. This covers all the professional consultant advice and in fact, special services.

Mr. Winch: Could I just ask two questions on that phase, Mr. Chairman? Can you give us the figures of how much you pay civilian personnel overseas, who are as you said, German?

Dr. Arnell: The overseas indigenous labour, Mr. Winch, is \$3.9 million.

Mr. Winch: \$3.9. I will check it formally.

Dr. Arnell: I might add that the capitation payments that are associated with the Brigade Group amount to \$13 million.

Mr. Winch: That is the German civilian employees?

Dr. Arnell: This is paid to the British for the support we get for the Brigade Group from them.

Mr. Winch: Would you please explain that? You pay \$13 million for what purpose?

Dr. Arnell: It is basically the food we draw through the British supply line.

Mr. Winch: Before you go on to the second point, may I ask, in view of the fact that you have a highly integrated legal section in National Defence Headquarters, why you said this includes money for legal advice, and how much is it?

Dr. Arnell: I am just looking to see how much it is.

● 1545

Mr. Winch: Well you included this, sir, so you got away from the question.

Dr. Arnell: The legal fees that are provided here are \$50,000 and they relate for the most part to civilian court costs and other miscellaneous services. Often we have to pay for a court stenographer or something like that, and that would come into the legal fees.

Mr. Winch: That is only \$50,000.

Dr. Arnell: I might point out that one of the other big items, the salary for school teachers includes \$15.5 million of this.

Mr. Winch: You are still short about \$30 million.

Dr. Arnell: Yes and I have about four pages left.

Mr. Winch: What kind of services does that cover?

Dr. Arnell: The Corps of Commissionaires is \$8.5 million.

Mr. Winch: At \$8.5 million, what is the Corps of Commissionaires doing?

Dr. Arnell: You will find them as night watchmen on various armouries and so on; they are present at the gates of most of our bases; you will discover that we use the Corps of Commissionaires in a very large measure for our guards; you see them operating at Uplands for example. In fact, you find them all around the parking areas and generally around National Defence Headquarters, and on the front door there, also.

Mr. Winch: Do you pay the Corps of Commissionaires?

Dr. Arnell: We pay them. We enter into a contract with them for services.

Mr. Winch: With the Corps of Commissionaires?

Dr. Arnell: Yes.

Mr. Winch: You pay the Corps of Commissionaires as a whole, not the individual man?

Dr. Arnell: We buy their services just as anyone else does so. They undertake to provide a certain service for us at a standard fee.

Mr. Winch: Do you insist that they live up to the regulations and the law of the Federal Government on holidays and so on?

Dr. Arnell: I would have to check exactly what the contract is. I have always understood that we buy the same service from the Corps as does everybody else.

Mr. Winch: You do not ask the headquarters of the Corps of Commissionaires with whom you contract that they must live up to the status of holidays with pay, holidays off and overtime?

Dr. Arnell: I would have to have somebody check the contract. I simply do not know.

Mr. Winch: Would you mind doing that for me?

Now then, sir, would you mind if I go over this rental business, especially on contracts? First, do you have contracts going over many years?

Dr. Arnell: Yes, there are some, where for married quarters on base we have entered into contracts of

various duration, where rather than building our own married quarters we have in fact made a contract with an entrepreneur. I do not have the actual detail of the various. . .

Mr. Winch: I am sorry sir. I am interested in what contracts you have made in Ottawa.

Dr. Arnell: We do not; Public works make our contracts for us here.

Mr. Winch: Under your information?

Dr. Arnell: No, Public Works provides us with space in Ottawa.

Mr. Winch: But you tell them what you want?

Dr. Arnell: We will say that we need so much space. The question of the new building is again within the over-all government building program; Public Works will be involved in that in exactly the same way as any other building. We are involved in the design of the building, but the actual question of the timing of the building and so on, is in the hands of Public Works.

Mr. Winch: Then has your Department over the past few years asked for certain accommodation under a long term contractual agreement? Public Works, I presume, would not make this available or sign contracts, except upon your own request for supplying this space. Have you and the Department put in a request to Public Works for certain space, available and contracted for, over a long period of years?

● 1550

Dr. Arnell: It has always been my understanding that we merely ask Public Works to get us space; we outline what we need.

Mr. Winch: Do you also outline the length of time for which you will need it?

Dr. Arnell: In any cases to which I have heard reference it has been predicated that we will need the space until the time we have our building.

Mr. Winch: I am sorry, Mr. Chairman, but I am afraid Dr. Arnell . . .

Dr. Arnell: But the timing of the construction of the building, Mr. Winch, is not in the hands of the Department of National Defence.

Mr. Winch: Do you make the request to the Department of Public Works?

Dr. Arnell: Only for space.

Mr. Winch: You do not put down at any time for how long you think you may require it?

Dr. Arnell: We can say how long we think we will require it, but the length of time for which we will require it is up until our building is completed.

Mr. Winch: In other words . . .

Dr. Arnell: The timing of the building is not a matter of our own choice.

Mr. Winch: Oh I understand now: you put in a request, but it is entirely up to the Department of Public Works if they sign contractual agreements.

Dr. Arnell: As I understand it, yes.

Mr. Winch: It is not your responsibility?

Dr. Arnell: They do all the contracting for space.

Mr. Winch: If they have signed contracts in private buildings for years on end, that is their responsibility and not yours?

Dr. Arnell: As I understand it, yes.

Mr. Winch: Thank you. Now will you please deal with this matter of rental charge?

Dr. Arnell: I want to make one other point, Mr. Winch, on this question of rentals. Included in these rentals are those of computers and in face, data processing as well. This is rentals in the total sense of renting something; within this total there is something better than \$2 million, out of this, related to data processing equipment not to accommodation.

Mr. Winch: Now, I may say just one thing. I want you to know, Dr. Arnell, that what you are saying now about this rental charge to our people will be noted overseas by our armed forces. I just want to say that! I have seen letters to the editor in their papers and they were raising hell!

Dr. Arnell: The whole question concerning the rentals of PMQs goes back to the fall of 1966 when the changeover of the method of military pay was converted from pay and allowances—with allowances graded by rank—to that of salaries aimed at being equivalent to that in civilian life in terms of equivalents for trades, and so on. One of the things that was part of the changeover was that PMQs would be put on—I am trying to think of the right adjective for this—a rental that was, if not equivalent, at least could be compared with rents with respect to the location. Prior to the fall of 1966, the question of whether a member of the military service drew any

allowance to assist him with rent or not, was directly, related to whether he was given permanent married quarters or not. In other words, he got it free, but the man who did not get a PMQ received a living allowance which was said to be equivalent with respect to the rent of PMQs.

One of the things that arose that one might say was disparate when you were trying to put things more on a basis of salaries and living in the same world as the civilians was why should the rent of an individual house vary with rank? In effect, you were saying that the senior officer received a greater allowance—before this time in order to pay rent—than the private or the NCO. When allowances were withdrawn and the people were given salaries, which were spent on the same things that civilians spent their money on, the whole question as to the treatment of the rent of the government-owned quarters arose. It was originally very strongly recommended,—that might not be putting it strongly enough; in fact we were practically told—that we must put the rental on a directly comparable basis to the locale in which the man was serving. This meant that if a service man had the misfortune, from the point of view of the service, to be posted to Toronto, he would have been expected to pay, or we would have been directed to charge him, a rent that might have been \$175 a month for a house that was exactly the same as the house that he would have been placed in if he had been posted, say, to a small area in Saskatchewan where rents were low and for which he might have only paid \$65 a month.

● 1555

The military—in this I entirely agreed with them—argued very strenuously, and it succeeded in convincing the Treasury Board and others, that since a military man served on a national basis and was paid on a national basis,—regardless of where he was he drew the same salary—therefore, they should make the rents of married quarters the same, irrespective of the location of the man, even though this would produce some disparity . . .

Mr. Winch: Overseas too?

Dr. Arnell: No, only with the local. I am coming to the overseas situation in a minute. This only covers the question in Canada. So it was agreed, after a year of very detailed study. Central Mortgage and Housing Corporation helped us, and there were surveys across the country. We had a tremendous amount of data, which included the actual pricing, of the equivalent rental of every married quarter in Canada owned by the Department of National Defence. An estimate was made of the total list and when it was finally all sorted out, it was agreed that rather than have the rent of an

individual type of house vary across the country, we would strike a national rental to this house that would be the same everywhere.

This would, in fact, return the same amount of revenue to the Crown. This, of course, ended up by producing rentals so we worked out a formula—because it is terribly difficult to find what the going rent is in a city. All that is required is to look at Ottawa and you will find the same house within five miles renting for as much as a \$25, \$35 or \$40 difference. When the Central Mortgage and Housing Corporation did their survey, it is interesting to note that the Uplands PMQs were given lower rentals by CMHC than the ones in Rockcliffe. There is a difference in the level of rents between the Uplands and the Rockcliffe stations. We produced a formula that satisfied Treasury Board, and everybody else, as to how we would arrive at the rent.

These rents are actually a little lower than those which, most people believe are the going rents in any given area. Since they were higher than the allowances which the lower ranks were receiving, it was agreed—when this was first instituted, either in 1967 or 1968, and I think it was April 1, 1968 when we finally worked it out—that nobody's rent could be increased more than \$15 per year until it rose to the figure that had been produced as being a reasonable equivalent to the market price. The government has a regulation—a rider of the previous one—which states that: in the lower income groups up to a salary of \$5,000 or \$6,000 . . . someone should check to be precise . . . no person can be charged more than 20 per cent of his salary for the rent of a government-owned accom-

● 1600

modation, or if all services are provided—including water and electricity—25 per cent. There is an upper limit that, in particular, privates can be charged for their rent. This system went into effect—there was wide announcements of the subject at the time—over a year ago now.

The question concerning the accommodation charge in Europe was one that could not be handled at the same time. On the other hand, it had to be fitted in to the general and broad principles that had been established. Before I deal with Europe, I must say one thing. As a result of this decision to put the government housing on an economic basis in relation to the civilian economy—which was aimed at the removal of what presented to be disparity between those who were lucky enough to get into a PMQ and those who were forced to live outside, because we had enough houses for only a third of the personnel—by the time the government completed the survey with respect to National Defence it was discovered that only about two-thirds of the total government-owned housing was the housing of the Department of National Defence.

Some—I forget how many thousands of housing units—were owned and used by other government departments—personnel of other government departments.

You may recall that at the time that the military rental scheme was announced, the government announced that precisely the same principles were being applied to all government-owned housing. In fact, the public servant who lives in a government owned house is experiencing exactly the same adjustment in rents as this.

When we came to the question of Europe, it was a matter of just how to deal with this. Two things were involved. First, there was the principle that was being applied to all public servants within Canada. The principle could be applied equally in Europe because there were those who were living in the PMQ's, and there were, in fact, those who were having to live on the economy.

Second, there was the fact that the government has a foreign service personnel policy which attempts to equate the costs and the conditions under which Canadians live abroad with the costs and conditions in Canada. A very elaborate scheme has been worked out, and this again took even longer than the rents.

The Committee that worked out the foreign service personnel policy was chaired by the Treasury Board staff and, in fact, had as representation all the major departments which have personnel serving overseas. This included, of course, External Affairs, Trade and Commerce, Manpower and Immigration, and ourselves, to name the four principals. I think there may have been one or two others.

Before anything was done with respect to the Canadian Forces in Europe, a very detailed survey was done of Europe by the members of the Bureau of Statistics, the Treasury Board staff, Central Mortgage and Housing, I believe, and ourselves. A similar type of survey was done over in Europe as was done in Canada. At the end of this, an equivalent set of data was accumulated to that which had been obtained here a year or two years before.

● 1605

April 1 is the anniversary date of these rentals. The first increase in Canada was April 1, 1968, I believe. Again rents went up \$15 for those who had not reached the ceiling under the guideline I mentioned. In fact, the European ones went into effect this year for the first time. This is the result of a policy that was announced a year and a half or two years ago. It was widely disseminated through the services and it is entirely unrelated, in fact, to any particular raise in pay right now, because it goes back to the decision of October 1966 to convert the military pay and allowance system to salary.

I hope I have not talked too long about this but I have been attempting to give you the philosophy that is behind this. Of course, it always gets equated to the present, but this is something that must be studied from October 1966 to April 1, 1969. The same thing will probably be true on April 1, 1970.

All the facts are available. If people are interested, we can show you, or at least can provide, a table that, in fact, shows the average rents that have been arrived at for the different classes of houses.

Mr. Winch: May I just ask this? To my knowledge, the last two increases in rent have been co-incidental with the increases in salary.

Dr. Arnell: The salaries were increased October 1 and the rents were increased on April 1.

Mr. Winch: I know, but prior to that there was an increase. When I was in Europe, it happened at the same time.

Dr. Arnell: Sir, the conversion from pay and allowances to salaries was in October 1966, and every change in military pay was in October 1967 and October 1968. We introduced the rental adjustments on April 1, 1968, and there has been a second adjustment, so they are, in fact, six months out of phase.

Mr. Winch: What I am referring to is that a few years ago a committee of this nature was overseas, and at that time there was a co-incidental increase with rents. It is a few years ago. However, I would like to ask you this because I think it is rather important.

Dr. Arnell: This, I think, is your overseas allowances business, which is quite a different matter again.

Mr. Winch: However, I would like to ask you this question because I think it has a great effect on morale. We discovered when we were there on a recent visit, and I had officers come to me and speak about this matter, that the increase in salary went into effect on April 1, and the increase in rentals resulted in a number of ranks receiving less than the take-home pay they had received previously.

Dr. Arnell: I think what you were talking about, Mr. Winch, does not have anything to do with salary at all. This is, in fact, the overseas allowance. The overseas allowance is related to Ottawa.

Mr. Winch: Why Ottawa?

Dr. Arnell: If you refer to the whole foreign service personnel policy, Ottawa was originally taken as a guideline because more people went from Ottawa

to overseas service than from any other part of the country. You could tie it to almost anywhere and exactly the same thing would happen.

What, in fact, has happened in recent years with this overseas allowance is that the effective inflation between Canada and Europe for a number of years was in a direction which resulted in the increase of the overseas allowances. This last year for the first time, I believe, I could be wrong in this, the inflation trend was reversed from what it had been in the past and, in fact, the allowance, instead of automatically going up, either dropped slightly or held the same level.

● 1610

Mr. Winch: Whether it is called salary increase or overseas allowance, may I ask if you are interested in the situation whereby through the increase in rents a number of our overseas armed forces are now receiving less in take-home pay? Are you concerned with that?

Dr. Arnell: We are very concerned with this, Mr. Winch. However, we are also concerned with the fact that almost every civilian in our Department is being met by increasing rents which are going up faster than our military rents. Those military personnel who must live in the civilian economy are having their rents increased faster than are PMQ's. We are attempting to introduce more equality; that is all.

Mr. Winch: I have been taking a look at this situation where a number of our armed forces are actually since April 1 receiving less take-home pay.

Dr. Arnell: We are fully aware of this and we are also aware that those who are not in PMQs are in fact getting less take-home pay; they are experiencing even a bigger loss in take-home pay because their rents have gone up faster than the ones that we have. As I explained to you, this is in fact part of a policy that has been agreed to, promulgated, and hopefully, understood by all, for several years and of which we are terribly conscious and sensitive. We have been trying all the way along to arrive at the best way of trying to make people live in an inflationary world.

Mr. Winch: I just have one more question. Has your Department, Dr. Arnell, stopped making any representation for the payment to our families overseas on family allowance?

Dr. Arnell: I cannot tell you precisely what the story is right at the moment. This has been a continuing matter of consideration in this whole question of foreign service personnel policy; I am not completely up to date. However, I know that the last time I was

involved, this was in fact one of the items on the books.

Mr. Winch: I have never been able to understand why the children of our armed forces overseas, are not allowed family allowances.

Dr. Arnell: I think the answer is that it is still under consideration. There is income tax consideration and other things.

Mr. Winch: Family allowance is not included in income tax? I could never understand why our people overseas cannot get this money.

The Chairman: Order, please. Mr. Buchanan, and then Mr. Harkness.

Mr. Buchanan: Dr. Arnell, I have been trying to extract the NATO costs from your presentation here. I can see from the Brigade and the Air Division, approximately \$150 million and another \$15 million, roughly, in vote 45 under Mutual Aid. Of course, in addition to that you have a certain amount of the Air Transport Command, Training Command, Canadian Forces Communication System, and so on, which are attributable to our involvement in NATO. Do you have any particulars on this that I could have, please?

● 1615

Dr. Arnell: As I attempted to explain to Mr. Cafik just before we recessed for lunch, we had had to do a certain pro-rating within these activities because, as I said on the first evening that we were meeting, the Blue Book was the way in which we had to prepare the estimates this year in the old form; if we went over to the other we really could not build it from the bottom up, because the way you put this type of budget together is different, so that there is a certain amount or pro rating.

We attempted to explain this in the narrative that begins on page 23 and goes on into page 24. Within NATO, you see that we indicate that this activity includes the following forces: the Brigade Group, the Air Division in Europe, the operational Maritime sea and air forces on the east coast of Canada, which are earmarked for service to NATO in an emergency. Included in this list are the support forces and installations directly related to those; then we go on to talk about the other roles in Maritime forces. Within the figures that you find on pages 22 and 23 in the table under NATO, you see that the proposed estimate for 1969-70 is \$321,658,000. These are the straight administrative O&M figures. This particular figure is made up of \$66,857,000 for the Brigade Group, \$67,654,000 for 1 Air Division, \$118.8 million for the Maritime forces and \$68 million for Direct Support.

This would include charging up the dockyard in Halifax, charging up the CF-104 OTU at Cold Lake, and this type of thing. That adds up to a total of \$321,658,000.

The capital which we show on pages 27 and the top of 28, and there we show it by ships, fighting vehicles, aeroplane engines and so on, breaks up in the same way to Brigade Group \$11,185,000, Air Division \$4,365,000, Maritime forces \$97.6 million, and Direct Support \$800,000. And NORAD . . .

Mr. Winch: What page is NORAD on?

Mr. Buchanan: Excuse me, before you go on to NORAD, you have lost me.

Dr. Arnell: I am talking about this book, Mr. Winch.

Mr. Buchanan: I am sorry, Doctor Arnell. You have lost me with your figures. I have the one vote here which is fairly straightforward in this book.

Dr. Arnell: I am talking of pages 22 and 23 on the White Paper, the top line; it is the NATO Alliance. You have the proposed man-years which are broken down in terms of the Brigade Group, 1 Air Division, the Maritime forces on the east coast, and Direct Support. They are not in the book, but if you are interested in how we made up that 27.9 . . .

Mr. Buchanan: And the \$321.7 million.

Dr. Arnell: And the \$321.7 million. I went through the \$321.7 million but I thought you were following it. I will go through the whole thing again. The same can be done for everything else, however, this I think will illustrate what we are doing here. Within the proposed man-years, at 27,826, Brigade Group is shown as 5,862 military, Air Division 4,597 military and six divisions, the Maritime forces—this is the East Coast Maritime—8,511 military and 40 civilians, and Direct Support is 3,446 military and 5,364 civilian. These give you 22,416 military and 5,410 civilian, which if you add them together—I am glad to see—comes to 27,826.

● 1620

If we go to the \$321,658,000 AO&M, the Brigade Group is \$66.7 million, Air Division \$68.0 million, Maritime forces \$118.8, and Direct Support is \$68.1. The capital that matches that in this particular case is \$11.2 million for the Brigade Group, \$4.4 million for Air Division, and \$97.6 million for the Maritime forces; I guess it is \$900,000 for Direct Support. To give you a figure of \$113,967,000 which is in the first column on page 23, if you follow across the table, it is the first one past the staple. That is how

we made that one up. In each one of these we have done pro rata of this type.

In order to be able to equate that to a figure like the Maritime Command that you find in the blue book, you have to pick up the other Maritime forces which are in the Joint Defence of North America and which, as I explained this morning, we have charged up to the West Coast. It is charged up on that side, and so it goes all the way through.

The figures are not necessarily going to come out to exactly the same dollar value. It will be essentially the same because there is some pro rating we had to do here. For this year it is an attempt to give you an understanding of the manner in which the forces are assigned.

Mr. Buchanan: Dr. Arnell, your forecasted expenditure for 1968-69 for AOM, I think you call it, Construction and Acquisition, is roughly \$406 million, which you would class as directly attributable to NATO? Am I correct?

Dr. Arnell: \$406 million?

Mr. Buchanan: I took the \$304,724,000 . . .

Dr. Arnell: Oh, yes, yes, yes.

Mr. Buchanan: . . . and added it to the \$102,677,000.

Dr. Arnell: These figures are even more uncertain than the ones this year, because this year we put them together with the knowledge that we had to produce this book. When we did last year's budget, it was a year before the new format had even been settled. We attempted the same type of chart, but this chart had not, in fact, even been sorted out when I appeared before you in November talking about 1968-69 figures. However, those were the best numbers that we could put on it when we put these estimates together.

Do not forget these estimates were originally put together last fall when we were trying to forecast how the money would flow in the last four or five months of the year. In fact, the forecast expenditures, as they are coming out right now, as we have now finished the end of the year, have modified somewhat from this. I do not have them here at the moment. But that is indicative of the way things have changed. Does that answer your question?

Mr. Buchanan: Fine, thank you.

Mr. Howard (Okanagan Boundary): The expenditure is about \$400 million a year for NATO?

Dr. Arnell: The navy, the Maritime forces on the East Coast, accounts for about \$120 million of that,

which you can, in fact, charge up in any one of three ways.

Mr. Buchanan: You have arbitrarily broken it down here.

Dr. Arnell: As we defined it, NATO accounts for all of this because, as I explained this morning, the Maritime Commander tends to develop his strategy in consultation with the Americans as SACLANT, rather than as a regional pact within NATO.

Mr. Winch: Does that mean, basically, that our Maritime Command comes under the Admiral in Norfolk, Virginia?

Dr. Arnell: In an emergency it does. It is an national command . . .

Mr. Winch: At Norfolk, Virginia.

Dr. Arnell: No, it is an national command in Halifax in peacetime.

Mr. Winch: It comes under Norfolk, Virginia on the operations.

Dr. Arnell: It does in the same way that the brigade group comes under SACEUR when we assign them in an emergency. They are national forces that are assigned in the emergency.

The Chairman: Mr. Buchanan do you have further questions?

• 1625

Mr. Buchanan: Yes. Dr. Arnell, does that \$120 million figure which you mentioned include the construction and acquisition, or is that AOM?

Dr. Arnell: You are speaking of the \$120 million?

Mr. Buchanan: Yes, I might have misunderstood you when you were referring to Maritime Command.

Dr. Arnell: No, that is the AOM figure. I gave you a figure of \$118.9 million as the AOM under Maritime. So I was just relating to that particular figure. The capital would, of course, be the \$98 million figure I gave you.

Mr. Buchanan: I am sorry. The \$98 million . . .

Dr. Arnell: When I went through the capital, I gave you the figures \$11.2 million for the Brigade Group, \$4.4 million for the Air Division, and \$97.6 million for the Maritime Forces.

Mr. Buchanan: Maritime Command comes to roughly \$400 million.

Dr. Arnell: The Maritime Command, East Coast.

Mr. Buchanan: I am sorry, East Coast accounts for half of it.

Dr. Arnell: The West Coast accounts for \$56 million total.

Mr. Buchanan: What percentage, or dollar amount, of our total budget is for new equipment?

Dr. Arnell: You can say the capital figures that are listed through Pages 27, 28, 29, 30 and 31 relate to new equipment in the sense that it is equipment being delivered under contracts that go back anywhere from about one to four years. The highlights of this equipment are, of course, in the piece of paper that was distributed before the April 17 meeting, the Selected Major Equipment Items. So, it is roughly \$243.5 million.

Mr. Buchanan: Does that figure include construction and acquisition of buildings, and the upgrading and improvement of existing equipment? I was just wondering if we could segregate the actual cost of new equipment as opposed to new construction and upgrading of existing equipment?

Dr. Arnell: In terms of major equipment, the only program that is listed in this list of Selected Major Equipment Items is the Restigouche conversion. The conversion, if you want to call it that, is an updating of existing equipment.

Mr. Winch: It has nothing to do with the four destroyers?

Dr. Arnell: No, they would be new equipment. But in the upgrading of equipment, the only major item that is in this whole list is the Restigouche conversion program. In addition to this, you could argue there is some upgrading of a minor nature that goes on in standard resupply. However, I do not think that you are talking about that.

Mr. Buchanan: Does this include the guns on the Centurions and this type of thing?

Dr. Arnell: No, I think if you have new guns, this would be new equipment. I mean smaller items again.

Mr. Buchanan: Then there is roughly \$200 million, or would you decrease that?

Dr. Arnell: Yes, the best figures to take are the ones on page 242 of the blue book which, in fact,

show \$19.6 million as the construction figure and \$210,432,000 for the acquisition of equipment.

Mr. Buchanan: Yes, that is roughly one-ninth. Is there not some suggestion that this is a very low figure to have for a modern force when you are spending up to ten per cent on new equipment. Is it not a bad ratio?

● 1630

Dr. Arnell: The point that I tried to make when first introducing this particular budget is that it is a hold-the-line budget with no new equipment programs in it at all. It reflects the end of the five-year equipment program that was embarked on and was approved in the fall of 1964. This was done consciously, and we were directed to do it this way because of the defence policy review.

It is our hope that one of the first things that will come out of the defence policy review will be new equipment programs. If some of the modified roles, or whatever it is that is going to come out or, in fact, if there are continuations of some roles, we will have to start thinking of re-equipment because it will eventually lead to that. It is our belief that next year's Estimates, will essentially be the beginning of another five-year program.

The Chairman: Mr. Harkness has been waiting patiently.

Mr. Buchanan: One final question. I also noticed that roughly 10 per cent goes to new equipment and 10 per cent goes to retirement allowances of various sorts. I think it is around \$107 million. It is an extension from the \$128 or \$129 of last year, which seems like a pretty substantial hike. Here we have a budget on which we are paying as much for retirement allowances as we are for new equipment. I wonder, in modern military forces, if it is not true that there is really much less stress on the physical fitness of the men concerned, than there is on expertise and acquired knowledge, than there has been in the past. Are we giving any serious thought to changing our retirement policy in the forces so that a lot of good men who were retired in their forties who are quite capable of carrying on the roles which they have for another 10 maybe 15 years, are kept on for that period? I think that you realize that to retire a man in his early forties and pay him a pension for the balance of his life is an extremely expensive proposition. Also, I think that man still has much to contribute; we might well be losing that contribution.

Dr. Arnell: There were several recent changes in the Canadian Forces Superannuation Act and one of them in fact, introduced the possibility of a deferred

annuity rather than a pension in the old sense for people over 20 years old. The other thing which is being seriously considered in the public interest is the question of finding a better way of integrating the military man as part of the Public Service, particularly the specialist type of man so that he may plan a full career.

Mr. Buchanan: In the service?

Dr. Arnell: Within the Public Service. As it is now, a man formally retires and then he goes into the Public Service and almost begins another career. This is not purely a departmental matter. This is being looked at on a broader basis. I would just like to draw your attention to one point in relation to the superannuation account. In the Superannuation Act the wording requires that we cover the government's contribution to the Superannuation account as part of our estimates. As far as the rest of the Public Service is concerned, this is covered in the Treasury Board account.

● 1635

Similarly, whenever there is a pay raise, the Department of Finance or the Department of Insurance in the Finance Department does a review every five years of the actual state of the account based on a standard formula. I am sorry, I said every five years; that should be everytime there is a pay raise, they assess what this should have added to the account to make up for this increase, and we get a figure from the Department of Insurance or Department of Finance for which we have to automatically provide, divided into five equal—

Mr. Buchanan: To meet your obligations?

Dr. Arnell: Yes—divided into five equal parts beginning the year of the pay raise. This is a Statutory item; you will notice on page 248 of the Blue Book that it is marked Statutory. In fact it begins on page 247, Statutory-Payments under Parts so and so. In addition to the several build-ups, we got a big actuarial addition at the time of the conversion from pay and allowances to salaries, because many allowances were not classed as salaries for pension purposes; so, the man's pension, the changeover to salary, gave the military man a much better pension.

Mr. Buchanan: Based on his total salary?

Dr. Arnell: The point is that this year we had to make up a five-year deficit. You may recall that there was a tabling, I believe it was in the House, of the deficit in the superannuation account that we had, so this has added to the increase. If you would like to look at page 439, you will find the equivalent at the

second last item from the bottom, of what the pay raises on the civil side has done to the rest of the actuarial adjustments. And you will find, in fact, that that actuarial has gone up more than ours has.

Mr. Buchanan: This is the \$139,333,400 and the \$228,623,000.

Dr. Arnell: Yes, now that represents the Public Service. I think it is about twice the size of the military forces. Much has been said you know, about changing the percentages and this sort of thing of calculation, but it is a Statutory item; it is not a cash item.

Mr. Buchanan: I was not as concerned about that; it is the principle. There are many competent and knowledgeable men who are going out of our services, in their mid-forties who still have a great deal to contribute.

Dr. Arnell: We are very conscious of this; the question still stands of finding a way of continuing them in Public Service. A lot of them, of course, do end up as civilians within the Department of National Defence. But they tend to be limited to that.

Mr. Ryan: A supplementary question. Does a military man have to relinquish his pension for the time that he takes another government position, like a member of Parliament has to do?

Dr. Arnell: As I recall, the regulation is that he can draw a pension up to the Warrant Officer level, and then draw his salary.

Mr. Ryan: Thank you.

The Chairman: Mr. Harkness?

Mr. Harkness: I have a few questions in regard to personnel. In March I got three returns in regard to the total strengths, discharges and so forth. The first of these gave the strength in the armed forces of January 31, 1969 as 97,798 but in the same return of those figures, there were 1,960 who were on terminal leave; therefore, they were in effect, out of the armed forces, which cuts down the figure to 95,838. There were a further 1,621 women with all respect to the lady members of the forces, who are in most cases doing what are really civilian jobs. If you subtract that, it brings us down to 94,217 men in actual military

• 1640

service at that time. Now is it the policy at the present time to maintain the strength at around that figure, or is it to be built up to the 100,000 that has been spoken of?

Dr. Arnell: For the last several years, the figures that have been quoted as the total military strength have been based on total personnel, including those on retirement leave. The 100,000 of last year, and the

98,000 of this year, are intended to include the amount of men on retirement leave. In fact, when we were answering, Monday afternoon a week ago, questions on the military establishment with Commodore F. D. Elcock, we discovered that the establishment itself carried a number of positions, not by ranks, in order to cover the retirement leave. The retirement leave in the establishment is shown as privates.

An hon. Member: As what?

Dr. Arnell: As privates for the purpose of numbers. As we discussed the other day they are included in the rank structure in the other book if I recall. We show in the new form on page 26, 1,388 within our total on Terminal Leave.

Mr. Harkness: The policy at the present time, is to maintain the number of people in actual service and doing a job around this 94-95,000 figure. I am talking about men now.

Dr. Arnell: I think it would fair to say that the ... What is the total number of females?

Mr. Harkness: You gave me the total of 1,621 as of January 31st.

Dr. Arnell: There is the book. The number on terminal leave or females is about 3,000.

Mr. Harkness: Well it is ...

Dr. Arnell: Females can be effective in non-operational jobs.

Mr. Harkness: It is actually over 3,500, but in any event the point is that this is the total general figure ...

Dr. Arnell: The total figure must include all these things.

Mr. Harkness: Which gives us really 94,000 to 95,000 men in actual military service. One of the other returns was the discharges of tradesmen by trade groups from August, 1968 to January, 1969 inclusive, and for the month of August, 1968 the total number of discharges in another return was 1,350. Looking over this list of 3½ pages of tradesmen, I find stewards, artillerymen, infantrymen, and military policemen. I have not counted those people as I do not look upon them as being people who have had highly technical military training. If you disregard them, the total becomes 240. This leaves 1,110 discharged people who are reasonably highly trained tradesmen of one sort and another. I have not done the same calculation for the other months, but by briefly looking at the return, it appears to me as though they would be very

comparable. It seems to me that the taxpayer has a large investment in the loss of these people. With the weakening of the forces, and in order to carry on the job effectively it is going to be a very difficult job to train a sufficient number of other people up to those standards.

• 1645

Dr. Arnell: This has been a matter of very great concern to the whole department. The simplest answer is that it relates to the problem of competing in the marketplace. In many of these specialized trades you cannot respond quickly enough and in some areas, where there is a shortage in the civilian side the men practically get hired away.

I think that it is a problem that everybody faces. Although this is out of my own particular area of responsibility, it is an area in which I have been very interested. I have not seen any very recent statistics, but I would like to take you back to the sort of problem one finds when examining these types of statistics. Seven, eight, or nine years ago—in fact I am not sure, it might not have been at the time when you were minister and perhaps you will remember this—but there was great concern expressed at the loss of the ROTP officers that had gone through either university or military colleges. The air force, in particular, were very concerned since after the fulfillment of the required service, one out of every three, left. Everyone said that losing a third was really very serious.

At that time, the general wastage figures in industry, taken in the total, was in the order of 9 to 13 or 14 per cent per yearly turnover. The loss of a third of the young officers came to be a terribly high one. I was Scientific Advisor in the air force at the time, but was an employee of Defence Research Board. Defence Research Board, at that time, had an extremely low wastage rate in relation to the national average. In fact, the DRB wastage rate was around 8 per cent, but it was two or three points below national average. I checked the DRB figures over a period of three or four years before that and found that it had lost one out of every two new employees within three years, even though they had one of the lowest wastage rates in the country.

A young college graduate particularly an engineer is traditionally taught that he should get experience in two or three different areas before settling down. From my study at that time, I had to conclude the fact that when a man was required to serve for three years following his graduation, the chances are greatly increased of retaining him. That was, in fact, the case.

Mr. Harkness: Did you say it was not, in fact, the case?

Dr. Arnell: The fact that you required him to serve the three years tended to keep him much more than if he had been allowed to go at his own whim in the first three years.

Mr. Harkness: That is the reason why we increased the period to five years for certain people.

Dr. Arnell: I feel that—although as I say, I have not seen any recent figures—the movement rates are probably not as bad and may be better than the movement rates of the equivalent tradesmen in industry. After all, industry pays a lot of the costs of training also. This does not answer the question. It does not make us happier but at least some of it is just human nature. I wish that we had an answer because I do not pretend that. . .

Mr. Harkness: Whatever the various reasons may be, the thing that concerns me is the extent of the shortage that now exists particularly in the more highly

• 1650

trained trades. Looking at the return, such people as artillery surveyors. . .

Dr. Arnell: I think, perhaps, that General Truemner might be able to give you some specifics on this.

Mr. Harkness: Those are the ones that are at the head of the list. I could pick out others such as cardiographic draftsman, bosuns in the navy, and so on.

Brig. Gen. Truemner: Artillerymen, sir.

Mr. Harkness: No, I was not talking about artillerymen. I subtracted them from my list.

Brig. Gen. Truemner: Name another and I will try to give you an answer.

Mr. Harkness: The artillery technicians, chief artillerymen, artillery surveyor happen to be the ones at the head of this list because it begins with "A", of course. In this return, he lost two artillery technicians in August, four in September, two in October, none in November, one in December and two in January. He lost 6 chief artillerymen, in December and three in January.

Brig. Gen. Truemner: I think I should try to answer this in a slightly different way. I think you will realize that we started the beginning of the fiscal year, 1968-69, with a strength of approximately 102,000 people. Our man-year average, or the number we had the ability to pay for, was 100,000. Therefore, by the end of the fiscal year we had to have the strength adjusted to 98,000. That is what you see there.

The attrition during that year was 12,000. We could hire only 8,000 people to bring about the 4,000 adjustment. Am I still making myself clear, sir? Of that 8,000 people—as a matter of interest, we brought in within 100 of the 8,000—about 1,000 of them were officers; the remainder were men and I know that at least 64 per cent of these men went into what I would call the “sharp end”, or the critical trades. That is the effort we made to cover up the shortages that you speak of.

Mr. Harkness: The point I am concerned about concerns the 1,350 who were discharged in the month of August, 1968. 1,110 of them are what I would call reasonably highly trained technicians of one sort and another. Only 240 people who entered the infantry, and spent their three years, received a minimum of what you might call technical training apart from the training as an infantryman itself, and then left. The replacements for these 1,110 men who you hired, these 8,000 you have mentioned, are all raw men who have to receive their training. The point that concerns me, which Dr. Arnell was talking about, is the drainage of these highly trained personnel and the effect which this has on the general effectiveness and efficiency of the forces.

Brig. Gen. Truemner: I believe you raised this question last autumn when this Committee sat, and you were given some figures, to which, I can refer, which showed that our operational effect was going up. I admit it was a percentage point. I can still report that the trend is in the direction that you would look for. I have the figures if you would let me look them up.

Mr. Harkness: I think you will perhaps remember I took considerable objection to those figures. I did not think they proved what you people were attempting to show they proved.

Dr. Arnell: Mr. Harkness, I must say I agree entirely with the point you are making, and it is a matter of very great concern to us. I really do not know that there is much else that we can say at the present time on this.

Brig. Gen. Truemner: I think you may know, sir, that we are instituting a program whereby after a five-year tour we are offering a man, under certain conditions, not another five-year tour but a career tour. This should help us redress to a considerable

inevitably, is going to reduce the efficiency of the forces. It is a problem. I think, which steps have to be taken to meet.

Dr. Arnell: There are some very major surveys that have continued to be made of the comparable salaries of equivalent jobs in industry so that one can attempt to match salaries. However this is not easy.

Mr. Harkness: However, I think there is one thing that has a bearing on this, and from complaints I have had from a considerable number of people, I think it has a considerable bearing, I have a return on this also. The question I asked was under present regulation are warrant officers and NCOs no longer allowed to read their confidential reports? If so, for what reason? The answer was that they no longer do see these confidential reports.

In other words, when an adverse report is made on them, they are no longer allowed to see it, and this has undoubtedly been a cause of very considerable complaint. I do not think there is any doubt that it is the direct cause of some of these highly trained warrant officers and other non-commissioned officers leaving the services.

The explanation that was given to me was along the line that discussions with supervisors concerning good or bad performance are encouraged and are taking place continually, as well as at the time of evaluation. In this way no shortcomings should be contained in the report unless the man is aware of such. Perhaps they should be, but very frequently they are not.

This is the complaint that I get, and I think that this change is one of the reasons why you are losing a certain proportion of these very highly trained men. I certainly would think that it would be highly desirable to return to the previous practice in which it was obligatory to show these people any adverse comments made of them in a report.

Dr. Arnell: We will certainly take note of your views, Mr. Harkness. I do not think there is really anything that I can comment on now. I think it is a valid comment and I will certainly see that it is seriously considered.

Mr. Harkness: Thank you.

The Chairman: Mr. Howard; I am sorry, Mr. Harkness:

Mr. Harkness: I have have two or three questions yet. I do not know to what extent this might help in the situation, but I am pretty sure it would help to some extent. There is the matter of the Town of Oromocto which was always the cause of very great difficulty all the time I was Minister, previous to that, and since that time. I see that the transitional grant this year is down to \$700,000. What I wanted to ask

•1655

degree the problem that you were worried about.

Mr. Harkness: I hope that proves to be the situation, because on the basis of these figures supplied to me, I, personally, have very little doubt that there is far too high a wastage of highly trained personnel, which,

was what is the situation with Oromocto? Are you finally getting rid of that headache?

Dr. Arnell: Yes, we have worked out an agreement with the province and, as it said, this is a transitional grant. I believe the first election of a real honest-to-goodness town council will be occurring this year.

Mr. Harkness: Will this mean that the Department will no longer have any responsibility for the Town of Oromocto?

Dr. Arnell: I believe the Province of New Brunswick is going to make it a real New Brunswick town.

Mr. Harkness: The Department of National Defence will then pay the usual municipal grant in lieu of taxes to the municipality, rather than running the town with these grants?

Dr. Arnell: They are going to elect a purely democratic elective council.

Mr. Harkness: What will be the amount of the grant in lieu of taxes which will be paid rather than these expenditures which have been made from year to year?

Dr. Arnell: I do not think we have it here with us.

Mr. Harkness: What I was trying to get at is what the actual savings on this will be?

Dr. Arnell: I think it will be a straight municipal assessment. I know I have not got the information here. I am not even sure that we would have anything other than a very general estimate. There has been a

● 1700

tremendous amount of discussion and meeting on this. I think our main aim is to make it a normal town and then attempt to treat it, in terms of any moneys we pay in lieu of taxes, exactly the same as anywhere else.

Mr. Harkness: You have no idea what the saving will be as a result of this?

Dr. Arnell: Somebody may have it, but I am afraid that I have not got it.

Mr. Winch: May I ask a supplementary on Oromocto? I do so as a member of the Public Accounts Committee because every year, including this year, we have the Auditor General's report. The amount of money advanced to Oromocto over the years runs into the millions of dollars, and the advances include the paying back of the interest. It is millions of dollars. Could you tell me, Dr. Arnell, whether or not you are

making, or will consider making, any recommendations from your Department to the Treasury Board that this now be wiped out, and not be a loan but a grant, so as to get it off the books, because it is millions of dollars and we get it in the Public Accounts every year.

Dr. Arnell: I am afraid I have not got the information with me, Mr. Winch, and I would think that in view of the recent agreement worked out with the province it should be possible to . . .

An hon. Member: Have it wiped out.

Dr. Arnell: . . . in fact to give the whole story to the Public Accounts and perhaps clear the books all together. It is not in my immediate area, and I really have not got the information here with me.

The Chairman: Do you have any further questions, Mr. Harkness?

Mr. Harkness: I have a further question in connection with another return I got, which asks whether Canadian armed Forces took part in an exercise in the Caribbean.

The reply was that;

. . . there were two exercises . . .

The further question I asked was:

2. Were they accommodated in a hotel or hotels and, if so, how much accommodation was provided and at what cost?

The return just says

2. 413 personnel were accommodated in commercial establishments . . .

It does not say for which exercise, and

. . . at a cost of \$41,585.24.

I would like to know on what exercise these people were? What was the cost per person for accommodating them per day in these hotels or wherever they were accommodated?

Dr. Arnell: Do you have that information, Colonel Kirby?

Colonel Kirby: I have not got the information specifically sir, but I think that the basic breakdown would be that the two exercises consisted of a reconnaissance for the exercise itself, because this was the first exercise that had taken place in that area.

That is probably why a higher number of personnel that usual were accommodated in civilian accommodations. I will have to get that information; I do not have it broken down.

Mr. Harkness: Is this the exercise NIMROD CAPER about which you are speaking?

Colonel Kirby: Yes, NIMROD CAPER was the RCR exercise itself, sir.

Mr. Harkness: The other exercise was purely a naval and air exercise and I presume there would be no hotel accommodations for it.

Colonel Kirby: I am sorry, that is another exercise entirely. That is a naval concentration.

Mr. Harkness: This return mentions both exercises, yet it does not say to which one the rental of hotel accommodation belongs.

Colonel Kirby: I would have to break that down, sir.

Dr. Arnell: If you would be agreeable we could provide you with more information on this. I think we could give you the actual information.

Mr. Harkness: I might say in explanation, that I received a couple of letters of complaint as to the fact that the armed forces were occupying very high priced hotel accommodation in the Caribbean. I do not know if this was Jamaica or where it was. It does not say here. It was in the Caribbean area and at the taxpayers expense; this is a complaint of some people who had been down there at the time; and they thought that this was a waste of the public money. I say this was the basis of the question to begin with.

Dr. Arnell: If you would be agreeable, we could give you more information in a return than we could give to you at this point.

Mr. Harkness: All right, that is fine.

The Chairman: Mr. Howard.

● 1705

Mr. Howard (Okanagan Boundary): Thank you. Mr. Chairman, I am intrigued by an item on page 30, Project MALLARD. I see that we are spending \$876,000 on it this year and we will have spent a total of \$1,080,000 on Project MALLARD. I am wondering what it is. It sounds like a duck hunting project. I would like to know if this is a recreational project for generals.

Dr. Arnell: I will ask General Davis to brief you on it. It is a communication system for the Army.

Brig. Gen. Davis: It is a very advanced communication system which is being developed by the four

armies of Australia, Canada, Great Britain and the United States. The word "MALLARD" is just a code name or was at the beginning; it has not any particular significance. It has nothing to do with NIMROD anyway.

The money being spent so far is in development, which is moving on in two or three phases and the cash that you see for 1969-70 is the DND share. The major part of this development cost, will in fact be dealt with by the Department of Industry. They will be providing the funds. This is so because it is a very expensive project. The Canadian share is 5 per cent of the total development costs, but it is expected that when this system goes into production, all of the countries that are engaged in the development, all four countries, will have at least a proportion, or perhaps larger than a proportional share in the manufacturing. This is very important to the Department of Industry, because through this particular development program there will be developed a large number of new techniques in digital switching and that sort of thing. They feel it is essential that Canadian industry should take part in this, and ultimately should take part in the very large production runs. This production of the over-all program—and this is talking in the era of the 1980's—is well over a billion dollars, including of course the U.S. point.

Dr. Arnell: I think that one might summarize this by suggesting that this is, as General Davis said, developing new techniques in a defence development project, in very much the same way as the ALOUETTE satellite program provided the basis for what is now a communication satellite development in Canada, which has nothing to do with defence, *per se*. In a sense it is really helping to build the basic industry, but this one is based on a military requirement, however, it is a *quagripartite* military requirement.

Mr. Howard (Okanagan Boundary): Is the actual detail of what is involved, a classified subject?

Brig. Gen. Davis: Yes, the equipment certainly is.

Dr. Arnell: Yes, and it is a four country project management group.

Mr. Howard (Okanagan Boundary): Thank you. Are any provisions being made to harden Canadian bases, either in Canada or overseas?

Dr. Arnell: I do not think there are any at the moment.

Mr. Howard (Okanagan Boundary): In that case then, are all our military facilities completely vulnerable to any kind of nuclear attack?

Dr. Arnell: Not North Bay.

Mr. Howard (Okanagan Boundary): North Bay is the only one? That is the only facility we have in our whole defence system that is reasonably invulnerable to nuclear attack?

Dr. Arnell: Yes.

Mr. Howard (Okanagan Boundary): Is there not any provision being made at the present time in any of our thinking or in any of our planning, to convert any other bases in this way?

Dr. Arnell: I think we largely believe in deterrents.

● 1710

Mr. Howard (Okanagan Boundary): I ask you, is it a deterrent if you are so easily wiped off the deterrent classification?

Dr. Arnell: The question that gets in here might be a subject of an entirely separate meeting, not really trying to deal with estimates. There are several ways of meeting this; an example which I am sure you were exposed to when you were in Europe, is the deployment plans for the CF-104's.

Mr. Howard (Okanagan Boundary): Yes.

Dr. Arnell: This is a different way; some people say it is cheaper while others say it is more expensive; it depends on how you look at it. This is a matter that needs study and that could be discussed if the Committee was interested in going into it, however, it is really not a subject that can be related to this year's spending.

Mr. Howard (Okanagan Boundary): All right.

Dr. Arnell: We have not got any right now, with the exception of maintenance checks.

Mr. Howard (Okanagan Boundary): I see that we are continuing our expenditures on the anti-submarine hydrofoil with another \$748,000 this year. That would bring our total expenditures to \$37.5 million.

Dr. Arnell: This is based on the trials because the hydrofoil is now in Halifax. My latest information is that it has now completed 10 foil-borne runs on three separate days. This is really the culmination of what has been a long period of developing a piece of equipment that now can be evaluated.

Mr. Howard (Okanagan Boundary): What do you feel we have accomplished here with a hydrofoil that we could not have accomplished with a destroyer and a helicopter?

Dr. Arnell: There are a number of things. One of them is the hydrofoil provides a speed that is intermediate between the ship and the Maritime Patrol airplane. It also has durability, or whatever you want to call it, endurance, in that it can sit somewhere. The trouble with the airplane itself or the helicopter is that it has limited endurance before it has to return home. The full tactical use of deferred speed within the Maritime is something that has never been evaluated. Here you have a whole new set of capabilities of sitting quiet at no speed or flying on your foils at a speed intermediate of the destroyer and the aircraft.

One of the things that really appealed to the Department when it was first put forward was the promise of operating an effective naval vessel to do many of the things that the big destroyer did with a tenth of the crew. The present DDE has a crew of 210 to 215. The hydrofoil's crew is estimated at 20 to 25.

Mr. Howard (Okanagan Boundary): Thank you. I have a question concerning nuclear submarines. Do we have any proposals or plans concerning nuclear submarines at all?

Dr. Arnell: There may be some plans buried somewhere but there are no proposals. People have been dreaming about this sort of thing for years, so I am sure somebody is dreaming, but there are no proposals at the moment.

Mr. Howard (Okanagan Boundary): What is the rough cost of a nuclear submarine without missiles?

Dr. Arnell: I do not know what it is at the moment. I was going to say that a few years back it was \$100 million. I hear he is still saying \$100 million. I thought it might have gone up.

Mr. Howard (Okanagan Boundary): Fine, thank you very much.

The Chairman: Gentlemen, if there are no other questions on votes 15, 20...

Mr. Winch: Yes, I have one.

The Chairman: Mr. Winch.

Mr. Winch: Concerning amounts recoverable, \$99,158,000, may I ask the doctor if we may have just a little bit of a breakdown here? I am particularly interested in our work. I believe that in Cyprus we are paying a fair cost. I would like to have a breakdown of this \$99 million and in particular what we get back. Do we get back anything for the services of our armed forces in countries such as Pakistan and Laos, and the peace commission in Viet Nam?

● 1715

We have carried on this work for years on behalf of the United Nations, etc., and I was wondering just what we get back of this \$99 million? As a matter of fact, Mr. Chairman, may we have perhaps a general breakdown of how you arrived at amounts recoverable of \$99 million?

Dr. Arnell: While someone is checking the U.N. figures, because I do not see it here, the largest item in this whole figure is the estimated return on the rentals of lodgings. The married quarters rentals is \$37.5 million and the single quarters rentals is \$5.6 million.

Mr. Winch: I am awfully glad I asked the question. Outside of the fact the majority of what you are going to get back is on rentals, which I raised before, I am awfully glad I asked that question now. However, on the straight use of our military forces, shall I say, in Cyprus, Pakistan, Laos, and the Viet Nam peace commission, what do we get back from that, if anything?

Mr. J. G. Grant (Information Services, Department of National Defence): Mr. Winch, this is for the fiscal year 1967-68 which is the latest that I have—in UNTSO, Palestine, non-recoverable \$281,000, recoverable nil; in UNMOG, India and Pakistan, a total of \$299,000, recoverable \$68,000; the forces in Cyprus, 1967-68, of a total of \$8,989,000, we were able to recover \$938,000. For Korea, we do not recover anything.

Mr. Winch: What about Viet Nam and our peace commission?

Mr. Grant: I do not think we cover that. That comes under External Affairs, I think. It is the International Commission for Supervision and Control.

Mr. Winch: This is most interesting because we are doing a job that we are apparently not recovering.

Dr. Arnell: It has been Canadian policy . . .

Mr. Winch: I agree with it . . .

Dr. Arnell: In cases like Cyprus we provide our forces. We pay for the cost of our forces.

Mr. Winch: Yes. I am not disagreeing with that. I only wanted to know what we are doing. I think you said Pakistan, \$290,000, of which only \$60,000 was recoverable. Why is there the difference between what you anticipated and the \$60,000 which was actually recoverable? Of so much, why was only \$60,000 recoverable?

Dr. Arnell: This was the total cost of that particular operation. He was giving you the total cost.

Mr. Winch: It is the total cost, but there was \$60,000 recoverable. In other words, except for a few thousand dollars then, this \$99 million is basically what you are charging our forces for rent, lodging, etc.?

Dr. Arnell: No, a great deal is recovered through cost-sharing with the Americans on our joint communications and air defence.

Mr. Winch: How much are you getting back from our armed forces on lodgings and rents?

Dr. Arnell: There is a total of \$43 million.

Mr. Winch: Your charge to our armed forces on rentals is \$43 million? You are getting back from our armed forces \$43 million for charges on rentals and lodgings. Does that include what they are being charged on other matters, or is the \$43 million just for Lodgings and rentals? What is the next biggest item there?

● 1720

Dr. Arnell: The charge for meals was \$12 million.

Mr. Winch: You charged \$20 million for meals?

Dr. Arnell: No, the charge was \$12 million.

Mr. Winch: This is becoming very interesting, but I want to hold up. May I ask then, with this kind of money coming back from our own armed forces being charged by the Department, do you not get any credit for the money which is made in the PX's?

Dr. Arnell: We have a certain name for that now—CANEX.

Mr. Winch: CANEX.

Dr. Arnell: It is not in direct relation to this type of thing.

Mr. Winch: Do you get any return in the Department from that?

Dr. Arnell: There are some charges for utilities and so on.

Mr. Winch: Are they charged rent?

Dr. Arnell: There is a charge for certain uses such as resale outlets etc. There is a total new policy being worked out. I think in the very near future

there will be a whole new policy promulgated on this, so I would suggest that it will become much clearer in the immediate future.

Mr. Winch: So, we should ask for that next year and not this year.

Dr. Arnell: Yes, I would suggest that this would be the best thing.

Mr. Guay (St. Boniface): I have a supplementary, Mr. Chairman, a very brief one, and it is with regard to the liquor store. In that particular store that Mr. Winch referred to, does the profit on the liquor sales come back to the government or is it retained by those who are in charge of the stores? I am making reference now to the liquor sales only.

Dr. Arnell: I am not sure that I can identify those liquor stores.

Mr. Guay (St. Boniface): You can buy any liquor that you want in these particular—what do you call them?

Dr. Arnell: You mean in Europe?

Mr. Guay (St. Boniface): Yes.

Dr. Arnell: The European setup is, in fact, entirely different from the Canadian one. I am not really sure exactly the details of the way in which it operates, but it is essentially to provide facilities that are not immediately available to the forces overseas. There is nothing equivalent to that in Canada.

Mr. Winch: I want to get this matter clear, if I may, because it has been raised, particularly if we read yesterday's or today's paper about Oromocto. In view of the fact that they can buy through CANEX without the normal taxation, is there any reason why that money does not come to your Department?

Dr. Arnell: No, they are required to pay all the normal provincial sales taxes.

Mr. Winch: No, I am talking about Europe.

Dr. Arnell: Oh, in Europe?

Mr. Winch: Yes.

Mr. Grant: In so far as the liquor store is concerned...

Mr. Winch: No, I am not talking about that...

Mr. Grant: Concerning the sales out of CANEX, I am informed that the profits go to the base concerned for

recreation purposes—if they want to build an ice rink or the like.

Mr. Winch: That is certain, is it?

Mr. Grant: Yes, indeed.

Dr. Arnell: There are no individuals making anything off this, I can assure you that.

Mr. Grant: Nor does the Department. It is returned to the men. It is the men's CANEX, and if they...

Mr. Winch: Could we have some indication, sir, just in principle, as to what type of planning—of which you are going to tell us about next year—is going on?

Dr. Arnell: A total new policy—at least a total policy on the entire operation—is in the final stages of being worked out now in consultation with the Treasury Board, and this will be available.

Mr. Stewart (Marquette): My questions are along the same line. In certain bases, particularly Camp Shailo in western Canada, they are discontinuing medical service to the dependents from April 1. The minister of Defence stated in the House that this scheme, upon which a three month trial was run, was costing too much money. What I do not understand is that the payment is deducted from the paycheques anytime these services are used, and this money is forwarded to the Receiver General for the use of the equipment in the laboratory and such like. However, less than 30 per cent of it ever gets back to the Department of National Defence.

● 1725

Dr. Arnell: This year we were able to have the regulation changed and we are in future to be allowed to recover the full cost of this treatment to dependents.

Mr. Stewart (Marquette): Will this change your policy then as far as dependents' medical service is concerned?

Dr. Arnell: I think one of the questions that does come into this is whether there are sufficient doctors and medical personnel to take care of all the dependents in these camps. It has been the policy, because we simply do not have enough medical facilities to take care of all the dependents everywhere, to limit the provision of dependent—or at least medical service to dependents—to camp or base areas which are remote, where there is just no civilian equivalent available to them. I do not know specifically about Shailo, but it may have had its category changed in terms of medical...

Mr. Stewart (Marquette): I think that at Shilo approximately \$6,000 a month was deducted for this and forwarded to the Receiver General. As I say less than 30 per cent of it gets back to the Department.

Dr. Arnell: Now it will be 100 per cent.

Mr. Stewart (Marquette): If the doctors were available, they could have dependents' medical service then.

Dr. Arnell: The present policy is that medical service is provided only to the dependents in remote areas. There is a definition of this. It is limited to where there is a need rather than trying to run a medical service to take care of all the dependents in a place like Ottawa, for example.

Mr. Stewart (Marquette): You do not know what the definition is used for remote areas?

Dr. Arnell: I think Mr. Grant can add to that.

Mr. Grant: Mr. Stewart, as you know, there was a project carried out in Base Shilo which is not, essentially, an isolated base. In an attempt to try to make available medical facilities to the dependents at Shilo, the Canadian Armed Forces carried out a pilot project for about three months, during which time they provided the doctors and the care for the dependents. At the end of that three month pilot project, a plan, which estimated that they would have to have quite a number of doctors and nurses in order to make the thing work properly, was sent in to training command. We just do not have the doctors available; those who are available have to go to isolated places and to the Armed Forces.

Mr. Stewart (Marquette): Very good then. How do you define an isolated base?

Mr. Grant: An isolated base, I would suggest, is one where it is almost impossible to get to a civilian doctor, such as . . .

Mr. Stewart (Marquette): Would 25 miles not be an isolated base?

This happens quite often in western Canada. In a case where the serviceman himself might be away on a course and the family were left by themselves on the base from which they would have to drive 25 miles for medical service—there being no other form of transportation as their private transportation, I think that would be an isolated base.

Mr. Grant: As I recall it, Mr. Stewart—this is just off the top of my head—there was a doctor at Base Shilo, a civilian doctor. The Department of National Defence had made available to him certain facilities that he

could use. I think he even lived on the base and a PMQ was rented. The doctor left that practice, and I am informed it was because he was not getting the number of cases that would allow him to practice at his level. This, then, is where it started out. Before that the dependents were going into Shilo.

Mr. Stewart (Marquette): The dependents, yes—they were at that point. How do you classify an isolated base, though, in, say, a case of 25 miles with no transportation?

● 1730

Mr. Grant: Base Shilo had been not considered to be an isolated base because there were good highways—they are only 25 miles away—whereas in Cold Lake there are very few doctors and they are far away from the medical centre.

Mr. Stewart (Marquette): There is no bus service.

Mr. Ryan: Dr. Arnell, Brigadier Amy before he left the command of the Fourth Armoured Brigade at Soest in Europe, was very concerned about the lot of his single soldiers—that is other ranks, soldiers who were living in barracks of quite a low grade. Has anything ever been done to improve the lot of the single soldier?

Dr. Arnell: There are, of course, a number of those old barracks that had been converted from whatever number were in it into the smaller units, rather than everybody living in one big open room.

Mr. Ryan: They are still stable-like quarters of rather low . . .

Dr. Arnell: There has been no program to do anything other than convert the insides of the building.

When you were there did you see any of those converted barracks that had been turned into the four-man rooms?

Mr. Ryan: No, not when I was last there.

Dr. Arnell: I thought perhaps you might have, because in this most recent one there have been a number of those old blocks converted into quite modern quarters—four-man rooms for the privates, two-man rooms for the corporals, and single rooms for the sergeants. All contain wash basins in the rooms, and the whole thing has been brought more into line with what you would expect for modern living quarters, multiple accommodation.

Mr. Ryan: I am glad to hear that. When we were at Soest the Committee did not have an opportunity to

inspect those quarters. I am glad to have that cleared up.

Mr. Winch: Mr. Chairman, let me put it this way. I do not know if you are going to sit tonight, but if you are, I was going to say that unfortunately I will not be here because a number of us have a commitment on an interview on Public Accounts. As far as I am concerned there is only one question on defence estimates which I would like to ask.

The Chairman: Is it about these votes or on some other vote? We would like to finish the defence estimates today.

Mr. Winch: If it was asked in the ten minutes that I was absent this afternoon, because we were at Public Accounts, then I apologize. It is the only question I have. In this morning's newspaper it is reported that the CF-5 is now being delivered to our forces. Could Dr. Arnell tell us what is the role of the CF-5 which is now, I am informed, being delivered?

Dr. Arnell: It continues to be the close support of the ground forces.

Mr. Winch: In Canada?

Dr. Arnell: With the Mobile Command forces. The first training squadron, I think, is what is being built up now, and it is the intent, as the pilots are trained and the aircraft becomes available, to establish two squadrons.

Mr. Winch: I am just going now by this one statement that said deliveries are now being made, the aircraft had a very short range, and no orders have been put in for a refuelling tanker. Is this correct? I just want to get the picture of it now.

Dr. Arnell: I think the question of the refuelling tanker was discussed last year, Mr. Winch. It is the problem that when we attempted to buy an aircraft it was not available to us. In fact, we attempted to place an order, but could not place it for the C-141 which was to be bought for that job.

Mr. Winch: I am sorry, but would you please explain to this Committee how the short range CF-5 is in support of ground forces in Canada? It cannot be used overseas unless if you have a refuelling tanker.

Dr. Arnell: It can be used overseas.

It can be ferried overseas but it cannot be flown non-stop.

● 1735

Mr. Winch: How is it in support of our ground forces in Canada?

Dr. Arnell: The forces are, in fact, being developed—if we go back over the history of some of this—to be able to do certain jobs away from Canada. The question of air transportable forces is only one of the ways that the forces can in fact be ferried away from Canada. It is possible to put the types of forces that are intended to be trained under the present programs where the CF-5 squadrons will train and exercise in support of one or other of the combat groups in Canada. Thus, the ground troops of those combat groups and the CF-5 could, in fact, be moved to another place. They cannot be flown as a single package on a non-stop flight, but the airplanes and the troops could, in fact, be delivered to Europe, or to somewhere else, given a period of time. It could be short, depending on how many troops, but the CF-5 could get across the Atlantic in exactly the same way that the Sabres get across the Atlantic.

Mr. Winch: Is my understanding correct that the aircraft is now being delivered in Canada to be used for training of our people as a plane for ground support; but in Canada, in actual fact, it has no use of support of our ground forces. This can only be if it is overseas and transport. Have I got that right or wrong?

Dr. Arnell: I think that, in general, you are right, but on the other hand one of the commitments that our forces have is the question which, I think, we judge as being a very low risk. We used to call them enemy incursions. I do not know what we would call them now in outposts of empire within the country. In fact, if you want some close ground support of forces, if we have to have enemy lodgements, dislodge enemy lodgements, this is an airplane that could be used.

I might say that the whole future role of the CF-5 like everything else in the forces is currently under review—as is everything else that we own.

Mr. Winch: But you are already committed?

Dr. Arnell: At the present time the plans are, as I recall, that we are going to establish one training squadron, which will be at Cold Lake, plus two operational squadrons in close association with two of the combat groups. I think I am right on that.

Mr. Winch: Am I also right, from my memory of the paper, that you are committed to \$205 million worth of CF-5's?

Dr. Arnell: Yes, we are taking delivery of 115 airplanes.

Mr. Harkness: The most ill-considered expenditure we have ever made, in my view on defence.

The Chairman: Are there any further questions on votes 15 and 20?

Mr. Ryan: I have a supplementary just on that point, Mr. Chairman. Could we not get some assistance from the Americans in connection with refuelling these planes if we wanted to send them overseas in an emergency? This, we feel, is always a possibility, but one of the problems is you have to train for refuelling before you could send somebody over, and we have not, in fact, looked into this possibility yet.

Mr. Winch: Could I then ask, Dr. Arnell. Are these CF-5's we are now getting, equipped for refuelling?

Dr. Arnell: Yes, they are.

Mr. Winch: They are equipped for refuelling. You have no plans of getting your own tankers for them?

Dr. Arnell: We had plans but we could not get them, so we have no way of getting them at the moment.

• 1740

Mr. Ryan: I was just going to ask if you have lost all hope of getting a C-141. Perhaps they might have one on the secondhand market—that might be helpful.

Dr. Arnell: There might be one on the secondhand market some day.

The Chairman: We can then, perhaps, go on to the next series of Votes. I will call Votes 25, 30 and 35 under Defence Research.

DEPARTMENT OF NATIONAL DEFENCE

Defence Research

Defence Research Board—

25	Administration, Operation and Maintenance	\$33,515,000
30	Construction or Acquisition of Buildings, Works, Land and Equipment	\$ 6,384,000
35	Contributions in support of defence research programs	\$ 7,500,000

Are there any questions on those votes? We will stand them and take them as a group a little later, but there are no questions, I gather, on any of those votes?

Mr. Winch: May I just ask a question here on Defence Research—and I am coming back now to the hydrofoil. The government paid a considerable amount of money to various companies in Canada to undertake research for equipment on the hydrofoil,

and I know for a fact, because I was there, that research paid off in certain areas. The Public Accounts Committee were informed that there was no procedure and nothing done on patents or licensing. In view of the fact that you are directly responsible in your Department for the hydrofoil development, have you given any thought at all to following through that the Canadian investment with Canadian companies on research has paid off?—that you should not, as a department, get a return? I am not going into details but I could give you details on where it really paid off.

Dr. Arnell: I am not sure of what the actual arrangements are that DDP make in their contracts to companies with respect to patents in that sense, but I think the procedure has become fairly standard now in a number of countries. If in fact, there is a successful development which goes into production, and that production is successful in offshore sales, there is now a formula that everybody recognizes—development costs are amortized against the sales, and in the case of the industry the latter pays back to the Crown certain things that it has received. There are a number of areas in this, and I would suggest that the detail would have to be obtained from DDP. But it is recognized, there are ways, and the Crown reserves the right in any development with respect to other military forces.

Mr. Winch: Thank you. I would like to say that, had it been brought to your attention, I would be glad to discuss with you one development that really paid off and has already been bought by the United States Navy, the United Kingdom Navy, and others who are interested in the development of Canadian research.

Dr. Arnell: The Crown has recovered for some of these, I know.

Mr. Winch: Not on this one. They have not recovered on it.

The Chairman: If there are no further questions on the Defence research votes, perhaps we could stand them for the time being and pass on to Mutual Aid, Vote 45. Are there any questions on Vote 45?

I will call Vote 45.

DEPARTMENT OF NATIONAL DEFENCE

Mutual Aid

- 45 Contributions to infrastructure and the military costs of the North Atlantic Treaty Organization and the transfer of defence equipment and supplies and the provision of services and facilities

for defence purposes in accordance with section 3 of the Defence Appropriation Act, 1950, not exceeding a total of \$15,486,000 including the present value of defence equipment or supplies or the cost of services made available by the Canadian Forces estimated in the amount of \$1,286,000 and provided by appropriations for those Forces in the current and former years in respect of which, notwithstanding sub-section (3) of section 3 of the said Act, no amount shall be charged to this appropriation or paid into a special account; provided by this vote . . . \$ 14,200,000

Vote 45 stood.

DEPARTMENT OF NATIONAL DEFENCE

- 48 To authorize, notwithstanding the Financial Administration Act and section 11 of the Surplus Crown Assets Act, the payment into the special account in the Consolidated Revenue Fund referred to in National Defence Vote 48 of the Main Estimates for 1965-66 of all revenues received during the current and subsequent fiscal years from the sale of surplus buildings, works and land \$ 1

Pensions and Other Benefits

- (S) Payments under Parts I-IV of the Defence Services Pension Continuation Act, Government's contribution to the Canadian Forces Superannuation Account, Government's contribution under the Canada Pension Plan in respect to Canadian Forces and Government's contribution to the Regular Forces Death Benefit Account under Part II of the Public Service Superannuation Act \$195,720,764
- (S) Annuity to the widow of the Honourable Norman McLeod Rogers and payments to dependants of certain members of the Royal Canadian Air Force killed while serving as instructors under the British Commonwealth Air Training plan \$ 11,720

The Chairman: If there are no questions on Vote 48 we will stand that vote for the time being and pass on to Vote 50, which I will call.

DEPARTMENT OF NATIONAL DEFENCE

50 Civil Pensions as detailed in the
Estimates \$ 2,390
\$ 195,734,874

The Chairman: Stand Vote 50 and we will pass on to Vote 55 which deals with Defence Construction (1951) Limited.

DEPARTMENT OF NATIONAL DEFENCE

B-DEFENCE CONSTRUCTION (1951) LIMITED

55 Expenses incurred by Defence Construction (1951) Limited in procuring the construction and maintenance of defence projects on behalf of the Department of National Defence and procuring the construction of such other projects as are approved by Treasury Board \$ 2,195,000

Mr. Cafik: Mr. Chairman, on a point of information. I am sure it does not come under this department, but who operates Canadian Arsenal's? Is that the Department of Supply and Services or Defence Production?

● 1745

Dr. Arnell: It is a Crown company but functions through the DDP which. . .

Mr. Cafik: I see, it is under Supply and Services. That is under their jurisdiction, thank you.

The Chairman: Are there any questions on Vote 55, Defence Construction (1951), gentlemen? A number of our members have had to leave. Since this hearing has gone on so long, we will have to come together at 8 o'clock tonight to pass all the votes which we have stood. However, I would assume that there would be no further questioning—or very little further questioning, at any rate—but possibly, Dr. Arnell, if we could impose upon you just in case there are additional questions, we should be able to conclude our review of the Defence estimates, I would think, rather quickly. . .

Mr. Winch: Unfortunately, Mr. Cafik and myself will have to be absent tonight.

Mr. Cafik: I wonder, Mr. Chairman, if a census could be taken by all parties to make sure that we have a

quorum at 8 p.m. I think that the thing could be dealt with rather quickly. Perhaps we could all attend. I know I could be here for 15 minutes or so?

The Chairman: We will try to make such arrangements. If those who are not at other Committee meetings could be here for even a few minutes, I think, perhaps, we could get a quorum and get all the votes passed.

Mr. Ryan: Mr. Chairman, perhaps while we are waiting for a quorum this evening, we could have from Dr. Arnell an indication of what the difficulty is of this aircraft that Mr. Harkness earlier so vigorously integrated. I understand that there is still a good deal of use in this plane as far as training purposes and utilization overseas is concerned.

Dr. Arnell: It was designed, of course originally as a trainer and it has never lost its utility as such. It gives a supersonic capability in the training role, and I think it has always been our intent that, ultimately, it would replace the T-33 as our advanced jet trainer.

Mr. Ryan: I think that it is still of great use to us, despite the fact that no refueler has been designed for it.

Dr. Arnell: We are now getting a number of them as duals for training and it is the view of the trainers that, if we did the conversion, we would have to acquire more of them as duals. You do not have to get them all. But there is a stage at which you want people to learn to fly the real single-seater, anyway.

An hon. Member: A supplementary, Mr. Chairman.

The Chairman: If I may interrupt for a second. Could all members of the Committee who are here now be sure to be here at 8 o'clock sharp, and ask any other members of the Committee who are back from other meetings to be here at that time?

Dr. Arnell: I would assume that my experts are not required tonight?

The Chairman: I would think that they would not be required.

Mr. Guay (St Boniface): On a supplementary, I believe that some of the members are leaving, including Mr. Harkness. I feel, with all due respect to you, Doctor, that the answer to the question regarding the CF-5 was not in the least the type that I had anticipated. In view of the answers, pertaining to the use and importance of those planes overseas, which we did receive, I will concede that, possibly, it was relatively short notice for you to give an appropriate answer, as suggested by Mr. Ryan just now. But I think it would be of great importance if this Com-

mittee were to get an answer pertaining, to their use and how important they are. If indeed, they are not, then I think we should be made aware of it. While we were in Europe we had occasion to discuss the matter with certain army personnel of our own Canadian forces, who told us that these were very good planes—and spelt out their uses and everything else.

Mr. Ryan: I think we are mixed up between the CF-104 and the...

Mr. Guay (St. Boniface): Yes, maybe I am.

Mr. Ryan: Yes, it is confusing.

Dr. Arnell: I started to say though, I was under the impression that, when General Dare gave you the long briefing on the military forces and the forecast for the immediate future, he covered the CF-5 and its use in some detail. I was going to say to Mr. Ryan that if he really wants me to talk about it for a few minutes tonight, I am, in fact, going to go back and check to see what you have already been told, because I do believe that it is all in your record.

Mr. Winch: I see.

Dr. Arnell: From General Dare's presentation.

● 1750

Mr. Cafik: Just one question. I am a little mixed up now. I agree with what you have said on this. I have the opposite impression as to the usefulness of the CF-105.

Mr. Ryan: Have we agreed that it is the CF-5 that you are talking about?

Mr. Cafik: The CF-5, yes.

Mr. Ryan: Are you not talking about the same one they are using in Europe, the CF-104?

Mr. Cafik: Yes. I am now asking a question as to the range of the CF-5.

Mr. Guay (St. Boniface): I am sorry, in fact. . . .

Mr. Cafik: I had the impression it was some 400 miles in each direction.

Dr. Arnell: How do you get something of that sort?

Mr. Guay (St. Boniface): On a point of order, Mr. Chairman, the reason why I do not believe, that I am so mixed up is because when we did speak of delivery of these planes, we were told in Europe by someone—and I think that I may have it in some of the notes that I have in my office—that we could take delivery

of them in Europe, because then they would not be all in one piece. They could be assembled once they received them overseas.

Dr. Arnell: Of course this is no problem. I mean we can always take the wings off and put them on the aircraft carriers.

Mr. Ryan: I am sorry Mr. Guay, I just thought—

Mr. Guay (St. Boniface): But over and above that there was quite a bit of discussion. I do not say a lengthy discussion, but sufficient to make us believe, or at least make me believe, that they were excellent planes for the use to which they were going to be put. I think that no one on this Committee—to whatever party they may belong—or the press, should be left with the impression that we are going into something which might be of very little use. I think this should be spelled out to the Committee.

Dr. Arnell: I will try to get that information before 8 o'clock.

The Chairman: Gentlemen, it is agreed that we try to be here at 8 o'clock and pass the votes as the first item of business. Then, perhaps, in an informal way, Dr. Arnell can describe the function of this particular plane. The meeting is now adjourned until 8 o'clock in this same room.

EVENING SITTING

Thursday, May 1, 1969.

● 2013

The Chairman: Gentleman, we are ready to begin our formal proceedings.

Votes 15, 20, 25, 30, 35, 45, 48, 50 and 55 are agreed to. Shall Vote 1 carry?

Mr. Winch: On division.

Vote I agreed to on division.

The Chairman: Shall I report these estimates to the House?

Some hon. Members: Agreed.

Mr. Winch: I say "on division" because we have not had a proper statement. So I say "on division" on Vote 1.

The Chairman: Thank you very much. However, we should have carried every vote. Gentlemen, this completes our formal proceedings but I think Dr. Arnell wishes to say a few words about the plane which was referred to this afternoon.

Dr. Arnell: As a result of Mr. Ryan's suggestion, I have asked General Adamson, who is the Director General, under General Dare, concerned with air operations, to give you a short outline of the current plan and program for the introduction of the CF-5 into the service, so that you can see just how it is going to be phased in. I will now ask General Adamson to outline it quickly.

● 2015

Brigadier General D. R. Adamson (Director General, Operations — Air, Department of National Defence): Thank you, Mr. Chairman and Dr. Arnell. As Dr. Arnell has said, I am the Director General, Operations — Air. The CF-5 is a twin-engine, tactical, close support aircraft, with a super sonic capability. It was procured for close support of the ground forces, interdiction, and reconnaissance in a conventional role. It has the additional capability of becoming, at some time in our program, a replacement aircraft for the T-33 trainer. The aircraft has a still-air ferry range of 1,500 miles. It can, of course, carry a number of operational weapons loads within that range, depending on the weapons carried and the altitudes flown.

At this time, the aircraft is in operation at OTU at Cold Lake in limited numbers. The unit there is the Operational Training Unit, and it is training crews for the two squadrons that we are going to form, one at Bagotville and one at Namao.

The Chairman: Are there any questions?

Mr. Howard (Okanagan-Boundary): I have a question concerning the range. You said it had a range of 1,500 miles. Is this a ferry range?

Brig. Gen. Adamson: That is a ferry range.

Mr. Howard (Okanagan-Boundary): What is its fighting range?

Brig. Gen. Adamson: As I indicated, it depends. It has any number of combinations that you would care to mention within the 1,500 miles, depending on the weapons you supplied it with and the altitudes at which it is flown. I am sure you will understand this in the vernacular. If you go high, low, high, you are going to get more range out of the airplane than with a low, low, low profile. I think if you wanted to pick on the optimum balance between weapons and fuel, at a 200 nautical mile radius, or a 400 mile range—these are nautical miles I am quoting now...

Mr. Howard (Okanagan-Boundary): In other words, it could not fly from Toronto to Montreal and back again under operational conditions?

Brig. Gen. Adamson: Well, I cannot . . .

Dr. Arnell: I think the point is that in close support of the land forces, one wants an attack close to them rather than 100 miles ahead of them. Once you get beyond a certain point the plane ceases being a close support weapon. One then enters into tactical or strategic strife.

Mr. Howard (Okanagan-Boundary): In the European role of our air brigade in Europe, would this range be satisfactory? Working from the base at Lahr, for example, could it perform the function that the 104 is doing now in being able to attack Soviet bases from Lahr?

Brig. Gen. Adamson: The quick answer of course, is that it was announced at the time the aircraft was procured, that it was not intended to be a replacement for the 104.

Mr. Howard (Okanagan-Boundary): No, but I am just suggesting this as an example. That range would be too great?

Brig. Gen. Adamson: I do not know what bases you have in mind, but, no, it cannot fulfil the role that the 104 is fulfilling in Europe now.

Dr. Arnell: There are problems other than the range itself. The 104 has an extremely sophisticated navigation system that is designed to allow it to penetrate deep into enemy territory and, in fact, to hit a pinpoint target. Close support of the land forces is an entirely different role that has an entirely different sort of navigational problem. The CF-5 has not been given, for example, the navigation equipment that is equivalent to CF-104.

● 2020

Mr. Howard (Okanagan-Boundary): I can understand the role of the CF-104, but I am trying to envisage a position in which you would put the CF-5 in today's fighting. It would be useless to us in Europe, in other words, under NATO conditions at the present time. Our bases are too far back from the Soviet border for it to be of any use to us now. I am just trying to envisage a role for it in Canada.

Dr. Arnell: I think the problem is this business of roles in Canada. If you go back to the time at which the decision was made to buy it, we spoke of two things that were to be roles for the Canadians: these I do not think were fully understood by a lot of people, peacekeeping and peace restoring. Many people did not appreciate what peace restoring meant. Peacekeeping is where there is peace and you go in to stop them from fighting again. Peace restoring

is where you have to fight your way. One of the concepts, rightly or wrongly, of close support of land forces, is where in fact you were peace restoring, where there was a war, perhaps a small one. If you were to analyse, as I think you have done already with many of your witnesses, what has really changed in this, particularly is the U.N.—the concept of how the U.N. might work these days—peace restoring is not spoken of today with the same freedom and goodness that it was spoken of four and five years ago.

This, I think, is one of the essential problems that one finds, because people do not give this too much credibility today. You do not go in and fight to stop a war under the auspices of the U.N. Our tendency has been to do peacekeeping work rather than peace restoring. In fact, another word has arisen and this is the peace observance, as well as the peace-keeper. The peace observer is essentially the officer professional who is there to judge what he sees rather than to keep the peace.

This is where you get the difference between what we did in the Indian-Pakistan situation over Kashmir, where we practised peace observing; there was a very small group of senior officers who were present to judge what they saw. Cyprus has been peacekeeping, UNEF was peacekeeping where, in fact, we were put in between two groups that had, been fighting and who we hoped would not fight again.

Mr. Howard (Okanagan Boundary): Does the CF-5 require a technically advanced base as the CF-104 does? Or is it a type of front line fighter that can operate out of comparatively limited fields, short take-off and landing or anything else of this kind? Do you have to have all the facilities of long runways and sophisticated equipment that a CF-104 must have?

Brig. Gen. Adamson: Once again, you must come back to the question of what you want to put on it for it to do any particular thing. However it can operate with less sophisticated facilities than the CF-104 can: it is not an airplane that is going to operate off dirt drifts in the front line, sort of thing, but it can operate under less sophisticated facilities.

Mr. Howard (Okanagan Boundary): It could operate from a permanent basis, in other words.

Brig. Gen. Adamson: It can operate from a hard surface runway, yes.

● 2025

The Chairman: Mr. Guay.

Mr. Guay (St. Boniface): Mr. Chairman and General Adamson, the immediate impression that was left with

me after listening to the various questions this afternoon by some members of the Committee, created a question in my mind, as to the usefulness of these planes. I am asking this question to you then, because of this impression and because, possibly I know very little about the planes. My question is, is this an item that your department really wanted? Is it an asset to your department in its training program, whether it is overseas or in Canada? Is this plane something that has been, more or less, forced upon you to take and make use of. Is it not as effective as another type of plane which you would rather have? I think that my question in its final analysis would be, if it is not the type within the category which I have just explained, I think that this Committee should be made aware of it, and to outline once and for all, if it is an asset or if it is not. If it is not, then we will take another turn of questioning to that end.

Dr. Arnell: I would like to answer this by a little historical review, if I might. I might preface my remarks, Mr. Guay, with something that I believe I discussed in a slightly different context on the night of April 17, in response to a question of Mr. Nowlan about system studies. I do not know if you recall, he was asking me how we did various things. I alluded to this, as I recall, but I would like to discuss it in a little more detail now, because I think it is very pertinent.

In this period, as the study went on over 18 months or 2 years, the Air Force, in looking forward as to future operational requirements to try and identify the kind of aircraft that might be in the next generation, if you like, of aircrafts, set up as a broad system of study, a look at what has since become commonly known as a broad set of scenarios of all the possible sorts of things that might, in fact, happen to disturb the peace. Within the broad cut of the scenarios was everything from what I would suggest would be a tribal war in the desert, through to a nuclear war in Europe. It was narrowed down for handling into a limited number of things, but in the extremes, there was little more than the type of thing in which the British spent all their time between World War I and World War II, involved in trying to keep the peace among warring tribes in various parts of the tropical zone, through to a nuclear war in Europe.

This study was to attempt to identify the kind of aircraft that, in fact, would be needed in the future in the Canadian Air Force if the Canadian Forces were to be assigned roles over this very broad front.

We studied all existing aircraft that were on the drawing board or in developments, at the time, and also the kind of operations you would have to do from the very sophisticated environment that you get in Europe to, in fact, the desert of the Arabian Peninsula, where there are virtually no navigation aids and virtually nothing even to navigate.

● 2030

When that study was over and a number of different ways in which two sophisticated forces would come together, or might have to cope with, or a single sophisticated force might have to cope with the tribal rebellion sort of thing, it was quite clear that at least two different kinds of aircraft, high performance aircraft, were required. One was a very sophisticated type of aircraft, an expensive one, of which the current example today is the F-4 in one or other of its configurations, the Phantom. At the other end, this study says, that what was really needed was a modern version of a late World War II fighter, the kind of thing that was just coming into service towards the end of World War II.

At that time the British said—because I happened to be in a position where I could talk to some of them out in the Arabian Desert at the time—that you wanted something like the hunter, where you could fly along, look out the window, and be able to count sand dunes as they went underneath, because you really could not use any of the sophisticated sensors and things. If you were going to see an Arab in the desert, you were going to have to see him, and if you flew by at mach 2 you would not see him, type of thing.

At the end of that study there was not, in fact an aircraft that really fitted into this lesser role. That particular study, I would suggest, had quite an influence on the decisions that were taken just after the White Paper, because one of the things that the White Paper was stressing, as I was saying earlier to Mr. Howard, was this peace-restoring area. This is where you encounter the less sophisticated environment and the problems of this less sophisticated environment. The F-5 Freedom Fighter was, in fact, an unsophisticated airplane in relation to the Phantom.

We were looking at that time—if you go back and look at the record, it is quite clear—for this concept of mobility, of being able to go into tropical areas where there was not a sophisticated environment; where you could not, in fact, count on having American pipe lines, or some other logistics line, that could keep you fed. It was in this context that this whole thing was set up. This is still the basic context into which the CF-5 is being fit.

Whether or not this will be valid a year from now will in very large measure be determined by the decisions that I believe are going to be taken within the next month or two. To attempt to forecast whether or not the CF-5 will have a role three years from now will be much clearer in month or two. I do not think that any of us sitting here at the table could really attempt to forecast for you what the situation is going to be as a result of the present studies that are being done for the government.

I am afraid we really have to leave it that way. I can give you the background information of how we arrived at these concepts and say they are applicable if you wish to accept them. If the concepts are not accepted, we always have a replacement trainer for this T-33, as General Adamson said. It is a good trainer because that is the purpose for which it was originally designed.

The Chairman: Mr. Guay, have you any questions?

Mr. Guay (St. Boniface): I appreciate your comments and I think that you have explained this very well. However, is it not rather a big gamble, considering the number of aircraft which will be acquired, when we are not in a position to say today that they will be made good use of, they are something which the Department requires, and they are something that is appropriate for our training program? And yet you seem, again, to leave us under the impression that it is not yet defined whether or not this will be the case.

Dr. Arnell: The decision on the CF-5, I must remind you, was taken over four years ago. It is just like saying we do not need the DDH-280's. Suppose they decide next month that we do not need the DDH-280s. Was the decision wrong four years ago?
